*Forglen, Banffshire.*—Mr. H. St. George Gray last year excavated the tumulus known as Rounie Law. A paper descriptive of the result will appear in the forthcoming volume of the Proceedings of the Soc. of Ants. of Scotland.

*Glastonbury.*—The final series of excavations of the lake village occupied seven weeks under the supervision of Mr. A. Bulleid and Mr. H. St. G. Gray.

*Grimston, Norfolk.*—The Norfolk and Norwich Arch. Soc. has excavated the site of a Roman villa under the advice of Mr. H. Laver, F.S.A.

*Kenderchurch, Herefordshire.*—Some excavation of the mound on Little Howton farm was carried on by Mr. T. G. Barnett in August, 1906, and will probably be continued this year.

*Lansdown, Bath.*—Further explorations of the site occupied by a Romano-British settlement have been conducted by Mr. T. S. Bush and others.

*London.*—In the course of excavation for the new Post Office buildings on the site of Christ's Hospital, portions of the wall of London have been found and many relics appertaining to Roman and later times were discovered. Numerous other excavations have yielded important evidence and have been summarised by Mr. Philip Norman and Mr. Francis W. Reader.

*Manchester.*—Excavations have been made by the local branch of the Classical Association on a site in the centre of the city, enabling the explorers, under the guidance of Mr. F. A. Bruton, to fix the line of the western wall of the Roman station of Mancunium.

*Manton, near Marlborough.*—In October last Mr. B. Howard Cunnington opened a barrow disclosing a skeleton and many valuable relics of the Bronze age.

*Melandra, Glossop.*—Further investigations of this important Roman station have been carried on by Mr. F. A. Bruton and Mr. J. H. Hopkinson, with interesting results regarding the plan of the headquarters building. The excavations have been conducted on behalf of the Manchester and district branch of the Classical Association.

*Middleham, Yorkshire.*—The Roman antiquities committee for Yorkshire has cleared the foundations of the Roman building and made a plan of the lines of structure disclosed. Some exploration took place many years since. (See *Journal*.)

*Newmarket.*—A tumulus of the Bronze age, on the hill

above Newmarket race-course, has been excavated by fessor T. McKenny Hughes.

*Newsstead, near Melrose.*—Excavations have continued without intermission, revealing much important information as to the conditions of life within the walls of this station.

*Penygorddyn, Denbighshire.*—The exploration of an ancient stronghold has been continued by the Antiquarian Society under the supervision of Mr. J. H. Gardiner.

*Pewsey.*—The area within the walls of this Roman fortress has been partially excavated by a committee of which Mr. L. F. Salzmänn is the secretary. Full details of the exploration will be published shortly.

*Ribchester.*—Mr. Thomas May writes:—"The results of the exploration recently directed by Mr. May at the centre of the well-known Roman fortification at Ribchester during two separate months, from November 12 to December 13 of last year, and from April 8 to May 9 of this year, were the uncovering of foundations and portions of the superstructure of the outer walls of the headquarters building (prætorium, or perhaps more correctly palace) for nearly their whole length upon the south-west and south-west sides as well as at the four corners, and there upon its other two sides."

*Silchester.*—Excavations, confined to the ground which occupies a considerable area near the middle of the Roman site, extended over six months, under the supervision of Mr. Mill Stephenson. It is hoped to bring to a conclusion the examination of the whole of the 100 acres within the town wall.

*Stoke Courcy, Somerset.*—Excavations of the barrow were carried on in April by Mr. H. St. George Gray, assisted by the Rev. C. W. Whistler and by Mr. J. H. Laver, Major, of the Viking Club. The barrow contained objects belonging to the Bronze age.

## CORN EXCHANGE, LIVERPOOL

THE committee controlling the Corn Exchange, Liverpool, entertained the idea of building new premises for the *Liverpool Courier*, and the splendid site offered by the George's Dock, so close to the present Exchange on Wick Street, has naturally attracted them. The site is now occupied are quite inadequate. They are cramped and entirely out of date. A change was considered inevitable, so irksome do the members of the present surroundings. The first idea was to rebuild on or near the present site, thus avoiding the question of a complete removal. This plan was much and at the time it was entertained the scheme was in this journal. There was a section, however, which favoured a bolder plan. The George's Dock was tempting. The example of the Cotton Exchange doubt has had some effect upon those who were in favour of forward movement. The matter has for long been in abeyance. The question of cost is a serious one. In the quarters there is a disposition to wait until a plan is found for the existing building, used as an exchange, question, however, could not be left open indefinitely. Consequently, the finance committee of the Corn Exchange have agreed not to deal with the site for some few years in order to give the corn trade an opportunity of rounding and making satisfactory arrangements for the building of a new exchange, which would not only increase and improved facilities, but concentrate the offices in one structure the offices of those connected with the Association. Although negotiations have not gone further than is here indicated, there are nevertheless the strongest hopes that a successful issue will be reached and that almost simultaneously with the rising of the Royal Liver Society's offices on the northerly site also be in progress the construction of a building which will be an honour to the city and a credit to whose enterprise and business instinct have produced the erection.

So greatly has the idea of a new Corn Exchange impressed the minds of those associated with the trade, it is understood that the Exchange Club are prepared to occupy a portion of the proposed structure when completed. The organisation, whose membership includes a large number of merchants in the city, is now housed in the Exchange Street. The building is not of a character quite in accordance with modern requirements. The club is a large and important one, perhaps second only to the leading political

The members have for some time been desirous of finding quarters more in accordance with modern ideas of comfort and convenience, and the suggested combination of the Corn Exchange in the projected scheme will amply secure everything they require. Of course, it is too early yet to speak of the design or the cost of the new building, but as plans will have—like the case of those of the Royal Liver Buildings—to be referred to the Corporation, there is every reason to hope that new structure or structures, whether occupied or separately by the Customs and Corn Exchange, will be worthy of the position.

## THE COUNTY HALL COMPETITION.

The following statement has been sent from the London County Council:—

The London County Council has received from Mr. J. Shaw, R.A., and Mr. W. E. Riley, F.R.I.B.A., the assessors appointed to act for it in connection with the competition for designs for the new County Hall, their report on the result of the preliminary stage of the competition.

The assessors state that there were sent in ninety-nine designs, the work of 152 architects, some of whom worked independently and others in collaboration. Of these architects, 107 were of foreign birth. To illustrate the designs, drawings were submitted.

The duties of the assessors were to select not less than 10 and not more than fifteen designs with a view to the selection thereof competing, with the eight architects already selected by the Council, in the final stage of the competition.

There was no doubt in the minds of the assessors that a maximum number (fifteen) of designs required could be found among those sent in. The names of the fifteen designs selected by the assessors are:—

R. F. Atkinson, F.R.I.B.A., Mr. H. J. Blanc, R.A., R.S.A., Mr. G. Washington Browne, Mr. T. N. A.R.I.B.A., Mr. M. J. Dawson, A.R.I.B.A., Mr. G. Fulton, Messrs. Gardner & Hill, Mr. W. Haywood, Mr. Houston, & Horne, Messrs. Jemmet & McCombie, Knott, Messrs. A. Marshall Mackenzie (F.R.I.B.A., A.) & Son, Messrs. Russell & Cooper, F.R.I.B.A., Warwick & Hall, A.A.R.I.B.A., Messrs. Clyde & E. W. Poley, A.A.R.I.B.A.

The names of the eight architects selected by the Council are:—J. Belcher, A.R.A., P.R.I.B.A., Mr. W. Flockhart, R.A., Mr. Ernest George, F.R.I.B.A., Mr. H. T. Hare, R.A., Mr. T. G. Jackson, R.A., Mr. E. L. Lutyens, R.A., Mr. E. W. Mountford, F.R.I.B.A., Messrs. Son & Corlette (Sir Charles Nicholson, Bart., M.A., R.A., and Mr. H. C. Corlette, F.R.I.B.A.).

Other architects of distinction were asked by the Council if they were willing to compete, but they were unable to accept the invitation.

The committee dealing with the matter desire, in the name of the Council, to thank all the competitors for the response made to the Council's invitation, and for the great amount of work and thought which has been expended in preparing the designs submitted.

Several competitors have written asking for explanations of the selection of their designs. To do this would practically require a report from the assessors on each design, and a departure from the ordinary course as the requests cannot be made.

## CROSBY HALL.

The following letter has been sent to every member of the Livery of London by Alderman Sir T. Vezey

*The Preservation of Crosby Hall.*

Sir,—The opportunity now offers itself to the City of London to show by their united action how fully they are in the universal desire that the beautiful old house known in the days of Shakespeare as Crosby Place, and more recent times as Crosby Hall, should be saved from impending destruction and secured for all time as the property of the nation in the City of London. The proposal that Crosby Hall shall provide a corporate home for the guilds (nearly fifty in all) as have been deprived of their halls in the course of the various improvements of recent years. The representatives of the

ancient guilds and modern associations could meet there for the promotion of the social, commercial and industrial interests of the community, which could nowhere be so appropriately focussed as in the City of London, and this grand old building would thus be dedicated to present and future purposes worthy of its great past. It is felt that it would serve a real need of the present time by providing a centre for the growing activities of the age, and so furnish another, and perhaps the highest, practical example of the adaptability of ancient institutions to modern needs. To this end it has been suggested that each member of the Livery should be asked to contribute a personal donation of one guinea, and every member of each Court of all the guilds should be invited to subscribe a personal donation of two guineas. If you are willing to concur in this scheme by making such a donation, and the suggestion is acted upon by every member of this great constituency, a sum of upwards of 8,500*l.* will result from this appeal alone—an amount valuable in itself, but even more important as indicating the widespread interest which is undoubtedly felt by this important body of citizens, who will be rewarded by securing for present and future use this priceless heritage, which has recently been described as "a Gainsborough or Reynolds in architecture."—I am, dear Sir, yours truly,

T. VEZEY STRONG.

Guildhall, E.C. : October 4.

All donations are to be paid to the account of the Crosby Hall Preservation Fund, Bank of England.

## BEAUTY IN ORGANIC FORM.

AT the opening course of lectures on physiology at Manchester University, Professor Stirling spoke on "Beauty in Organic Form and Function." He said beauty should be the equivalent of perfect health and a perfect organisation. Greek art was still referred to for our standard of physical beauty. For the representation of a divinity the finest models were sought, but the greatest artists did not confine themselves to copying the forms of beauty from any one person, for rarely or never was any body or even an organ faultless. He pointed out that the inner architecture of the bones of the human skeleton afforded to the engineer the solution of some of his most difficult problems, while the combination of stability and elasticity with perfection of function was nowhere better illustrated than in the mechanism of the human foot. The problem of floating in the sea had been solved by some of the lowest animals by means far more varied than those yet adopted by the physicists. Many of these surface forms, exquisite in their beauty in form and colour, held the secret of the cause of rhythmical beats. The expansion, growth and increase in size of a sea-urchin within its mathematically arranged calcareous box offered a problem comparable to the growth of the bones of the skull commensurate with the expansion and unfolding of the brain within. One of the highest triumphs of beauty, orderly sequence and co-ordination, was reached in the beats of the various chambers of the heart, the secret of which was to be found within its own walls. It beat before birth and before any nerve structures had grown into it. In its rhythm was to be found the secret of its power to keep on pumping in some cases long after the allotted span of three score years and ten. It did what many otherwise sensible people failed to do—it put in a period of rest, and therefore of recuperation, after every exertion. This year 1907 marked the centenary of the famous theory of colour vision by Thomas Young, which had made possible the reproduction of coloured objects by means of photography as exemplified by the Lumière Starch process.

The School of Art Wood-Carving, South Kensington, which now occupies rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the London County Council are vacant. The day classes of the school are held from 10 to 1 and 2 to 5 on five days of the week, and from 10 to 1 on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

## DEMOCRACY AND ART.

ON Tuesday the Bishop of Birmingham delivered an address to the members of the Society of Artists, Birmingham, on "Democracy and Art." At the outset his lordship remarked, according to the *Birmingham Daily Post*, that for about half an hour before the meeting he had been realising very painfully that he wished he were dead. One reason was he had to speak on a subject that, though he was chaplain of the Society, was not within his proper province. Another reason was, the idea he felt he would like to express when the engagement to address the Society was made months ago had become extremely hazy. It was not as though he were in the way of assisting the artist to live. In the present conditions of society the artist was, like some other people, in danger of being crushed under the wheels of the motor-car. Forty years ago, when the merchant or wealthy citizen built his villa at Edgbaston, the first necessity was that it should be well furnished, and that meant pictures. Therefore he patronised the rising artists, with more or less taste or success, according to his native faculty. Now the wealthy man bought cheap reproductions and motor-cars. His lordship felt nothing he could say could in any way alleviate the difficulty of the artist to make a living. The best he could attempt to do was only to contemplate an ideal which, he was afraid, at the present time was sufficiently remote from realisation to render it quite impossible of feeding any junior artist with the necessary bread. We were in a democratic age, but an age not distinguished by the possession of that sense of beauty which was meant by the title of his address. It was a good thing to realise our deficiencies. Art and democracy as an ideal was very far from us. In a great number of drawing-rooms they were confronted with the fact that in furnishing we were very far from anything except a mechanical uniformity of ugliness which, from every point of view, was the exact antithesis of art, which was individual as well as beautiful. They realised also that corporate bodies had not got at all near the point of thinking it part of their business to assist the artist to live. Corporations had done incredibly little for the encouragement of the artist.

*Ugliness in Churches.*

He was afraid, too, that almost the greatest of sinners in this respect at the present moment was the Church. They saw an amazing amount of brass in their churches—chandeliers and instruments for carrying light, altar rails, candlesticks, vases and memorial tablets. If art meant the use of some material so as to mould it to beauty and at the same time express some individuality of idea, all this profusion of brasswork was something quite opposed to art. There was no individuality about it all. If you examine a few price lists, said his lordship, you know exactly where each of these particular forms of ugliness comes from and exactly how much it costs. There had been, perhaps, some perceptible improvement in the matter of painted glass. They knew how extraordinarily exceptional were the windows in the cathedral church of Birmingham, because there they had the soul of a great artist expressing itself in colour. The idea that he had in his mind, the bishop continued, was expressed by Tolstoy:—"The artist of the future will understand that to compose a fairy tale, a little song which will touch, a lullaby or riddle which will entertain, a jest even which will amuse, or to draw a sketch such as will delight dozens of generations or millions of children and adults is more important and more useful than to compose a novel or symphony, or paint a picture of the kind which diverts some members of the wealthy classes for a short time and is then for ever forgotten." The region of this art was enormous, and was, as yet, almost untouched. There were certain spots in the world where we could still find, at least, the relics and remains of an art that grew out of the soil and expressed there upon the spot all the best and most sacred feelings that inspired the whole place. As an example his lordship went on to describe Bruges, which he recently visited, on account of the exhibition of the Golden Fleece. After a graphic description of the Flemish art of the fifteenth and sixteenth centuries, which, as visible in Bruges, was concerned with the common life of the people, domestic, civic and religious, his lordship pointed out that this was the artistic product of a people who, while commercially great, did not neglect the seemly and beautiful. He supposed, he continued, there was some art in seeing visions and dreaming dreams, but we were living in an age which seemed to have quite forgotten the duty of common life to the beautiful. Whatever had to happen

now must—and he rejoiced in it—represent the common life; but was the democracy to discard all on the whole, ridiculous, the idea of the duty of the life to be beautiful? Unless he was very much mistaken this appalling loss had actually occurred. Nine-tenths of the inhabitants of Birmingham thought it their duty to be rich if they possibly could, and that a man was so very near a fool if he supposed it was their duty to be beautiful.

*The Smoke Nuisance.*

If they were to have a new state of things, he thought they would have to go very deep, and that the change which lay at the root of such a possibility in our time involved some great changes. It involved the primary principle the duty of being clean, not only persons alone, but in the air. He did not believe they would ever get a civic sense of beauty until they had the respect which could only belong to a people whose atmosphere was clean. Year by year he wondered how people were content to live in an atmosphere of dirt without more vehement protests. He was informed a great part of the dirt which polluted the atmosphere of Birmingham could be prevented if only they cared enough. But they did not care enough; they kept the laws they had in regard to the smoke permissibly to make from their factories. Until they resolved to be clean they would not have taken the first step in the movement towards the duty of realising the duty of being beautiful. The first necessity was to be spacious. Then they should place beautiful objects and place them where they could see them. Further, if they were to have art in democracy, they must begin with common objects; they must start at the bottom and not at the top; and the art must be an expression of individuality. He knew what he was quite far off any practical realisation, but, from time to time, he thought it was legitimate to give utterance to a protest against the all-possessing dogma which degraded our common life, that it was the manifest duty of everyone to be as rich as he could at the expense of the common life. It might have to be trampled on in the way. The commercial cities of the Hanseatic League in the last moment thought it would be tolerable to prefer the ugly and not beautiful. He asked why it was not possible to recall ourselves to this ideal. If we were to recall to that ideal it must be first of all by laying broad the basis of the common human life out of which the art grows. There must be clean cities, cities of spaciousness, cities of beautiful public objects and cities of a dignified life.

Councillor Tonks, moving a vote of thanks to the speaker, said he had delivered an address such as had not been heard in the city for many a long day.

Mr. John Pratt seconded the vote of thanks, which was cordially adopted.

## BUILDINGS TO BE ERECTED.

THE Building Act committee of the London County Council have approved of the following plans:  
Theatre on a site abutting upon Praeger Road, St. Thomas Road, Islington (Messrs. F. Matcham & Co.).  
Enclosed porch and covered way in front of The Holland Park Gardens, Kensington (Messrs. H. Reinmann).

One-storey shops in front of Nos. 130 and 132 Green, Catford, Lewisham (Mr. W. Wilkinson).

Addition to St. Mary's Oratory, No. 32 Sydenham Road, Lewisham (Messrs. Johnson, Saul & Co.).

Additions to Blackheath High School for Girls, Blackheath (Mr. J. O. Smith).

Motor garage at rear of No. 28 St. John's Wood, abutting upon Lodge Place (Mr. H. Chatfield Clark).  
Bay windows, Northwick House, Maida Vale (Mr. Pilkington).

Buildings on western side of Brixton Hill, Lambeth town hall and Hayter Road (Messrs. Phillips, Walters & Williams).

One-storey shops in front of Nos. 1, 1A, Choumert Road, Peckham (Mr. W. L. Dowton).

Iron and glass shelter in front of the Wilton, No. 32 Wilton Road, St. George's, Hanover Square (Messrs. J. A. J. Woodward & Sons).

\* The names of architects or contractors who submit plans are in parentheses.

baptist church on western side of Bickersteth Road, Tooting (Messrs. J. Wills & Sons).  
One-storey building on the southern side of Coleridge Road, Fairhazel Gardens, Hampstead (Mr. C. Hall).  
Porch and offices at Archbishop Sumner's schools, Reedh Street, Kennington (Mr. A. H. Ryan-Tenison).  
Re-erection of Brockley cottages, Malyon Road, Lewisham (Mr. J. P. Briggs).  
Buildings on western side of Elmgrove, Peckham (Mr. Saunders).  
Iron and glass shelters along the Pantom Street and Linden Street frontages of the Comedy Theatre (Mr. Tomfield Jackson).  
Building on north-eastern side of Vauxhall Bridge Road, ending on north-western side of Edward Street (Mr. E. A. Taud).  
Buildings abutting upon Tottenham Court Road, Fitzroy Street, Whitfield Place and Warren Street, St. Pancras (Messrs. Seth-Smith & Monro).  
A building abutting upon Oxford Street, Duke Street Somerset Street (Mr. R. F. Atkinson).  
Addition to Clement's printing works, Portugal Street, 10 (Messrs. Emden, Egan & Co.).  
Addition to No. 2 Park Street, St. George's, Hanover Square (Mr. W. D. Caröe).  
Dwelling-rooms in Brunswick Hall, Whitechapel Road (Messrs. G. Baines & Son).  
House on south side of Smeaton Road, Wandsworth (Mr. G. W. Allen).  
Conversion of Rose and Crown, Acorn Street, Camberwell, into two dwelling-houses (Messrs. Style & Winch, Ltd.).  
Cartway and loading dock at Nos. 206-10 City Road, Nos. 1 and 3 Bath Street, Finsbury (Messrs. Lipton, & Co.), whereby the separation between Nos. 206-10 City Road, and Nos. 1 and 3 Bath Street, which together will hold 250,000 but not 450,000 cubic feet in extent, will in be by a horizontal floor.  
Uniting two factory buildings on western side of Cressy Road, Hampstead (Mr. F. S. Hammond).  
Openings in party wall between Nos. 8 and 9 Dover Street, Piccadilly (Mr. F. T. Verity).  
Additional storey to No. 8 Albany Street, Piccadilly (Mr. Willett).  
Building to exceed 250,000 cubic feet in extent on eastern side of Arklow Road, Deptford (Messrs. Stock, & Stock).  
Engine-room at the generating station, King's Road and Pitt Street, Camden Town (Mr. S. Baynes).  
Additional buildings in connection with St. Olave's Infirmary, Lower Road, Rotherhithe (Messrs. Newman & Vman).  
One-storey shops in front of Nos. 3 to 10 and 13 to 16 Edgale Parade, Garratt Lane, Earlsfield, Wandsworth (Messrs. T. Shepperd & Co.).  
Wood and tile porch in front of 41 Campden House Road, Kensington (Messrs. J. Barker & Co.).  
School hall, Oratory Girls' School, Chelsea (Messrs. Benson, Saul & Co.).  
Enlarged oriel, London, City and Midland Bank, Cornhill (Mr. T. B. Whinney).  
Buildings on site of Nos. 166 to 174 (even numbers) Acre Lane, Brixton (Messrs. E. J. Eadle & Myers).  
Addition to Home for Destitute Boys, Rectory Grove, Putney (Mr. G. E. Hutchinson).  
Building exceeding in extent 250,000 cubic feet in Evers Street and Alfred Place, Holborn (Mr. J. Slater).  
Erection of steps in front of 17 to 45 (odd numbers) Vera Road, Fulham (Mr. J. T. Brown).  
Building at Hythe Works, Willesden (Messrs. Hennell & Co.).  
Porches to twenty-nine houses in Danecroft Road and fifteen houses in Frankfurt Road, Herne Hill (Mr. W. C. Dard).  
Porch, bay windows and balconies, No. 1A Maida Hill Road, Paddington (Messrs. Taperell & Haase).  
Porch, 5 Cravenhill, Paddington (Messrs. Joseph & them).  
Porch and balcony, 25 Upper Brook Street (Mr. R. G. Hammond).  
Projecting columns, Bayswater, and balconies, 44 Curzon Street, W. (Mr. M. G. Hazell).  
Balcony and porch, 63 Brook Street, W. (Mr. G. T. e).  
Building over a portion of Adelaide Place, Strand (Mr. T. Wreathall).  
Two projecting circular bay windows to Nos. 4 and

6 Genoa Avenue, and projecting porches and sham half-timberwork to Nos. 4, 6, 8 and 10 Genoa Avenue, Putney (Mr. J. C. Radford).  
Buildings on south side of Oldridge Road, Balham (Mr. C. H. Cartwright).  
Building on south-western side of Swaby Road, Wandsworth (Messrs. Holloway Bros.).  
Building on eastern side of Auberon Street, Woolwich (Mr. W. Harris).  
Bay windows to Nos. 12 and 14 Beechill Road, Eltham (Mr. J. J. Barrett).  
Buildings on site of Nos. 708, 710 and 712 Old Ford Road, Bow (Mr. J. H. Bishop).  
Addition to St. Matthew's schools, Nelson Place, Islington (Messrs. Lovegrove & Papworth).  
Lift at rear of 28 to 34 Fortress Grove, Kentish Town (Mr. C. J. Shaw).  
One-storey building in front of 3 Pemberton Row, Great New Street, E.C. (Mr. R. M. Roe).  
Addition to Frognaal Rise, Hampstead (Mr. R. Unwin).  
Porch in front of St. John's Church, Plumstead (Mr. J. O. Cook).  
Building on site of No. 1 Chepstow Place, Bayswater (Mr. E. J. Stubbs).

### CONGRESS OF ARCHITECTS, 1908.

THE following preliminary programme of the International Congress of Architects, Vienna, May 18 to 24, 1908, has been issued:—

#### Monday.

Meeting in hall of the Architects and Engineers' Association.  
9 o'clock—Meeting of the permanent committee.  
10 o'clock—Distribution of circulars, cards, invitations, &c.  
From 12 to 2 o'clock—Public Opening of the Congress in the assembly hall of the Imperial Palace.  
3 o'clock—Excursions through the city; carriages, street cars by individual payments.  
8 o'clock—Reunion in the Künstlerhaus in the Fine Arts Palace; Entertainment by the Sculptural Society of Vienna.

#### Tuesday.

First Section in the hall of the Engineers and Architects' Association of Vienna.  
10 o'clock—Business meeting.  
Second Section in the Trades Union Hall.  
10 o'clock—Conferences with Professor Karl König and Mr. Bauer.  
3 o'clock—Visit to the Exposition of Prater. Excursion to Kahlenberg.  
Dinner given by the Austrian Society of Engineers and Architects.

#### Wednesday.

10 o'clock—Business meetings and conferences in the same halls in which the meetings were held Tuesday.  
3 o'clock—Excursion to Klosterneuburg and to the Chateau of Kreutzenstein.  
5 o'clock—Reception at the Imperial Court.

#### Thursday.

The entire day will be devoted to an excursion to Semmering.

#### Friday.

10 o'clock—Business meetings and conferences in the same halls.  
3 o'clock—Visit to the city library.  
8 o'clock—Reception in the Rathaus.

#### Saturday.

9 o'clock—Meeting of the permanent committee.  
10 o'clock—Closing meeting.  
3 o'clock—Promenades, visits, &c.  
8 o'clock—Closing banquet, the fee for which will be fixed later.  
The following subjects will be discussed at the Congress:—

#### I. CONTINUATION OF THE SUBJECTS CONSIDERED IN LONDON IN 1906.

1. State of Legislation on the Property Right of Design.
2. Organisation of International Competitions in Architecture.
3. The Legal Qualifications of an Architect.
4. Preservation of Public Architectural Monuments.
5. Reinforced Concrete Construction.

## II. NEW QUESTIONS.

6. The Public Administration of the Fine Arts; the Utility of, the Dangers of, and the Methods of Organisation.
7. To Safeguard the Artistic Interest in Municipal Building Ordinances.
8. The Modification of the Business Methods of the International Congress.

## III.—DISSERTATIONS.

The following dissertations and discussions have been announced:—

Prof. Karl Konig: The Influences and Tendencies of Modern Art on Architecture.

Mr. Leopold Bauer, architect: The Influence of Historic Styles on the Development and Forms of Modern Architecture.

Prof. Meydenbauer, Berlin: Measurements of Light.

Mr. Daumet, Paris: Discussion on the subject of Architecture.

## Further Strand Improvement.

SIR,—Though the improvements committee of the new London County Council have recommended that "no alteration be made in the present northern line of frontage in the Strand," and that the Council should refuse our offer for the right to erect a hoarding in order to demonstrate how buildings on that line of frontage would mar the thoroughfare, the Further Strand Improvement Committee cannot accept as conclusive the report submitted to the Council, and will continue its work until a more satisfactory result has been obtained. The work of the committee has already been extended over a period of more than four years, and has involved expenditure in excess of funds subscribed. To meet this and for the work yet before us we appeal for support to all who care for the future of our great Metropolis. Subscriptions may be forwarded to the honorary treasurer, Mr. Robert A. Smith, Palace Chambers, Westminster.—We are, &c.,

EDWARD J. POYNTER, President.

HENRY W. LAWRENCE, Chairman of Executive Committee.

MARK H. JUDGE, Honorary Secretary.

7 Pall Mall: October 8, 1907.

## Warning to Builders' Merchants.

SIR,—In the interest of merchants and others connected with the building trade, we should be obliged if you would kindly give prominence in your next issue to the following warning:—A man is going about falsely representing himself to be connected with this firm, giving orders for goods and instructions as to their delivery, and following on with a request for a loan of a small sum of money. We have had many complaints from merchants who have been victimised and put to considerable trouble and expense, and we should be glad to receive any information which may lead to the man's apprehension.—Yours faithfully,

GEORGE TROLLOPE & SONS AND COLLS & SONS, LTD.

5 Coleman Street, E.C.:

October 9, 1907.

## GENERAL.

Mr. William Orpen, A.R.H.A., has been appointed by the Department of Agriculture and Technical Instruction for Ireland as visiting professor of drawing and painting from life at the Metropolitan School of Art.

An Exhibition of about seventy water-colour drawings illustrative of the work of Mr. William Callow between 1840 and 1904 will open on Saturday, October 11, at the Leicester Galleries, W. Mr. Callow was born in 1812, and ceased work owing to failing eyesight in 1904.

Messrs. E. A. Woodrow & Horace J. Helsdon have removed from 67-9 Chancery Lane to 6 Raymond Buildings, Gray's Inn, W.C. The telephone numbers, 328 Holborn and 63 Finchley, remain unaltered.

The Surveyors' Institution will hold the first ordinary general meeting of the session on Monday, November 11, when the president, Mr. Thomas Taylor Wainwright, will deliver an opening address at eight o'clock.

The Dean of Winchester, speaking at Winchester Tuesday, said that he had received a serious reply from Mr. T. G. Jackson as to the condition of Winchester Cathedral. It had been impossible to obtain this information until the walls were opened, and it was now estimated that 86,000*l.* would be required instead of 60,000*l.* previously estimated. They had spent 24,000*l.*, and were 6,000*l.* in debt. They would do urgent work up to but after that dangerous parts would have to be left up unless the necessary funds were subscribed.

The Series of Lectures on William Blake, which was announced last week would be delivered under the auspices of Alexandra College Guild, Dublin, has been unfortunately postponed to a later date during the present session.

By the Will of the late Mr. John M'Kinney, of Glasgow, the Archbishop of Glasgow will receive 3,000*l.* for the new Catholic church at Crosshill, and the Very Rev. J. B. M'Luskey, of St. John's, Portugal Street, 200*l.* for the new Catholic church to be erected in Gorbals.

The Late Sir Wollaston Knocker, who for nearly 40 years was town clerk of Dover, has bequeathed to the Corporation of Dover all his old book-prints, documents and archives relating to the town and the ancient Cinque Ports.

The Works Committee of Aberdeen Harbour Commission recommend the appointment of Mr. Hugh Barr, a second assistant, to the position of assistant engineer in the room of Mr. William Simpson, who has been appointed engineer to the Sunderland Harbour Commission. His salary is 225*l.*, rising next year to 250*l.*

St. George's United Free Church, Edinburgh, has been reopened after being closed for a period of two years during which the interior has been entirely cleared and redecorated from the designs and under the personal supervision of Sir Rowand Anderson.

At a Local Government Board inquiry into an application of the Cardiff City Council to borrow 50,000*l.* for lunatic asylum, exception was taken to an expenditure of 2,000*l.* for a lodge and 1,408*l.* for a steward's house, which it was claimed was extravagance.

At the Last Meeting of the Court of Common Council was resolved that, in view of the great public appreciation of the special exhibitions held in the Art Gallery since the year 1890, it was desirable that an exhibition should be held in the summer of the ensuing year, and that the matter be referred to the library committee to make the necessary arrangements at a cost not exceeding 450*l.* The Chairman remarked that since 1890 exhibitions had been held every year except three, and the visitors had numbered 3,000,000.

The Cheshire Education Committee approved on Monday an estimate of the cost of providing a new college for ex-bursars which was presented. The estimate provided 3,000*l.* as the cost of the site, 6,000*l.* for the building and equipment of a college for 100 students at 60*l.* per head, and 3,000*l.* for the provision of a hostel for fifty students per head. A sub-committee was appointed to look for a suitable site for the college in Crewe or in the immediate neighbourhood.

The Provisional Committee for the preservation of Crosby Hall met at the Guildhall on the 7th inst. under the presidency of Sir T. Vezey Strong. Upon consideration of a communication from the Society for the Preservation of Ancient Buildings, the committee decided that a trust should be created securing for permanent public advantage the preservation of Crosby Hall and its use in connection with the advancement of the work of the City Guilds and other bodies having kindred objects. It was further decided that provision should be made for the building being open for public inspection under suitable regulations. The directors of the Chartered Bank of India and China granted an extension of time to the 15th inst. for the completion of the purchase, and it was decided in the meantime for funds to notify guilds and other bodies not later than that date of the circumstance.

Mr. W. F. Stanley, to whom architects and engineers are indebted for many useful instruments, received on Monday the honorary freedom of Croydon, in recognition of his munificence in founding the Stanley Hall and Technical Trade School.

Mr. Edmund Kirby will on Monday next deliver a public address to the Liverpool Architectural Society.

Mr. Philip Norman, F.S.A., will deliver a lecture on the evening at the Camberwell School of Arts and Crafts on "Old London Churches and Houses."

## THE WEEK.

was general satisfaction in London when it was announced that a second French offer for the Crescent site had been accepted by the London Council. To have an area of 124,000 square ft upon out of the terrible wilderness which has long a time pained the eyes of all who pass was a thing which was almost enough to give rise to public rejoicing. Unfortunately, the second French offer has proved to be as unsubstantial as the first. All the offers seem to be satisfactory with the exception of one for £5,000 within a fortnight. The improvements were anxious to avoid another fiasco, and at last to time they extended the term for payment. But official patience has been at length exhausted, and on Tuesday it was resolved to rescind the resolution of July 23. It was asserted that one obstacle is to be found in the existence of the church of St. Mary-le-bow, but it will require a long struggle before that is sacrificed.

In 1898 the Metropolitan Asylums Board adopted a resolution to the effect that, provided the surveyors were to guarantee the accuracy of their quantities, bills of quantities form part of the contract in all building contracts. This was an exception to the usual practice, and at the time gave rise to some discussion. Opinions, of course, varied, for there can be no question that the connection between the bills of quantities and contracts is a subject on which neither architects nor contractors are all agreed. After nine years' experience the existing works committee have reached the conclusion that the resolution of 1898 should be rescinded. They declare that the treatment of quantities as part of the contract has not proved economical, and, moreover, it allows contractors to claim in instances where the quantities appear correct though they would not voluntarily give credit for there was excess. The change has been made only after serious consideration, and it will be supposed, be without its effect upon those who have arranged the arrangement most generally favoured by the public at the present time.

Perth Town Council some time ago arranged a competition for altering the town hall. Several designs were submitted, premiums were awarded, and one design was pronounced to be accepted. But the work was not carried out, mainly owing to the probable expense, which was the very small amount stipulated. The necessity for a new town hall became more evident, and it was decided to increase the amount available to £25,000. The plan is to include the cost of a large and a small hall, and furniture. Another competition is to take place which will be open to architects living in any part of the United Kingdom. The prizes to be offered are £500, £300, and £200. The authors of the three best designs in this first competition are to be invited to take part in this competition, and to receive £200 if he accepts. Mr. J. J. BURNET, F.R.S.E., is to be assessor, and will prepare the conditions. It is the intention of the Council in the course of the year to purchase the property surrounding the site, and to lay out new streets on either side as well as a square

works wonders," but it is not often so interesting. A year's work is accomplished as is to be seen at the Abbey. Soon after midnight on October 19, a fire arose in the Latham chapel, and on Saturday, October 19, 1907, the dedication service will take place. When we consider the work which was necessary in so important a

work of architecture and so historical a building, it is creditable to the architect, Mr. J. O. SCOTT, to Mr. ULLATHORNE, the contractor, and to the workmen that so much has been accomplished. It must not be supposed that the work was confined to the nave. In the other parts of the building much has been done, but it was thought desirable to utilise the nave for the ordinary services, and that aim has been realised. The restoration committee are so well satisfied with what has been done that it was lately proposed to restore the tower to a greater height than it had reached at the time of the fire. One of the incidents of the fire was that the clock continued working for about two hours, and not until the flames ascended to the works was there a stoppage. The time was 2.7 A.M. Towards the restoration a sum of about £36,000 has been obtained. But it is estimated that an additional sum of £12,000 will be required. The dedication will be an historic event, and it is doubtful whether at any other time so much restoration was accomplished within a year.

THE difficulty of carrying out the sections of the London Building Acts Amendment Act of 1905 has been again exemplified in the case of a building in Beech Street, which came before the Tribunal of Appeal on the 11th inst. Mr. P. B. TUBBS, the architect, said he was unable to obtain the consent of owners of the adjoining property to allow ladders or balconies as a means of escape to be erected. He had not adopted "smoke lobbies," as from his experience of them he did not believe in their efficiency. Reasonable means of escape had, however, been introduced. On behalf of the County Council it was said that the requirements of the Act were not complied with, and the Council's alternative proposals were not adopted. The members of the Tribunal of Appeal had examined the premises, and they allowed the appeal, awarding Mr. H. T. TUBBS 60 guineas costs. This, we believe, is the third case in which the Tribunal has allowed an appeal against the order of the County Council.

WHAT is known as the Isle of Purbeck is valuable in a geological sense, the stone being used for a number of purposes. At one time also the marbles were much employed in Gothic churches, but latterly they have been supplanted by foreign and other varieties. A case which was heard in Wareham County Court suggests that some old-fashioned customs still prevail in the district. The Bishop of WORCESTER claimed 50% from a quarryman at Swanage, on account of moneys due in respect of stone taken from quarries at Herston Farm, belonging to his Lordship. The defendant had been quarrying stone on the farm at three quarries, and he had not paid anything on the stone he had taken for a very long period. The quarrymen at Swanage claimed, by an ancient custom, the right of going on to the land of the plaintiff and of other landlords in the Isle of Purbeck and taking stone out of the quarries on condition that they paid royalties or dues, and defendant, it was alleged, had not paid any since 1887. Defendant, on being written to for particulars of the stone taken from the quarries since that date, first said that he could not possibly give the information, as the accounts had been either destroyed or mixed up with those relating to stone removed from another quarry. Subsequently, however, he wrote that his account of dues owing, "as near as he could get at it," was £31. 15s. 9d., which he paid into Court. In view of the defendant's admission, the judge said he must order the account to be furnished, and directed the Registrar to certify the balance due, the question of costs to be reserved until the next court in December. In the neighbouring island of Portland there are several privileges claimed by the quarrymen which are not in keeping with modern business arrangements. They are suggestive of a time when the stone was mainly used for local work, and owners therefore did not insist on their rights.

## INTERNATIONAL EXHIBITIONS.

WHEN the Board of Trade appointed a committee consisting of Sir ALFRED E. BATEMAN, K.C.M.G. (chairman), Mr. A. WILSON FOX, C.B., Mr. C. A. HARRIS, C.B., C.M.G., the Right Hon. Sir JAMES KITSON, Bart., M.P., Mr. ALGERNON LAW, Mr. MALCOLM RAMSAY, C.B., Sir SWIRE SMITH, Sir ISIDORE SPIELMANN and Mr. S. J. WARING to inquire into the benefits which this country derived from taking part in international exhibitions, and whether they were worth supporting and could be made to yield more advantage, the conclusions to be arrived at might easily have been foretold by anyone whose business it was to study such displays. In the first place, it cannot be doubted that as time runs on each exhibition shows signs of deterioration if compared with its predecessors. Human nature is weak, and to "do" an international exhibition is almost as onerous a task as reading through an encyclopædia. JOHN LEECH was able to turn the Exhibition of 1851 to account by suggesting how his languid swells derived gratification from such a revelation of industry. Yet in Hyde Park there was the great influence of novelty, which could not be repeated.

Shrewd entertainers were able to realise that the majority of people wished to amuse themselves, and in that way a large number of frivolous excrescences or "side shows" began to appear around the buildings which were devoted to science and art and the latest inventions. From the variety of people who were engaged it might easily be imagined that the promoters of an exhibition considered it was advantageous for visitors to go through a practical course of ethnology. Even when an effort was made to elevate spectacles that were often degrading by framing them in examples of ancient and barbaric architecture, there was little change in the character of the entertainments.

An exhibitor who had gone to great expense in sending machinery or costly products abroad could not help feeling mortified when he saw crowds of people watching the tricks of semi-savages while his own and other stalls no less interesting were neglected. Much of the prejudice which exists among exhibitors of the right class is due to the success of spectacles which are not evidence of progress. But the authorities of exhibitions, in defence, argue that the money derived from performances however contemptible is not to be despised, for it is necessary in order to supplement the rent received from people whose names are inscribed in the catalogue, in order to meet the enormous expenses which are inevitable. They also say that the public have become so accustomed to side shows no exhibition committee, however exalted, could refuse to exclude them.

Exhibitors—and we refer only to those whose productions are worthy of serious consideration—are also disappointed when they find that few orders are given to their agents. Goods may be of the highest quality and may be arranged with skill; they may also be admired, but real business is rarely transacted. We consider that the test is too exacting. In an international exhibition rivalry is on an extraordinary scale, and it requires some time for consideration before a decision is arrived at about the objects which are best deserving of selection. We speak, of course, of the classes of goods which are costly. Many exhibitors now realise that orders are not to be expected the moment a stall is examined. One of the witnesses before the committee was asked whether he derived any benefit from one of the numerous exhibitions in which he took part. He replied:—"It is impossible for me to say positively yes or no. We cannot trace anything directly to it. If you advertise in a certain paper, it is impossible to say whether you get any particular benefit from advertising in that particular paper; but you do get a benefit from advertising all round, most assuredly; it is the life of trade." Those who do not obtain orders immediately are disposed to undervalue exhibitions and to treat them as hopeless means of profit, although

involving considerable expense. But, on the other hand, it may be concluded that the eventual results are tenuous.

If exhibitions are to succeed it is absolutely necessary that a more perfect organisation should be than hitherto. It is impossible nowadays to do a business matter without introducing German methods. As Sir W. H. PREECE said, the German modes of business is far ahead of us, and that is carrying away so much of the trade from us. One witness related his own experience. He sent over valuable scientific instruments. The position assigned to him the heat was so great that some of his delicate thermometers burst. The Official Commission paid no attention to him and neglected the exhibitors all through. The committee, on the contrary, appointed a special man to look after similar objects, and he was at his long to give practical explanations. The witness not only his goods but his packing-cases were taken apart and he had to make long journeys in order to cover them. At Chicago the German Consular clerks put under him in order to act as exhibitors, and in consequence they obtained a great number of orders. Suppose a German exhibitor was to speak English and someone came to buy his goods, the clerks acted not only as interpreter but also as salesmen, and that without cost to the exhibitor. A witness who was a transport agent and a shipping agent, and as such was connected with several international exhibitions, and had taken part in the organisation of some of them, said that many of the firms would have taken part in the Paris Exhibition of 1900 if it had not been for the officialism.

The committee recommend that the Government should provide in future continuity of organisation from exhibition to exhibition. Sir H. T. DIXON said that it should be connected with the Board of Trade and that a capable man should be appointed as a permanent commissioner. He considered that the late Sir JOHN OWEN and Sir HENRY COLE were typical of the kind of men who were appointed. But to insure the success of international exhibitions the co-operation of the Society of Arts, the Chambers of Commerce is indispensable. The Government should be allied the principal manufacturing firms should happen to be outside those bodies.

The committee regard international exhibitions solely in the light of advertisements for the country. The same rule applies to empires as to individuals. They point out how "experience has shown" that in the case of firms with an established reputation and world-wide connections, attempts to do business by advertising have usually been followed by a large increase in the sales effected, and we cannot but think that neglect by Great Britain of one of the most powerful forms of national advertisement would be detrimental to her interests as a trading country." It can, therefore, be assumed that an international exhibition should be held in London, and that capital, Great Britain will be better organised for co-operation than in some recent cases.

It is sometimes said that this country has lost its position from exhibitions because foreign rivals have imitated English machines and other inventions, and that inventive power. That might have been true in 1851. But the industrial world has enlarged since that time. Foreign inventions are their own against British not only abroad but in this country. Indeed, a similar objection has been raised about Englishmen copying the inventions of foreigners. Besides, applications of power can be seen in places besides exhibitions. The public are on the look-out for novelties know them and are rarely disappointed.

The question of awards is one of great importance. Some exhibitors set a value on the medals while others can afford to be indifferent. There have occurred where medals of the

warded although the goods which were to have won them had not reached exhibition buildings. With so large a number of to be examined juries are often pressed for time, published firms receive greater attention than of inferior degree, although the latter may be ted by what is more interesting and valuable. be denied that in some cases agents profess not be able to obtain medals, but are willing to accept payment by result, a gold medal being a higher rate than one of silver or bronze. If was ten guineas for a bronze, twenty for a and thirty for a gold medal. But in spite of all tions, there are many who are in favour of the of medals. The Lord Chief Justice, who has twenty years' experience of exhibition com- declares there must be some recognition or dard of award, or else the manufacturers say, ily have nothing to show for any successful e have sent."

l be seen from the evidence printed on another t works of art are in a somewhat doubtful in the international exhibitions. When English were first seen in Paris French artists were not only at finding that Englishmen could paint, their pictures were purchased, and the British became more remarkable on the latter account the former. All the principal pictures were l in consequence the courage of English became exalted in the eyes of foreigners. eeding exhibitions had also to depend mainly s. Industrial exhibitors have never, to our ge, grumbled because English painters were not d to pay for the wall spaces occupied by their or it was believed that pictures, from their eness, were not without advantage to every of the English section. But it is now evident, remarks of some of the committee who have estigating the subject of exhibitions, that there be no exceptions. It is not, however, likely e future any change will take place. Painters ot pay; and there is less probability of the of pictures agreeing to be mulcted for helping d the reputation of Great Britain. The subject er, curious as suggesting the new spirit which ng up and by which all classes are placed on ty as regards disadvantages.

### FRENCH CATHEDRALS.\*

water-colour drawings of Mr. MARSHALL are ll known and merit the admiration they re- they display courage as well as artistic skill. e afraid to take any street in London and out ill make an attractive picture. This is not, solely due to the buildings. Much depends sky and on the figures in the streets. Mr. L is not to our mind an architectural enthu- e is satisfied with giving a general impression ding and does not labour over much on details. g may be the principal element of one of his , but it only, as it were, receives its due pro- f attention, for other elements have also to be ith justice.

therefore, a windfall for amateurs to receive than sixty reproductions of Mr. MARSHALL'S French towns, a cathedral generally forming a t feature in each. The originals were all y worked up to the extent we see on the for they retain an open-air look rather than oriousness. Another advantage they have is y suggest by their colours the sketch-book f the printing office. Modern colour illustra-

tion depends mainly on making a very few colours serve for the infinitude of nature, and in consequence a great many unsatisfactory appearances are produced. The plates from Mr. MARSHALL'S drawings are more pleasing than the majority of those which appear in modern books, indeed, it may be said that no two of them are suggestive of the same state of the atmo- sphere, and this variety is well adapted for such a country as France.

In the old days, when TURNER, STANFIELD, ROBERTS and PROUT brought out their beautiful landscape illus- trations, they were careful to avoid all responsibility for the letterpress of the "Annuals" in which they appeared. That work might be done by writers who were not on the same level as the artist. The reason is that, in spite of the appreciation of universality of knowledge and versatility in England, we believe in specialists. Like the Greeks, we expect the maker of sandals not to soar in his criticism beyond the feet of the statue. It may happen there will be a difference between the text and the illustrations of a book when two men are engaged in it, but that does not affect the value of either. Although TURNER was doggedly silent, he could not help exclaiming against the wonderful qualities which RUSKIN found in his pictures. It would perhaps have been better for us if TURNER explained how much was imaginative in his works, and why on certain occasions he took the privilege of endeavouring to go beyond nature. Architects would be pleased if Mr. MARSHALL frankly expressed his own judgment as a painter upon the French buildings he made the subject of his drawings, and he could not probably be over- detailed. As a rule he avoids giving what the majority of his readers would we imagine most desire. "Our business here," he writes, "is with the cathedrals and the historical side of the towns rather than with the lighter points of view." In literature the fullest freedom should be allowed, and there is no reason to prevent Mr. MARSHALL, if he cared, taking up the statistics of the cathedral cities as well as their histories. But by doing so the personal equation which is found in the drawings has to be absent in most cases. For the historical events he is compelled to depend on earlier writers, and when cathedrals are treated as examples of construction a great many architectural authorities have to be consulted and relied on. When OLIVER GOLD- SMITH imagined a time of rest for himself after his servitude to the publishers, his highest enjoyment was to relate to the people of his native village "all he felt and all he saw." Authors who are not professional should try to imitate him when they write. Mr. MARSHALL'S drawings are evidence of what he saw, it may be only by a hurried glance. If his pages would only suggest what he felt, his book would be perfect.

There are occasional paragraphs which indicate how well he could do what we desire. Take one example. Many architects have been puzzled when they first saw the ex-cathedral of Laon. But they have read so much about the enthusiasm of the builders who were able to accomplish so large a work in a short time, they have hesitated to say that it is not a building which is worthy of imitation. They will be more assured when they find that a painter of buildings was not fascinated by such massive uncouthness. Mr. MARSHALL'S impression is therefore worth recording:—

From the distance it has more the appearance of a chateau than of a church; its nave is low when compared with other Gothic naves, and its general outside appearance shows evidence of something brutal and savage; and as far as its colossal sculptures of animals, oxen and horses, which appear to guard the upper parts of the towers are concerned, they combine to give an impression more of terror than of a religious sentiment. One does not feel, as one regards Notre-Dame de Laon, the stamp of an advanced civilisation, as at Paris or at Amiens. Everything is rude and rough; it is the monument of a people enterprising and energetic and full of great virility. They are the same men as are seen building elsewhere in the neighbourhood—a race of giants.

*Cathedral Cities of France.* By Herbert Marshall, R.W.S.,  
er Marshall. With sixty illustrations in colour by  
Marshall, R.W.S. (London: William Heinemann.)

Mr. MARSHALL says his book was put together during five summers, and his chapters are not intended to mark out any definite geographical scheme. The course followed is therefore somewhat zigzag, and it would have been preferable if some recognition of the French schools of architecture had been considered necessary. But we need not say that no matter in what order they may be arranged in the pages, Rouen, Chartres, Périgueux, Sens, Bourges, Paris, Coutances, cannot fail to possess interest for the student of art as well as of history. But the history can be obtained in a great many books, while a traveller like Mr. MARSHALL is not met with every year, and it is allowable to desire that when he enters on authorship he should refrain from following in the steps of other men.

No doubt almost every cathedral town in France can offer a "strange eventful history." They enjoyed independence to some extent, and that was an advantage in one way, for it placed some restriction on the combativeness of the race. It also promoted emulation, and at the present time a provincial town in France can aid clever but poor inhabitants with subsidies to an extent which would not be allowed in England. The French cathedrals are instances of the benefits which arise from competition among rival districts. As a kingdom France may have suffered through the partial independence of the cities, but owing to the peculiar character of the race it is by no means certain whether consolidation would have been advantageous at a much earlier period either to the people or to their neighbours. At the present time the centralising power appears indifferent to the fate of the cathedrals, and the dioceses have so long been passive they now seem to be unable to take any measures for the protection of the buildings. But whatever may happen the drawings by Mr. MARSHALL will suggest how much beauty had survived in the exteriors of the cathedrals—for it is a peculiarity of his talent to neglect interiors—and how in the twentieth century people continued to assemble near their porches as if they were still refuges and asylums.

#### THE LATE W. L. WINDUS.

IT might be imagined that when an artist was described by Ruskin as one of the chief leaders of the pre-Raphaelite school, who might one day take highest rank among masters of expression, and whose works were said to be among those that will hold their own with the most noble pictures of all time, he was likely to attain prosperity. That was not, however, the fate of William Lindsay Windus, the Liverpool artist, who died last week at Denmark Hill, S.E. Dante Rossetti also was of opinion that his "Burd Helen" was the finest picture in the Academy exhibition of 1856, while Ruskin considered it was the second best. A year or two afterwards Windus withdrew from the world, and there was much surprise when three incomplete works by him were seen in 1896 at the New English Art Club.

In the *Liverpool Courier* is an interesting memoir of the artist (probably by Mr. Dibdin, the curator of the Walker Art Gallery) from which we take the following:—

Windus was born, probably in London Road or Monument Place, in 1823. His family had long been resident in this part of Lancashire, his great grandfather having been vicar of Halsall, near Ormskirk. His mother was a Scotswoman, not improbably of the clan Lindsay. Art apparently did not come by heredity. At any rate, until he was sixteen years of age young Windus knew nothing about it. William Daniels came to paint a portrait of his stepfather, and the lad looked on with much interest, which gradually grew into a desire to try what he could do. The stepfather's father, retired from active services in life, was readily available as a model, and the chalk drawing which resulted astonished the family, and even arrested the attention of Daniels. That erratic genius volunteered to teach him to draw, but young Windus found great difficulty in keeping him to his bargain; his convivial tendencies constantly interfered. The pupil, however, was receptive and eager, and by tracing his teacher to various Temples of Bacchus got many stray hints and suggestions which

helped him, and he also studied pictures which lent him.

After making considerable progress the young man entered the antique school of the Liverpool Academy, and attended the life school established by Herbert J. R. Herbert, R.A., who kept a colour shop in the city. As early as 1842 he exhibited a "Portrait of a Gentleman" at the Liverpool Academy Exhibition, and in 1843 he contributed his much admired "Black Boy." Meeting other clever young students he soon became a prominent promise in the Liverpool art world, and secured admission into the artistic circle of that famous art patron, Mr. Miller, who kept a sort of open house for artists more than any single man to bring about the period in the history of art in Liverpool which is regretfully spoken of as "the palmy days." Windus exhibited "Falstaff Acting King Henry" first of the romantic genre subjects which for a time filled his imagination. This was succeeded the following year by "Touchstone Denominating the Lie" and "The Little Loiterer," and in 1845 "Morton before Claverhouse at Tillietudlem" the last for which is in the Walker Art Gallery.

In that year he was elected an associate and the following year a full member of the Academy, his election to that exhibition being "Reginald Pole and Henry VIII. against the Divorce of Catharine of Aragon." This was followed in 1849 by "The Interview of a State, Shaxton, Bishop of Salisbury, with Anne Boleyn in Prison." In the two following years he exhibited "The Execution of Mary Queen of Scots" and "The Execution of Mary Queen of Scots." In 1850, at the suggestion of Miller, who to him, as to other young aspirants, was untiringly kind, he visited London, where, among other examinations, he visited the new pre-Raphaelite school, he saw "The Shop," by Millais. The *Times* found that picture "interesting and disgusting," but Windus thought otherwise, and on returning to Liverpool, he seems to have sown the seeds of revolt among the younger artists of the town.

Thus began that battle in Liverpool for the overthrow of Raphaelite heresy which had such momentous results. The prize in 1851, and again in 1853, was won by Holman Hunt, Millais had it in 1852 and 1857, and Brown received it in 1856 and 1858; while other prizes were Mark Antony in 1854, Egg in 1855, and "The Girl" in 1857 in combination with other circumstances brought matters to a crisis. Herdman, who was a member of the Academy, not altogether voluntarily, had influenced the Corporation, which withdrew its support. An exhibition was opened, and the two exhibitions were each other to make room for the Corporation authorities.

Reverting to the Academy's years of prosperity, Windus reappearing as an exhibitor in 1851 with his brilliant work "Darnley Signing the Compact with the conspirators previous to the Murder of Rizzio," now the property of Mr. A. Bain, of Glasgow. In 1854 he exhibited "Portrait of a Gentleman" and "A Scene in the Surgeon's Daughter": Middlemass's Interview with the Parents," of which Mr. James Smith, of Blundell, is the present owner. There is no distinct trace of Raphaelite influence in the Darnley, but the new school were sufficiently used to injure the prospects of longevity. Dante Rossetti is said to have remarked of Windus at this period, "He paints what he needs any change."

Windus next exhibited at the Royal Academy in 1856, his first appearance there, and the one which is generally regarded as his masterpiece, "Burd Helen." This was entirely pre-Raphaelite in all. It was badly hung, and Ruskin (or rather one should say underlooked) it. Rossetti, who had an eagle eye, pointed it out, with that Ruskin, in a postscript to his famous "The Great Hall at Hampton Court," amplest justice to what is certainly a wonderful picture. He classed it as "the second picture of the year, being higher and its reserved strength greater than any other work except the 'Autumn Leaves.' It certainly lavishes praise, considering that 'Autumn Leaves' and another picture by Millais were pronounced to be achievements which 'will rank in future among the best masterpieces.' A considerable measure of

ed. The picture was exhibited at Edinburgh in 1858, idly enough, it does not seem to have been shown in school. There is a legend to the effect that Windus withheld it in 1856 or 1857 lest it should injure the prospects of Brown or Millais. He did not exhibit it again until 1859, when his "Too Late" was shown. It had been at the Royal Academy. This is more senselessly pre-Raphaelite than its predecessor, and its approximation to the manner of Millais in colour may have been the occasion of its curt dismissal from the Academy as a failure. Millais just at that time was in disgrace with the peppery critic. Windus never exhibited at the Academy, and tradition declares he was stopped short in his career by so severe a rebuff from the critic he esteemed so highly. This is pure nonsense, or at any rate a gross exaggeration. The picture, however, remains that with the exception of one and exquisite picture ("The Outlaw," now possessed by the Albert Wood) shown in 1862 at Old Post Office he seems never to have exhibited again.

Incidents in the artist's private life were probably the real cause of his most regrettable defection from the art world. Windus married a sister of the artist Robert Tonge, of Preston. She died in 1862 after a long and terrible illness, leaving him with one daughter, who survives him. In health and broken in spirit, Windus removed to the Dale, near Preston, where his surroundings were such that for several years he did not find it possible to devote himself seriously to art production. When things improved the desire to paint had so dwindled that Windus again produced an important finished picture. Unfortunately, he had an income sufficient for his simple life, and for more than forty years past he accomplished his work although painting as a pastime was never wholly abandoned. Grown morbidly fastidious, he destroyed what he produced, and such fragments as remain to represent the production of four decades have been saved from destruction by commendable petty larcenies on the part of his friends. When, about a quarter of a century ago, Windus returned to London he made an immense bonfire of his sketches and studies, being of opinion that "nobody cared for them." Since then he has lived in seclusion, content with the society of his intimate circle and his books, painting in the humour and especially during his customary visits to his lifelong friend, the late D. A. William-Broughton-in-Furness.

In addition to the works of Windus already mentioned, his too scanty achievements in art include the exquisite colour "The Flight of Henry VI. after Rowton," "Mont Willie," "The Patrician, Anno Domini 60," "The Second Duchess," "The Young Duke" and many more, endeavouring to obtain a confession of guilt from Queen Catherine Howard." The study for this last picture, recently secured by the Walker Art Gallery, which, however, is still sadly in need of a more adequate representation of a man who in genius, if not in achievement, may safely be described as the greatest artist that Liverpool has produced.

## ARCHITECTURE IN LIVERPOOL UNIVERSITY.

The Dean and the Professor of Architecture have sent the following letter to the local papers:—We ask the favour of your columns to announce to parents who are thinking of starting their sons in life as architects a new course which the university is taking this session. It is for registering students for the first time for a distinct course in architecture entitled Bachelor of Architecture (B.A.). A similar degree is given in America, but only for a purely theoretical course. In this country the University of Liverpool has not hesitated to be the first to give such a degree. It has, however, also decided, with the approval of the Royal Institute of British Architects, to require from candidates not only three years of theoretical study in the university, but also a further period of two years to be spent in practical work, either as an articled pupil to an architect of standing or as an assistant in an office. Thus the course will correspond to the medical course, in which practical work in a hospital is the theoretical work in the university. The initiation of a new degree scheme will not, of course, bring to an end the ordinary professional two-years' course which has been conducted by the university, and on which certificates are awarded. It is intended for those students who are prepared to equip themselves by a fuller course and a more elaborate training.

The practice of giving architectural students, like the students preparing for other professions, a wide theoretical training in a fully-equipped school, before binding them by articles from which there is no release, is steadily growing and has the cordial sympathy of the leading architects. In London a large majority of young architects are thus trained. One London school, founded confessedly in imitation of the Liverpool school, already numbers eighty students taking a full two-years' course, while on the Continent and in America the same practice is almost universal.

The combination of theoretical training with articled pupilage, which the university is anxious to establish, presents many practical and educational advantages.

1. At the outset the student gains a wide view of the possibilities and nature of his art. He has the practical problems of construction and design explained to him in a way which is not always possible in a busy office, where he often has to be left to pick up his knowledge as best he can. Thus, when he enters upon his pupilage he is able to take the full advantage of his opportunities and to understand what is going on in a way that would otherwise be impossible.

2. In a school the student is taught to design a series of structures of graduated complexity. In an office for several years the untrained student is naturally able to do little beyond tracing the designs of his seniors. Every year pupils in offices present themselves at the university to attend one or two courses in the intervals of their office work, so to obtain some degree of the necessary theoretical training, but in this way they are seriously handicapped in comparison with students who are able to devote their whole time to their work. They have realised too late that practice is most profitable when it is based upon a sound understanding of theory.

3. The school course enables the student to discover in what direction his inclinations and talent lie, and he is thus able to choose a master for his period of pupilage who is engaged on the class of work in which the pupil is likely to be able to do well and to be serviceable to his chief. Students of exceptional promise are enabled, by means of travelling scholarships, to measure and draw at the end of their course the finest examples of architecture, and thus to improve their talent to the utmost before beginning to practice. Last year the funds thus allotted amounted to £1100, divided among four students, who will shortly proceed to Italy.

These very real advantages of a combination of academic training with office work are fully understood by architects. The chief architects of Liverpool have very warmly recognised them, and have agreed to take students who have gone through a university course of training at a lessened premium and for a shortened period of articles. But parents have scarcely yet realised them or grasped how much their sons will suffer if they miss the opportunity of a thorough theoretical training, and enter upon their office work without any clear ideas of its nature or principles.

## ART AND INDUSTRY.

THE new School of Art which has been erected at Burslem on the site opposite to the Wedgwood Institute, given to the town by the late Mr. Thomas Hulme, was formally opened on the 10th inst. by the mayor of Burslem (Mr. S. Gibson) in the presence of a large company.

An address was delivered by Mr. E. R. Taylor, formerly head-master of the Birmingham Art School. In the course of it he said art had fluctuated during the ages, some periods showing more beautiful results than others, but for nearly a century—and this was for the first time in the world's history—ugliness had been dominant, though mercifully not universal. Some of them could remember almost the beginnings of this ugly period, previous to which not only the country was beautiful, but also every town and village, from its cathedral or village church, its manor-house, its streets and cottages, to their furnishings and the articles of everyday use. Now almost every town was ugly, and nearly every village was marred by rows of workmen's houses and suburban villas. It might be urged that the things they had ventured to call beautiful were so because they were old and had absorbed some of the beauty of their surroundings. Fortunately there was no need to condemn all new work, but would the ordinary suburban villas or the rows of workmen's houses grow beautiful as they grew old? What had brought about this deplorable change? It was easy to blame the use of steam and

machinery, but was it not rather their misuse? It was easy to ascribe it to the demand for cheapness, but this demand was as old as the hills, and ugly things were found amongst expensive as well as amongst cheap articles. Moreover, people could not buy them if they did not first make them, for in these things supply must precede demand in the first instance. Some would throw the blame on our national prosperity, but the prosperity of the reign of Queen Anne gave us those beautiful houses and other buildings, with their furnishings, many of which were still undestroyed in London, Edinburgh and other places, contrasting greatly with the ugliness resulting from the prosperity of the Victorian era. Others attributed it to the loss of craft power in the workman, but there still survived an unequalled inherited craft skill in Coventry, Birmingham and the Potteries, to go no further, but there were few to make wise use of it, and it was dying out or was driven to other countries. How many manufacturers, having made a competency out of what they had learned to see was inferior and ugly, had set themselves to lift the artistic quality of their work, if they thought that by so doing it would entail a risk to their profits? And were there not some firms of long standing, whose predecessors knew and made beautiful work, who were now living on the reputation of their ancestors, making inferior work of similar kind, adding nothing to the real wealth of the world, and growing nothing, though they might spasmodically import something from outside? It was even asserted that we were not an artistic nation. We admitted that this side of our nature had been so long repressed and lain dormant that some of its recent attempts at utterance had been wild and uncanny, as in the vagaries of the "New Art," though these had been wilder on the Continent than in England, thanks mainly to our art schools. But who built not only our cathedrals, but the smaller houses and workmen's cottages all over the country? They were built and furnished locally and were occupied by the workman and the labourer. We were beginning to cherish and learn from these, for their right and comely doing was in the air and was expected from everyone. "They builded better than they knew—unconscious stones to beauty grew." He ventured to mention one cause of this change—this loss of power of seeing and right doing. It should be remembered that the change began with the Victorian era, and yet just previously the first national efforts were made to spread education. An El Dorado seemed open in commerce. Ugly and vile surroundings, greater extremes of poverty and wealth and dull and vicious lives for both rich and poor became accepted as essentials in modern life, instead of being regarded as incidentals to an imperfect social state. This assumption, that life was only a struggle for material supremacy over nature and our fellow man, ruthlessly destroyed the beautiful in nature and art, and made the conditions of living often worse than those of the savage, whilst the methods of commerce had tended more and more to cheapness and ugliness, sweating and trusts, and, for the large majority, the shortening and narrowing of life. The success of men who had risen from poverty to riches, the advantages of the black coat of the manager, the clerk and the commercial traveller over the shirt-sleeves of the workmen were the inducements offered to parents and children, so that the latter might "take to learning," with the natural result of wrecked lives from over-stimulated ambition, a glut of clerks and professional men, and the degradation of the workman and craftsman; apprenticeship began to decline, being no longer honoured; workmen's lives became divorced from their work, as the ambition was to rise out of it instead of rising in it, and manufacturers too often became exploiters and merchants instead of co-workers. The present dominant and persistent cry of German and American competition, written about and uttered at public meetings, from universities downwards, was only the same note internationalised. In the desire to feed a great organism the individual organic units had been made to suffer, and this had reacted on the greater organism, making life and its environment ugly and vicious. It would have been entirely so but that this outside pressure had been resisted by the teachers, who had often at risk of loss given real training for living; but too often the hard mechanical power of intellect had had to be fed at the expense of both body and feeling. The speaker quoted Herbert Spencer upon the stress of modern life and competition, and asked what was to be the end of this competition, which was largely a competition in cheapness and ugliness. They were trying to make a turn, and were beginning to realise

that literature and art were not unprofitable things in even to their occupations. Emphasising the importance of art training, he quoted also Bacon, who was near the mark when he wrote—"The education of the senses needs all after education partakes of a drowsiness and indolence it is impossible to cure." Tring, who said much for drawing as an essential in education, said:—"It is a great loss that the grand power of drawing has never found its place as a teaching power." Outside the art world the strongest plea for the development of the art faculty was the experience of a great scientist, Darwin, who, after the loss of it, his mind having become "a kind of machine for grinding general laws out of a large collection of facts." This faculty had been paralysed, dissolved, and in many cases killed because all the time given to education had been occupied in developing the other faculties. Darwin, using the word in its widest sense, was the surest and shortest way of developing this faculty, which opened windows of the soul not only to the facts of nature but to its beauties—"the mantle of an invisible God"—and to the work of that lesser creation, man; which taught us to make the best use of the work and life nearest us, of striving at all costs—physical, mental and moral—to become wealthy and dominant, which cultivated the strength which ennobled life and the work for daily use was in constant exercise, visually or by memory; was more than merely mental, though developed by mental exercises; was not primarily ethical, but was at least so far ethical that it gave an unselfish present life, increasing the more it was shared; stimulated sympathy, reverence, joy, admiration, and was the most fruitful of all pleasures; made literature many fold what it possibly be to those who had it not, and wove the pattern of life and toil into a beautiful pattern, invisible to those who merely possessed that microscopic vision which sees only so many threads and spent itself in adding to the number. They were becoming alive to its value in the industries. It was also of value in teaching other subjects, but there was just now a danger of its growth being spoiled by having to do this year's service. But he did want them to demand that art should be made an essential in education, co-equal—and co-equal in point of time—with those subjects now recognised as essentials, from the infant school (in which much work had already been done) to the university, instead of being partially admitted on sufferance, and the demand be made as an inherent right of every child. Its methods were doing, thinking, learning, not learning, thinking, doing. There was not a long drudgery; these could begin as was the case with many subjects, for our greatest teacher had said that he had not met a child who could not learn to draw. Ruskin said:—"Great men should write their autobiographies in three MSS.—the first their deeds, the book of their words and the book of their thoughts. Not one of these books can be understood unless one read the two others; but of the three the only one that is trustworthy is the last. The acts of a nation are made triumphant by its good fortune and its words made wise by the genius of a few of its children; but its art only shows its general gifts and common sympathies of the people." Speaking more especially to the students present, he said theirs was the emotional study of nature and art, and they should remember that though beauty defied analysis, it was not unhesitating canons of beauty. Technical power was often developed beyond the inner perception of beauty. This was our curse to-day. How little technical skill was seen in much beautiful Oriental work. He advised students to study to find the kinships in the styles of past art rather than differences; to study most the growing periods of styles rather than the fully ripe or decadent. Let them not be disheartened if at times they appeared not to be making progress, but remember that genius had the same struggles as themselves. Their work should be accurate, expressive, delicate, the expression of joyous vision, as in the best expressions of music and literature. Tradition should be subordinated to materials, use, personality and nature. Do not urge the value of still-life painting and recommend many short-time studies, a few lines only. All right drawing was memory drawing; it was thinking about what was seen and it added to knowledge. When they had been able to feel a sense of the beautiful the vision would in part be fixed and to this they could give expression when the beautiful object was away, but much of memory work was done in the memory of words of which the true meaning was not known. Let it only follow earnest direct study or direct development of mannerisms and emptiness, killing receptivity.

al drawing was also design. Both for composition design for manufacturers, line drawings of landscape and good architecture were excellent studies. Let them or solid geometry so as to read plans, elevations and ns. It was a universal language and was the entrance alike to art and to many sciences.

## SHEFFIELD SOCIETY OF ARCHITECTS.

The opening meeting of the session in connection with the Sheffield Society of Architects and Surveyors was on the 10th inst. in the Sheffield University, when the presidential address by Mr. W. C. Fenton, F.R.I.B.A., was

The President opened with a reference to the formation of the Sheffield Society twenty years ago, and reviewed its progress to the present time. They had now a membership of 1, being a net increase of forty-three on the year. In 1887 the architects and surveyors of Sheffield were to a great extent isolated units, looking upon one another with suspicion, he said, and if the Society had done nothing it had succeeded in bringing about a friendly feeling between members of the profession. It had also enabled them to speak with a united voice on all matters affecting the interests and that of the building public generally. The Society had also been the means of giving the profession a standing and influence in the city which it never possessed before. The municipal authorities had recognised its position, and had consulted them on many occasions in matters of interest to the citizens.

In speaking of the work the Society had done for the education of the younger members, Mr. Fenton specially referred to the inaugural work of Mr. E. M. Gibbs in connection with their classes, and the interest he had shown in the Board of Architectural Education and the university. He had been untiring in his efforts to bring about a formalised course of architectural education to be carried out by the university in conjunction with their Society. At night they met on the eve of the first session in the department of architecture. The master and lecturer had been recommended for appointment, and it only remained to give the youth of the city and their parents to take advantage of the opportunities offered in the university. As far back as February 1903 the building committee of the university had decided to allot a room to them, but they had only entered occupation that night. He sincerely hoped the innovation would be utilised to the fullest extent, and that the efforts of Mr. Gibbs and his co-workers would be crowned with the success they merited.

Referring to the proposed new city by-laws as to streets and buildings, the President said they did not yet know what was being done relative to the practical objections against these by-laws which had been put forward on behalf of the Society. But there appeared to be a distinct tendency on the part of the authorities to draw the reins tighter and tighter, and thus increase the cost of building to an extent which would have a prejudicial effect upon the building public. In view of the agitation in the country for better housing of the working classes at reasonable rents, it was important to note that the proposed by-laws would have the effect of increasing the cost of cottage houses by 10 per cent., a result which he was sure would not be received with equanimity by housing reformers. Taking into consideration also the proposal to limit the number of houses to the acre, the outlook for the erection of houses of that class at anything like a reasonable rent was not at all bright.

The speaker emphasised that Councillor Tom Shaw, in his report to the estates committee on the proceedings of the recent International Housing Committee, had urged that the need had been proved for more elasticity in the application of by-laws with respect to new streets and buildings. In the proposed new by-laws, however, no attempt appeared to be made to meet objections which had been raised from time to time as to harassing details and like, and which the Congress had pointed out as unnecessary. If important modifications were not made in the proposed by-laws in several important directions, then Sheffield could not expect much further success in the solution of the housing question excepting at great cost to the ratepayers. But he hoped wiser counsels would prevail, and that, instead of fixing a maximum quality of construction and work, a minimum would be fixed to prevent jerry-building, and not penalise the man who did the work. Their

Society did not represent the property owners, but viewed the matter purely from the point of view of good materials and construction and the benefit of the whole community. They were anxious at all times to work amicably with the Corporation authorities, and if the "sweet spirit of reasonableness" were exercised on both sides many difficulties would vanish which now caused considerable worry and useless irritation.

Though the Corporation were understood to be advised that houses at 5s. per week could not be erected without loss, Mr. Fenton went on, in dealing with another phase of the housing problem, the result of a recent competition had shown that such a scheme could be successfully carried out. The duty of the Corporation was certainly greatest toward the lower-paid artisan, who was less able to look after himself in the provision of a house at reasonable rent. But as to whether the Corporation should go in for an extensive scheme of building houses or whether that should be left to private enterprise, all he could say was that if private enterprise would produce good, comfortable and sanitary houses under reasonable regulations and proper supervision, there was no need for the Corporation to take over that class of work as part of their trading concerns. What good work had been done in that direction would no doubt prove an incentive to private enterprise, and the housing exhibition at Wincobank gave examples to meet a variety of tastes.

On the subject of town planning the President made an ironical reference to the more or less distinguished amateurs who were going to undo all the evils of the past and "make the desert bloom as the rose." The fact could not be denied that in the past there had been far too little method in laying out towns, but some of the most interesting and picturesque cities in England and on the Continent would never have existed had some of their amateur town planners had their way. A committee of the Association of Municipal Corporations had reported that over 13,000,000l. had been spent in street improvements and the provision of open spaces during the last thirty years which might have been saved if local authorities had exercised foresight in the development of their districts. It was anticipated that at least that sum would be saved during the next thirty years if town planning powers were granted by Act of Parliament and wisely administered by local authorities.

On the motion of Mr. W. J. Hale, seconded by Mr. E. M. Gibbs and supported by Messrs. H. L. Paterson, J. Smith, J. R. Wigfull (hon. secretary), A. F. Watson and W. G. Buck, the President was accorded a vote of thanks for his address.

## EARTHQUAKE AND FIREPROOF BUILDINGS.

THE British Consul, Frederick van Dyne, of Kingston, reports that, profiting by the experience in the earthquake and fire in that Jamaican city in January last, the new building law provides that in future, so far as possible, earthquake-proof and fire-resisting buildings only shall be erected. Some of the requirements are as follows:—The framework of buildings may be of steel, iron or wood, every member securely, rigidly and durably connected with every contiguous member, and must be covered externally with hard, durable and fire-resisting material, securely attached to the framing at all points. No timber-framed building shall contain more than two storeys having an aggregate height of 25 feet, or have a cubical content exceeding 100,000 cubic feet, nor shall any timber-framed building be erected or used for any other than residential purposes. All members of a steel or iron framework of any building shall be of the same material, and no cast-iron shall be used in any part thereof. The walls of buildings may be constructed of brick, concrete, stone or other hard and incombustible material, and they must be built on a foundation of cement concrete. Walls built of brick, dressed stone or other similar material must be solidly put together with Portland cement mortar, and be reinforced by hoop or band-iron not less than one inch wide and one-twentieth of an inch thick. Walls of cement concrete shall be composed of Portland cement, clean sand and clean broken brick or stone, and shall be reinforced by steel or iron bands, bars or wires. Roofs must be covered externally with hard, durable and incombustible material. Iron and steel framing specially manufactured for the construction of buildings and Portland cement are exempted from duty until April 1, 1909.

## NOTES AND COMMENTS.

At the meeting of the West Sussex education committee last week it was recommended that the architect, Mr. HAYDN P. ROBERTS, be paid a salary of 200*l.* per annum, rising to 300*l.* by annual increments of 20*l.*, to date from October 1, 1907, and that an assistant to the architect be advertised for, that he be paid a salary of 100*l.* per annum, and that a sub-committee be appointed to consider the applications and to select candidates for the post, and that as a matter of urgency the building sub-committee be allowed to make the appointment at their next meeting. Some of the members objected that the terms were too liberal, and that it would be better to pay a salary of 200*l.*, with an increase of 20*l.*, for the first year, leaving any subsequent increase for reconsideration. There was, it is said, an enormous competition for such positions, and if there was a vacancy there would probably be 300 applicants. The Dean of CHICHESTER maintained that as a county body they could not do less than pay their architect a living wage, and not go in for sweating that profession on account of the large number of unemployed members there were in it. A majority of the members was opposed to the recommendation, which would enable the committee to be sure of the services of their present architect who had carried out his work in a most efficient and economical manner. It was also resolved that the salary of the assistant to the architect should at first be 80*l.* instead of 100*l.* The abundant supply in the market cannot be ignored, and the West Sussex education committee have taken advantage of it. They were fortunate in obtaining a few years ago an architect at a salary of 120*l.* a year, and some of the members believe that many other able architects would gladly accept a similar salary.

M. RODIN, the sculptor, had arranged to exhibit about 300 of his drawings from the nude at the Autumn Salon, but they are now to be seen in one of the dealers' galleries. It is a peculiarity of them that they show instantaneous movements with as much fidelity as if the outlines were due to some photographic process. The models were not posed in the ordinary way, but were allowed to move as they pleased, and the sculptor with his pencil and a water-colour wash endeavoured to record the changes. They are, consequently, likely to be useful to a sculptor who represents movement, and they are also evidence of the skill with which M. RODIN can show changes from moment to moment. They have consequently some analogy to the studies which the late PAUL BAUDRY prepared, and in which several outlines of the same figure appear as if they were corrections of the original contours, but which were intended to recall to him slight changes of pose in the figure or the appearances presented by a slight shifting of the point of view. When BAUDRY allowed his drawings to be reproduced, it was in the expectation that they would be serviceable to artists. Painters and sculptors, rather than amateurs, are likely to understand and appreciate M. RODIN's studies.

Mr. WILLIAM CALLOW, a selection from whose drawings can now be seen at the Leicester Galleries, was born in 1812, and may be regarded as the NESTOR of water-colour artists. In his youth he was taught in Paris, and became teacher of drawing in the family of LOUIS PHILIPPE. In those days he was likely to be acquainted with LOUIS GRATIA, the pastellist, who was born in 1815, and ERNEST HÉBERT, who was born in 1817, and was afterwards director of the French Academy in Rome. M. GRATIA is a candidate for the occupation of the country house at Montlignon which Madame JULES COMTE has made over to the Society of French Artists. He first exhibited in 1837 with three pastels, and at the present time he still successfully

practises that branch of art. Madame COMTE had had erected near the mansion several ateliers for painting in which the residents can follow their art under favourable conditions.

## ILLUSTRATIONS.

CHURCH OF ST. ALBAN, BOURNEMOUTH.

THE foundation-stone of the above-named church was laid on October 8 by the Lord Bishop of SOUTHAMPTON. The church will be built upon a site, with a considerable fall from west to east, and the architect has taken advantage of this, and has placed large crypt vestries under the chancel and chapel, connecting same with the church by a broad flight of steps. The plan of the church consists of a nave 93 feet 6 inches in length and 30 feet 6 inches in width, adjoining north and south transepts, that on the north side having accommodation for eighty-four adults, and on the south side for seventy-eight adults, and having an archway opening into the passage and staircase leading to the vestries, and a large archway opening into the organ chamber, having ample space for a large organ front facing towards the chancel and part facing towards the west. A musician's gallery is placed on the north side of the chancel. A lofty arch carried to nearly the height of the roof divides the nave from the chancel. The chancel is 38 feet 6 inches in length by 27 feet 6 inches in width, and convenient passages for returning communicants are placed on either side. The nave is designed to have five bays, with an archway opening at the west end opening into a baptistery, having an entrance porchway on either side. The side walls of the nave rise to a height of 27 feet, and the apex of the roof is 45 feet from the floor. The roof runs at a level throughout the nave and chancel and is of the or wagon form. One of the chief features of the church will be the tower and copper-covered spire rising to a height of 160 feet from the ground, placed at the north side of the church at the west end of the transept, the base of the tower forming the principal entrance to the church. The church is designed to accommodate about 700 adults, and the present contract consists of the chancel, vestries, transepts, chapel and two bays of the nave, the cost for which is 7,435*l.* The materials to be used in the erection of the church are Purbeck stone for the exterior walling and red and yellow brick facings internally with Bath stone dressings. The builders are Messrs. BOWMAN & SONS, of Stamford, and the architect is Mr. GEO. H. FELLOWES PRYNNE, F.R.I.B.A., of 6, Anne's Gate, Westminster, S.W.

CONVALESCENT HOME, HIGH BEECH, EPPING FOREST.

SUNDERLAND LIBRARY COMPETITION.—FIRST AND SECOND PREMIATED DESIGNS.

WE publish in this issue the designs placed first and second in the competition for the new library to be erected in Villette Road, Sunderland. It will be remembered that the architects, Messrs. I. CRATNEY & SONS, of Sunderland and Wallsend, secured a unique record by securing the second premium as well as being placed first for the two local libraries published the designs which were placed first and second for the Church Street Library in our issue of August 9, 1907. The library committee have selected the second premiated design in each case, and have adopted the suggestion made by the architects that the elevation to Villette Mount be made the same as the elevation to Villette Road, thus securing a symmetrical exterior. The whole of the drawings are by Mr. I. CRATNEY. Tenders are about to be obtained.

CATHEDRAL SERIES.—SOUTHWARK: THE NAVE, LOOKING EAST.

## ENGLISH MEDIAEVAL ARCHITECTURE.

introductory lecture to the course on "English Mediaeval Architecture," which will be delivered by S. Prior, F.S.A., in University College, London, was on Friday last. Mr. Prior said English Mediaeval architecture loomed before us, at first vast and magnificent, we came up to it we were able to note its external and to analyse its intricacy, as well as the many of interest uniting the opening perspectives, the of detail and the dizzy heights it had attained. But were all external features, and as such they had been and collated. Research and investigation had in some instances the details had been taken horizontally, and in others the points had been treated vertically afterwards the changes were arranged into periods. had traced the developments from the foundation All that was very good and satisfactory, all at as knowledge, but it was concerned only, as already with externals, and was outside the great mass of architecture. There was no opening by which they see what was the purpose of all that vast intricacy in work, and they could not, therefore, get inside, ere, of the art. But they could, so to speak, raise lves to the windows of some of the buildings and ps and limited views of the conditions. Thus it at the different phases and aspects of Mediaeval ture had been recorded. The lecturer said he d taking them to one of those windows and ur to show the relations which existed between ction and style and how out of construction grew By the aid of a chart which was exhibited Mr. Prior he advance of Mediaeval architecture horizontally tically. One side of the chart were the centuries, her the details, a third section gave the outlines by periods of Mediaeval architecture were distinguished. ost prominent events were enumerated. The first conversion. Mediaeval architecture was a Christian ture, and in its primary phase came the conversion er modes of building. A period of 466 years elapsed, r, before the Conquest, i.e. the Norman Conquest. a sense made the greatest change which ever took e course of architectural history in any country. Conquest brought Mediaeval building into the general ture of Europe, and the lecturer said he would to show that it did not make it Norman but e course of English art into the general course opean art. Then 142 years went by, and the age was reached. This made a certain point in ry of English Mediaeval architecture, and the change t, instead of its being a part of the architecture of urope, it began to take a line of its own. It became use insular, and that was brought about by the al events of the time. A further 141 years elapsed y came to the next important event, the Black Death. exceedingly fatal in England, and the effect on ture was very extraordinary. It brought to an end progress that had been going on up to that time. o years passed by and they came to the Dissolution. as the last event it was necessary to notice in the of English Mediaeval architecture. It practically put o church building. Another aspect of the subject by the lecturer was the connection between the of other countries with English art, and finally he tion to the personal atmosphere—the influence of ole who were chiefly responsible for all that archi- as well as the conditions which affected the arts first way and then in another. The points were sum- as construction, style, action and the personal . At the outset of his course of lectures Mr. Prior thought it would be well to give some definition of is used. Construction, he said, required no explana- architectural students, but style was a somewhat us term. The relation between style and construc- ally took them into the most intricate parts of architecture. The style of Mediaeval work was a idea, and could be compared to a composite aph of many elements. In this way the style a catalogue of external features and could be ed with construction. Style could be taken as ary of architecture. They could speak of con- as the life of architecture and style as its . Style, however, could be a cloak upon natural ction, and, like a cloak, could be stuffed and padded. could misrepresent construction. Styles might not tter from one another in forms, but also in the in which they clothed various facts. The art of the

Middle Ages rose chiefly and directly through its science. They therefore spoke of the proof of Gothic, and it was that characteristic which gave value to the study of Gothic by architectural students. A finished building was still the test of good architecture. The lecturer said he believed that the study of a Mediaeval work was the best primer for the young architect. In the course of the lectures he was about to deliver Gothic and Romanesque would be considered as one style. In both there was always the same movement and the same way of expressing construction, and he would endeavour to explain the continuous advance of Mediaeval art by establishing one central idea and a series of secondary ones.

Lieut.-Col. A. C. Preston (master of the Carpenters' Company), who presided at the meeting, proposed a vote of thanks to the lecturer.

The Provost said he wished before they dispersed, on behalf of the authorities of the University, to express the deep debt of gratitude that they owed to the Carpenters' Company for the assistance they gave the University in carrying on the work of the architectural department. But for that assistance the special evening course would have been impossible. The evening courses which were instituted in the University some fifty years ago were the pioneers in technical education, and so was the new series they were undertaking. There was nothing like it elsewhere. They had given up the lighter work, which was now being done satisfactorily at the polytechnics and other institutions, and they were introducing the higher continuation in architectural work. In conclusion, he expressed the thanks of the University to the Master of Carpenters' Company for presiding at the meeting.

Professor F. M. Simpson seconded the vote of thanks. Of all the great City companies who supported by their funds the advancement of the crafts for which they were originally instituted, he thought the Carpenters' Company stood first. In the liberal support it had for many years given to the architectural class in University College, to the way in which it ran the Crafts School in Great Titchfield Street, and in many other ways it continued to do very much the same work as it did originally. And it was also the members they had to thank for the interest they took individually in such work, and this was exemplified by the presence of the master there that evening.

Lieut.-Col. Preston briefly replied, and said the Carpenters' Company endeavoured to do the best they could with the funds at their disposal, both with regard to technical education and purposes of charity.

## LIVERPOOL ARCHITECTURAL SOCIETY.

ON Monday evening Mr. Edmund Kirby, president delivered the sessional inaugural address to the members of the Liverpool Architectural Society, whose diamond jubilee is about to be celebrated. There was a large attendance. In the course of his address Mr. Kirby said:—The public works on the George's Dock have been completed or passed for erection. In my opinion, this is one of the best improvements on the George's Dock estate. It emphasises the crying want of continuations of improvements of the Pierhead further along the river front to the north. The faded white brick wall should be speedily removed and replaced by stone arcades and colonnades, with waiting-rooms, &c., placed at right angles. Nor should the improvement stop opposite the George's Dock. The south end of the Prince's Pier ought to be similarly treated. And to make the architectural effect of the river frontage continuous and the connection of the George's and Prince's piers complete, I would suggest the erection over the present floating bridge of a covered way in the form of a beautiful permanent bridge of stone, forming an arch of peace as a centre to what might be conceived as a beautiful and noble gateway to the city. Then the central site be devoted to the amusement and convenience of the public by the erection of a combination of one-storey buildings comprising a café and restaurant on a grand scale where all classes could be regaled in a style equal to the best Swiss railway buffets; a hall or lounge for music and a winter garden. This would complete a haven of rest and of pleasure—a picture of the true socialism in a real people's palace. In another portion of his speech Mr. Kirby said it was necessary for the city to obtain control of the speculator and prevent the indefinite and unguided growth of its suburbs. Having emphasised the fact that Berlin has no slums and no slum-like population, Mr. Kirby

suggested that if the Lord Mayor-designate (Dr. Caton, chairman of the housing committee) would take the city Council, magistrates and other leading citizens in procession through the slums, these insanitary areas would soon be swept away. In conclusion, he expressed a high appreciation of the pioneer action of the University of Liverpool in instituting the degree of Bachelor of Architecture and of the value of the School of Architecture.

On the motion of Mr. Thicknesse, seconded by Mr. Huon A. Matear, thanks were cordially tendered to Mr. Kirby.

### THE SOCIETY OF ARCHITECTS.

THE twenty-third annual report of the Council states that fifty-four new members and seventy-one new students have been elected. One member has been reinstated and two transferred to the "retired" list, so that, after allowing for deaths, removals and resignations, the total membership stands at 844, an increase of sixty-eight over last year. A question which has received consideration is the advisability of closing the membership after a given time to all except those who qualify by examination, but the Council felt that the time was not yet ripe for such a step.

The first year's working under the revised articles of association has shown that while a great deal more work has been thrown upon the members of the Council in regard to interim committee meetings, the business of the Society has been greatly facilitated, and it is clear that it would have been impossible to properly cope with the work under the old conditions. As regards details affecting the members several have taken advantage of the "retiring" clause, and the Society thereby still retains their personal support which it would otherwise have lost. No foreign member has as yet compounded for his subscription, though it was at the request of these members that the alteration in this respect was made.

The result of placing the students upon a definite footing and giving them certain powers in their own section has resulted in various schemes being brought forward, all tending to the development of the Society.

The half-yearly examinations have been held as in previous years in Manchester and London, and arrangements have been made for centres in Johannesburg, Pietermaritzburg and Cape Town, under the auspices of the South African branch of the Society. The examination syllabus has been revised, particularly in regard to the facilities afforded to students of the Society, who are now able if they wish to take the examination by sections, and to secure in connection therewith sectional certificates exchangeable in due course for the full membership certificate. Another innovation in the syllabus is that the subject for design is to be taken on the last day and announced on the first, so as to give candidates more time for consideration of the problem set.

The students' committee met early in the session and appointed Mr. C. H. Mead (member of Council) as its chairman. A form of "return" was afterwards sent to every student with a view of eliciting opinions as to the best method of developing this section, with the result that a suggestion was made to the Council for the organisation of correspondence classes leading up to the Society's examination.

This was approved in principle and referred to the examination committee on points of detail, and a scheme was brought forward for a three years' course and adopted, subject to sufficient support being forthcoming from the students, the examiners appointed being the chairman of committee, Mr. C. H. Mead, and Mr. J. Bartlett, a member of the board of examiners. The first year's course has already commenced.

The Travelling Studentship Competition attracted twenty-six competitors, the subject set being a church to cost not exceeding 5,000*l.* The winner was Mr. J. Drummond Murdoch, of Edinburgh. The president (Mr. Albert E. Pridmore) again gave a special prize of the value of 3*l.* 3*s.*, which went to Mr. Hubert Savage, of Muswell Hill, N. Mr. Edgar M. Leest, J.P. (member of Council), offered a prize of the value of 3*l.* 3*s.* for a design for a bungalow to be built at a cost of 500*l.* The notice given for this competition was necessarily somewhat short, but there were twelve entries, and the prize was awarded to Mr. C. H. Hudson, of Islington, a second prize of the value of 1*l.* 1*s.* being awarded by the Council to Mr. H. W. Smith, of Oxford. The designs were subse-

quently on view at the Society's premises, and were exhibited at the Guildhall, Devonport, through the efforts of Mr. Leest, when nearly one thousand persons during the two days when the drawings were on view. The Mayor and other prominent townsmen took part in promoting the success of the exhibition.

The competitive examination for the Archibald Scholarship 1907, of the value of 10*l.* per annum, for three years, was held in May in London, Liverpool, and Shrewsbury, the winner being Mr. G. M. Maddox (a pupil of Mr. G. Dickens-Lewis of that town).

Books in considerable number have been added to the library by gift and purchase, and upwards of 330 have been issued from the loan collection during the year. The Society's collection of lantern slides has been augmented by members and has several times been used for lectures, &c.

The register has proved a useful medium in a number of cases for the filling of vacancies, but the number of assistants is greatly in excess of the demand, and always suitable candidates wanting places. The Council would confer a practical favour upon students and the public by notifying the secretary at once of any vacancy in the office.

Early in the session the attention of the Council was called to the action of the Incorporated Association of Municipal and County Engineers in circularising local authorities throughout the kingdom, asking them to support the Registration Bill on the grounds that clauses (28) was intended to deprive local authorities of the advice and assistance of their officers on matters connected with buildings and building plans, and that it would increase the expenses of administration and produce complications without any corresponding advantage.

The Council thereupon addressed a letter to the local authorities with the object of showing the true position of the clause in question, asking them to suspend pending a conference between representatives of the Association and of the Engineers. The matter is now under consideration by the parties concerned and the Council endeavours to meet the views of its opponents. It can be done without sacrificing the principle of the Bill. In the meantime the Bill is in the hands of Mr. Atherley Jones, K.C., M.P., who has undertaken to support it at the first favourable opportunity. Other opponents of the Bill came from the Institution of Civil Engineers, Ireland, who circularised their members on the grounds that it was detrimental to their interests. The reason, however, for the opposition of the Engineers is not that neither section of the community represents the professional bodies referred to were scheduled in the Bill as being permitted to carry out such architectural work as comes within their province, as is the case with the Institution of Civil Engineers and the Surveyors' Society. The Council, while giving every consideration to the objections made to it by interested parties in regard to the Bill, is not in any way relaxing its efforts to secure its progress through Parliament, but is using everything in its power to bring about the passage of the Bill. The Council followed up its circular to the local authorities by writing to those who had been asked to support the Bill, which a number of them undertook to do, and to others who had previously pledged themselves for the ballot offered their support in other ways. Various social gatherings of the Society at which members of Parliament were present have been made the occasion of enlisting their sympathies with excellent results. The Council is informed that the measure is everywhere more sympathetic treatment than before at the hands of members of Parliament.

Among various points considered by the Council in connection with the proposed amendment of the Building Act was the procedure adopted by the County Council when giving its approval to plans for means of escape in case of fire, requiring details of all balconies and outside ironwork to be submitted for approval under Part VII. of the Act. In the opinion of the Council these staircases are not temporary buildings or structures, and therefore do not come under Part VII. of the Act, but should be dealt with by the district surveyor under Part I. of the Act. The point is an important one for the architectural profession, in view of the additional work involved without adequate remuneration, and equally important to the public as ratepayers in view of the large

London County Council must employ to deal with these exhibitions, at a cost which would not be covered by the fees received. A resolution embodying the Council's views has been submitted to the London County Council and the matter has been referred to the committee dealing with the subject. It is hoped that in due course the London County Council will see its way to give effect to the Society's suggestion.

The Council urged upon the London County Council the expediency of altering the scale of the plans to be prepared to 1/16 to 1/32 feet to 1 inch, for convenience both as regards draughtsmanship and subsequent handling. It was suggested, however, that such an alteration could not conveniently be made.

Although not strictly a matter in which the Council, as a body, is concerned, it has pleasure in recording the fact that, on the initiative taken by the President and the Secretary some months ago, a meeting of masons connected with the Society was called, with the result that an application was made for a warrant for a lodge to be called "The Masons of Architects' Lodge," the president (Mr. Albert E. Poynter) being unanimously nominated as the first Master. The application was approved and the warrant granted, and the lodge was duly consecrated on October 16 at the Great Eastern Hotel by the grand secretary (Sir Edward Letcher) and other grand officers. The Society of Architects' Lodge No. 3244, is the first Masonic lodge identified by the architectural profession or with any architectural institution.

## INTERNATIONAL EXHIBITIONS AND ART.

THE witnesses who gave evidence before the International Exhibitions Committee was one of the members, Sir Isidore Spielmann. In the course of the evidence he said:—

Chairman: What have you to say as to art as a centre of attraction at international exhibitions?—Art is invariably regarded as one of the most attractive features at an international exhibition. There can be little question of the educational importance to students of art as a means of comparison, to say nothing of its great interest to the general public. Other countries eagerly participate in the art section at international exhibitions, and Great Britain cannot well afford to abstain. International exhibitions are international competitions, and the success of any country, in art or in any other section, reflects its prestige in the public estimation. Moreover, the names of artists who elect to be represented are kept before the public while those who are not to be found in the catalogue are likely to be forgotten.

Chairman: Have you to say about the past and present methods of exhibiting art sections?—The art section is always a "live exhibit." At the earlier international exhibitions the art section contained works that were mostly loaned from private owners, and were termed "loan exhibitions." These sections were, as a rule, good in themselves, but were not representative of British art of the time. Commencing with the Brussels Exhibition of 1897, and since then, the tendency has been to make the British art section representative of the art of the time. In recent years very searching selections are made not only of the works to be represented, but also of the works they send, so that the British school in its various branches may be shown at its best, and by the most representative art that can possibly be procured.

Chairman: You mean that there has been a limit of time laid down and that you would not allow us to send early pictures as a rule?—As a rule the limit is laid down at ten years. I am of opinion that if contests of nations are entered upon the fact should be faced that it is our manifest duty that we should rigidly and fearlessly exercise our power of selecting works for exhibition, and not be invidious and distasteful that task may be; and that the arrangement of the works in the section, more especially if the space be limited, should be displayed on a basis of merit, free of any influence of fear or favour, to the very best advantage, in view of our success in the competition. Unless we are prepared to act up to this standard I think all competition will be declined as likely to lead to disappointment, if not to humiliation, from a national standpoint.

Chairman: Do you say as regards the space which has been allotted to Great Britain?—The space allotted to Great Britain for art at the last four international exhibitions may be described in the following manner:—At the Brussels Exhibition, 1897, well situated but insufficient; at the Paris

Exhibition, 1900, well situated but insufficient; and at the St. Louis Exhibition, 1904, it was very badly situated and very insufficient.

Why was that?—Because Germany and France had been there in advance, and had secured the best positions and an amount of space quite disproportionate to ours. At the New Zealand Exhibition, 1906-7, the art section was well situated and sufficient. I would like now to refer to passages in the two reports on the Paris Exhibition and the St. Louis Exhibition which bear on this subject, which really is the most important point in my evidence.

You mean as to your not getting space enough?—Yes. Sir Edward Poynter in his report on the art section to the Royal Commission for the Paris Exhibition said:—"To Great Britain, in the section devoted to painting, drawing, engraving and architecture, there were allotted 475 lineal feet, as against 900 feet to Russia, 880 feet to Germany, 780 feet to Italy, 600 feet to Belgium, 580 feet to Spain, 490 feet to Switzerland and 400 feet to Portugal.

Mr. Wilson Fox: That was probably because we came in last?—Yes.

Was it not, in fact, our own fault?—No.

It was not the fault so much of the people who allotted it as it was our fault in only turning up when there was no cake left to eat?—We must also remember that at many of these exhibitions they do apportion the space originally to certain countries, and only have to await the reply of the various countries to the invitations issued.

Mr. Algernon Law: Perhaps, too, we required more space in other sections?—No, this refers to the art section at the Paris Exhibition, and I am only dealing with that section, of course.

But may not the explanation also be that the space we required in other parts of the exhibition was so great that to compensate the other countries they gave them more for art than they did to us?—I do not think so.

Chairman: Do you think we were unfairly treated?—I do, and I want to show how it worked out.

Mr. Malcolm Ramsay: That statement which you have just read to us is Sir Edward Poynter's, is it not?—It is signed by the Duke of Argyll and Sir Edward Poynter, the president and chairman of the art section. In the end, after a great deal of trouble, we succeeded in getting 783 lineal feet, equal to about 22 square feet per exhibitor. In comparison with the 22 square feet per exhibitor in the British section, France had 45 square feet, Austria 24 square feet, Belgium 51 square feet, Denmark 30 square feet, Germany 27 square feet, Holland 31 square feet, Italy 52 square feet, Russia 49 square feet, Spain 57 square feet and Switzerland 31 square feet. So there you see we were very low down as regards the amount of square feet per exhibitor.

Mr. Harris: May not that have been due partly to a lingering illusion that the British have no art worth exhibiting?—I do not think so, coming after the Brussels Exhibition of 1897.

Do you not think that perhaps that lesson had not been sufficiently learnt?—They knew perfectly well that if we participated we should make a very strong display.

You think they did know that?—Yes.

Mr. Malcolm Ramsay: Are the square feet per exhibitor a very trustworthy test?—I think so.

In this particular case did you have to refuse a large number of exhibitors in consequence of not getting the space?—No. What we had to do was to hang our works very high, and the whole of the effect of the section had to suffer in consequence.

Mr. Malcolm Ramsay: You had it crowded more or less, and on the sky line?—Yes, we had it crowded. Then as regards the St. Louis Exhibition, not only was the space inadequate but it was very badly situated.

Mr. Algernon Law: Was any remonstrance made?—Yes. "A strong effort was made by the chairman to secure two additional rooms, but with only partial success, although it was understood that these had originally been promised to us."

Chairman: Was that on account of the lateness of the application?—I should say so, partly. We might have had space situated in a very much better position in the fine art section in Paris if we had made earlier application; still, they must have known perfectly well that Great Britain would participate.

The lesson that you would draw is, I take it, that we must apply earlier?—Yes.

What is the course taken in the selection of the artist exhibitors and works?—The usual course is to invite the most eminent artists from very carefully prepared lists to

participate. Special works also are invited from the very best that have been produced during the previous ten years, irrespective of the standing of the artist.—works in oil, water-colour, sculpture, architecture and in black and white. The ten years' limit is usually a regulation of the exhibition. This system of selecting special works, though excellent in theory, is very difficult to work in practice. It is invariably determined that no art society should be invited to exhibit as a body, but that all works should be invited as the work of individuals, and not as representing any institution.

What is your method of obtaining works of art from owners and artists?—The success of an art section largely depends upon the willingness of private owners and of artists to place their works at the disposal of the art committee. It is becoming increasingly difficult to borrow works from private owners, especially for exhibitions at a great distance from England. This is partly owing to the frequency with which these exhibitions occur. In 1897 but little difficulty was found in borrowing such works, but it has since then become more and more difficult.

Next, I think you want to deal with the collecting, packing and transport of the art exhibits?—Yes. Art exhibits have to be collected from all parts of the country, and it is at this stage that injury to them sometimes occurs. When received in London they are packed by fine-art packers in zinc-lined cases and forwarded from London to the art gallery at the exhibition, each consignment being in charge of a special officer. At the termination of the exhibition repacking and redistributing the works and winding up generally occupy a considerable time. In the event of awards being given, their receipt and their distribution still further delay winding up. The decoration of the section, as well as its installation, the preparation of the catalogue and the sales of works on behalf of artists are undertaken by the country participating.

I suppose you have to pay the customs duty when they are sold, in America, say?—Yes. The exhibition being regarded as a bonded warehouse, things sold pay the duty as they leave the exhibition. It is usual that the buyer pays the duty; it has nothing to do with the seller.

Insurance is a considerable item in the cost, is it not?—Yes. Insurance for a very large sum has to be effected at an early stage, and before the insurance market is adversely affected, and this is one of the largest items of expenditure in the cost of the art section. The art exhibits are insured against all risks—fire, marine, theft, damage or total loss; and this is invariably done free of costs to private owners and artists. We always find it very difficult to insure our sculpture exhibits, as the premium is very high; and as regards works in plaster, we do not send them unless we send them at the sculptor's own risk.

Because they are damaged so easily?—Yes. As a rule very little damage occurs, the chief claims upon the insurance companies being for broken picture glasses and damaged frames.

Can you give us the ordinary picture premium and sculpture premium?—On the works sent to the Brussels Exhibition we commenced at 17s. 6d. per cent., and we went up to about 20s. per cent.

Mr. Wilson Fox: Would that cover every risk?—Yes. For the Paris Exhibition we commenced at 20s. per cent., for St. Louis we commenced at 30s. per cent., and before we had finished the premium had gone up to very nearly 50s. per cent. owing to the very large amount that was being covered at Lloyd's by other exhibitors. On bronzes we had to pay 3l. 3s. per cent., and on marble about 5l. 5s. per cent.

Mr. Algernon Law: Did you insure each individual picture?—Yes.

Then you do not insure *en bloc* in the sort of way that Cook's, the tourist people, apparently insure luggage; they apparently insure to a large amount, and then, when you insure with them, they give you a certificate?—What we usually do is to take out a policy, say, for 100,000l. or 200,000l. as the case may be, and then we insure every work separately with our insurance brokers. Whatever we do not take up, whatever we do not cover, is struck off. I have here the statement of expenditure. As regards insurance, at the Paris Exhibition in 1889 the premium was only 1,225l., at Chicago in 1893 it was 4,438l., at Brussels in 1897 it was 1,200l., at Paris in 1900 it was 1,400l., and at St. Louis in 1904 it was 2,898l.

Mr. Malcolm Ramsay: Can you tell us what proportion the insurance bears to the total cost?—I could not strike the proportion for New Zealand, because I have not got all

the other figures. The insurance for St. Louis was and the total expenditure was 12,188l. At the Exhibition the insurance figure is one-third of the cost.

Chairman: Now we come to the installation; would you say to us about that?—At the Brussels, Paris, St. Louis and Christchurch exhibitions all the pictures hung and everything was complete in every detail on the opening day of the exhibition in the British art section. The only catalogue to be had in the art palace on the opening day at each of these exhibitions was that relating to the British section. For a considerable time after the opening of the St. Louis Exhibition ours was the only catalogue in the art palace. Not even was the American catalogue ready; it appeared only in June or July, I think. At the Christchurch Exhibition the hanging was done in advance prior to the works being despatched, and carefully planned showing the positions which the pictures were to occupy on the walls were sent out with our representatives, and this arrangement was strictly adhered to; the work of hanging was thus not left to chance.

Have you any figures that you could put before us in reference to the sales of British art exhibits?—The experience gained at several international exhibitions is of opinion that many of our British artists fix the value of their works at figures which do not encourage purchase. Foreign artists of the first rank fix the value of their pictures at these exhibitions at more moderate prices, consequently their works, as a rule, more readily find sale. At the Brussels Exhibition but few pictures were sold; at Paris hardly any; at St. Louis we sold 7,000l.—an amount that approached the total value of the British section in all the other foreign sections—while at New Zealand we have sold for close upon 17,000l. This I believe to be by far the largest amount ever taken for modern works of art at any international exhibition.

Were the prices fixed by the British artists low?—Yes, I think, in New Zealand. Have they learnt their lesson?—For that exhibition works were purposely of moderate size and of moderate price. I do not know whether that has had anything to do with the sales, but the sales have been exceptionally large.

Mr. Wilson Fox: Some were bought for 100l. each, were they not?—Yes. I have here the details of the sales, which I can hand in.

Chairman: Perhaps you can tell us now what the expenditure of the art section was at each of the exhibitions?—At Brussels in 1897 the total expenditure was 3,380l., and that was perhaps the best and strongest section of the whole lot. But I ought to say that I acted as hon. secretary, which reduced the cost of the section, as they usually have a paid secretary, and that their office expenses on that occasion; consequently the expenditure was exceptionally low.

Mr. Malcolm Ramsay: Does the figure you give us include general expenses?—It includes packing, transporting and redistributing the works, insurance, decoration of section and installation, wages, &c. The salaries and wages (which were at Brussels in 1897 only amounted to 400l.)

Mr. Algernon Law: Do you see any reason why the expenditure should not be charged on sales, so as to make the expenditure incurred by the Government in the art section?—Do you mean deducting it from the total sales?

Clearly money has been gained through the installation of the exhibition, and I should think that the 17,000l. would make the Treasury officials' mouths shut. I ought to say that from that 17,000l. 10 per cent. was deducted by the exhibition authorities.

Mr. Wilson Fox: What for?—It is the rule in every international exhibition to do that in order to meet their expenses.

Chairman: And you think it would not be fair to take another slice?—It would be most unusual.

Mr. Wilson Fox: They tried it on in New Zealand, the income tax, did they not?—They tried to take a further sum for the income tax, but that was opposed, and it has been dropped.

Chairman: Was it the Treasury out there who suggested that?—Yes.

I would like to say with reference to the New Zealand Exhibition, where we made the strongest display, that we think we have ever made abroad, that the Chancellor, Mr. Edward Poynter, on his own account induced the Government to give 1,500l. towards a special grant, and he and I collected 1,100l. from our personal friends, which

cit of 785*l*, which the London Chamber of Commerce from the Government grant that they had received.

A Government grant they had for the general purposes of the exhibition?—Yes.

The London Chamber of Commerce managed the exhibition at Brussels, did they not?—Yes.

You consider, do you not, that the cost of the art section must be defrayed from a Government grant or from a special fund?—Yes.

Considering the great effect produced, art sections at exhibitions are neither costly to note nor expensive to maintain; but inasmuch as artists never contribute to their promotion in any country, the cost of the art section has invariably to be defrayed from a Government grant or from a special fund.

What do you say about the constitution of the juries?—The constitution of international art juries, the exhibition regulations usually specify that the country in which the exhibition is held should be represented by an overwhelming majority of jurors. Thus in the art section of the Paris Exhibition in 1900, the jurors in Class 7 (Painting) numbered 100 members, of whom 39 were Frenchmen, no other country being represented by more than two jurors and the majority only one. Sometimes one juror is appointed for every hundred exhibitors represented, but this is not often the case. It is obvious that when jurors are brought to examine a work, seen by most of them for the first time, it is difficult for a crowd of 60 or more clustered round a picture to judge efficiently the merits of a work of which they can obtain glimpses.

Should think that is quite true?—Moreover, uncertainties are inevitable in international contests of this kind, where the majority of the jurors are probably ignorant of the careers of most of the artists, and have to form an opinion upon the respective merits of the works, or it may be of a single work, they see before them.

Do you think you consider competitions for awards should be abolished?—The matter of awards presents some advantages, but also many disadvantages. The younger artists are always eager to obtain them, because they have yet to establish their reputations. In the case of other artists whose reputations are already made, who have perhaps received the highest honours which their own and foreign countries can bestow upon them, and who may possibly be conceiving works executed at a period of their lives when they cannot be considered as painting at their best, they at least should not be forced to submit works to the international jury. It can hardly be expected that justice is always done at these international exhibitions. Artists of established eminence may very possibly be represented, frequently are, by works of minor importance executed in the declining years of their fame, which may not justify their claims in the eyes of foreign judges unacquainted most probably with their life's work; whilst, on the other hand, an artist of inferior worth may happen to be represented on the occasion by a work of greater effort and attractiveness. At the St. Louis Exhibition, for instance, it was not permissible by the regulations to withhold individual works from competition.

Do you think in every exhibition you could mark an exhibit as a *concours*?—They could not there, and the result was that we had to withhold the entire section; there was no alternative. France also withheld her section for the same reason. At the St. Louis Exhibition—this is rather an interesting point—a loss to the British art section was the absence of the works of many eminent artists who were prevented from exhibiting with this country by virtue of their American nationality; and many of them actually brought their works to the American section, thereby competing against us. If we had been competing for the awards, we should have had some of our most eminent artists, including a few Royal Academicians, competing against the French. In the matter of awards, it must not be forgotten that awards given in the art section have a totally different value to awards given in the industrial sections. In the industrial sections, where every exhibit is the subject of an award unless it is an absolutely bad one, awards given in the art section are but few in number, and are consequently of greater value. The most ordinary award in the art section is the gold medal, but the silver medal is considered a very high and very important award. Many of the French artists of the highest importance have never received anything like the *grand prix*, which is a very exceptional award in the art section, and is usually given in consideration of an artist's whole career, and at the supposed period of his greatest attainment.

What system of conferring medals is adopted by the international jury?—International art juries employ one of two systems of conferring medals. The one system is not to limit the number conferred; the other system is to limit the number to be awarded. The first course is the fairer; but to my mind the latter course is not only objectionable, but in many cases most unfair. The limitation of awards tells very seriously against an exhibition where there is remarkable uniformity in the average of excellence in the works exhibited, and to allot the few medals at their disposal to a few selected pictures, leaving others of equal merit without awards merely because there are no more medals to give, is unjust and absurd.

When they limit the number of medals do they award so many to a country, and let that country decide how to place them, in order to do away with any international intrigues for getting medals?—I do not think they award any specific number of medals to any special country. They decide at the start that they will give, say, twenty or thirty gold medals, and then they apportion them by vote among the various countries represented. The system that is followed in many cases of deciding how many medals they will give as the starting-point is a very bad one and, I think, is another reason for withholding the section from competition.

Do you mean that you would like to have no medals given in the British art section?—After some experience of international exhibitions and the methods of awarding medals in connection with them I have great doubt of the advisability of our entering into competition for awards at all, although I have none whatever as to the value of a nation's participation in the exhibition, and I come to the conclusion that we should best consult the dignity of our artists by withholding the entire art section from competition. For although a competition with other nations may be interesting, I hold that it is hardly dignified that artists of world-wide reputation should be competing among themselves for medals. It is not the custom for scientific men and other eminent professional men to compete for awards, and our artists should, in my opinion, follow their more dignified example.

Perhaps we may now turn to what you have to say about the results?—With reference to the results achieved in the art section at international exhibitions, I would say that it is impossible to gauge success merely by the value of sales. Its success can only be measured later, if at all. The new reputations made, the new seed that has been sown and the lessons that have been taught and learnt, have also to be taken into account. There are many reasons why British artists should participate in these international exhibitions, quite apart from the question of the sale of their works or from the question of awards. As a result of international exhibitions, works by British artists have been purchased for the picture galleries of the Luxembourg at Paris, for Berlin, Düsseldorf, Munich, &c., while art galleries of Australasia have sent their representatives to select and purchase works at the recent New Zealand International Exhibition. As the result of exhibiting a portrait in the British art section at Brussels one of our eminent artists received a commission to go over to Brussels to paint the portrait of a distinguished lady, and this commission led to many more and at English prices. As a result of the British art display at the St. Louis Exhibition, modern British pictures are now better appreciated in the United States. In proof of this I may quote the following telegram from the *Times* of March 16, 1906:—"English Art in New York.—Our New York correspondent telegraphed last night: 'Sir L. Alma-Tadema's *A Sculptor's Studio* was sold at an auction in New York last evening for 23,100 dols. (4,620*l*). Recent sales here have shown a growing appreciation of modern English pictures.'" That, we think, was the direct outcome of our participation at St. Louis. I think the most important result of all of a successful art section is that it frequently helps to score a success for the British section as a whole—I mean when the industrial section is perhaps a little weak. I have some further notes with reference to the results of the New Zealand Exhibition. This is an extract from the *Lyttelton Times* for April 15, 1907, which gives more information of the exhibition than any other paper:—"British arts and crafts will have a lasting effect in the homes of the people of Canterbury, at any rate. . . . Quite a large number of people have written to the manufacturers in England with the object of obtaining articles such as those displayed at Christchurch. . . . From all points of view the gallery has been a great success. The attendance compares very well

with that at the St. Louis Exhibition, and the colonial public has expressed its admiration for the gallery's treasures in a most practical manner, the sum of 15,362*l.* having been spent in purchasing pictures and other works of art." This is referring to an earlier date than my own figures go down to.

It is 17,000*l.* I think you said now?—Yes.

What suggestions for improvement have you to make?—With reference to possible improvement in organising British art sections at international exhibitions, any change that would prevent the delay in organising an art section in its initial stages would greatly assist any commission or committee charged with its formation. At present the delay very seriously threatens the prospects of a successful result. To prevent this in future I would suggest that a permanent department should control all the British sections, including art, so that the moment the Government decides to participate in an international exhibition, the art committee could at once get to work and secure good and ample space. The chairman of the art committee should always be the President of the Royal Academy for the time being, and his committee should have full control of the art section and of its financial grant, as heretofore. A special department exists in France for the organisation of art sections at international exhibitions. I have references here to that French department which I will put in with your permission.

Do you want a standing committee or a special committee appointed for every exhibition?—I should not have a standing committee, especially for art.

You mean that you would not have a special permanent committee?—No, not a special committee for art. I may say that the French Government has a permanent office for art under the control of the Minister of Fine Arts, but that again is controlled by their department relating to international exhibitions on the Continent.

And, I take it, it would be outside the *société* or *comité* that we have heard of which contains most of the commercial people and the other sections?—It is quite outside that. The time required to organise an exhibition is considerably greater than it takes the exhibition to run, and the process of winding up is an equally long operation. The time between the closing scenes of the one and the opening scenes of the next is often very short, so that a permanent department, if one were established, would not long remain idle. It might even be utilised for other purposes in between. If it can once for all be decided that it is beneficial to this country to participate, or if we decide that our country cannot afford to be the only one to hold aloof from great international exhibitions, then we should start fair at these exhibitions in competition with other countries. Another possible improvement in organising the British art section is one which I tried with success in connection with the New Zealand Exhibition. On that occasion, when I acted alone, I measured the lineal space, and carefully calculated the amount that might fairly be apportioned to each school of painting in the oil and water-colour sections. I then enlisted the assistance of the presidents of each art society. The presidents being intimately acquainted with the members of their societies and their best works, were thereby able to offer suggestions with respect to artists or their works.

Was that the way that you got most of your pictures at the last exhibition?—Yes.

You were very successful with the others; how did you get the pictures then, generally speaking?—As a rule it is the large committee, the art committee, which determines who should be invited and which work should be invited. At the New Zealand Exhibition I rather subdivided that work, and I got each president of each society to help me in either nominating the artists or nominating their works—each art society formed a sub-committee, as it were.

I suppose you have a number who volunteer and who are not always the best?—Those always come before the committee. They have to be judged and the great bulk of them, of course, rejected.

Mr. Wilson Fox: Following up what you have said about the New Zealand Exhibition and the way in which you prepared the art exhibit, did you not find, as a matter of fact, that when you managed it and practically organised it, the path was rather smoother, because there was less jealousy of a man like yourself who is not an artist taking it up than there would have been if a particular art society had endeavoured to run the getting up of the exhibit?—I think that possibly facilitated my work.

You were in a more independent position, and there would not be that jealousy when anybody in your position

was acting which there would have been if an art society had been acting?—Perhaps.

Mr. Harris: With reference to the commercial result, do you not think that it is questionable how far we have been justified in giving a number of our artists an opportunity of getting a special sale for their pictures at the expense?—From the commercial standpoint I think that is an open question, but as it always helps to make an exhibition attractive, and as the artist is not usually a man who can afford to pay much, if anything, towards the institution, I think it is an advantage that cuts both ways, and that it helps the exhibition quite as much as the artist.

It seems to me pretty clear from your evidence that the artist appreciates it, because I notice from the figures you gave that the artist exhibitors have been rising in number as compared with the loan exhibitors—in New Zealand, for instance, you had some 400, I think?—That we had 475 artists exhibiting and only about 30 private owners. But that may be on account of the very distance, and because private owners are unwilling to send their things go so far.

Do you not think that probably what influences the artist is that he really feels that he has got exceptional advantages which perhaps he would not get elsewhere? That may influence him sometimes, but we also occasionally the greatest difficulty in inducing an important artist to send, and then we have to fall back upon a private owner if we want a representative work of a particular artist.

Has it struck you that in selecting for exhibitions, particularly abroad, you take a considerable risk in this way that the committee composed of the President of the Royal Academy, and so forth, select what appear to them to be the best things, but that it does not necessarily follow that the pictures rejected will not be the things that really would tell abroad—I mean, tastes differ?—Yes; but then the committee consists of so many members of different views that they are all likely to prevail in some instances, and care is taken now to send representative pictures by members of the New English Art Club and of the impressionist school.

That brings me to another point that I was going to mention to you about. You speak of the difficulty that you had at St. Louis owing to the regulations which compelled an artist to submit his works to the jury; but could not that selection have made it possible beforehand to avoid the difficulty of that sort? Should you not, I mean, have been able to avoid the two difficulties you have mentioned—of all, taking the works of a man at his worst period, then, secondly, of taking the works of a man whom you really did not like to put in competition at all?—At an early stage at St. Louis we tried to induce the exhibition authorities to concede that point, that we might be allowed to withhold works of certain artists who would not compete, but they would not give way. Thereupon we said if that was the case the whole section must be withheld from competition.

Was that before you went out?—Yes; it was before we invited artists to participate.

So that was quite early?—Yes.

Mr. Malcolm Ramsay: Is there any charge made for space in the art galleries to the artists?—No.

To the section?—No.

I cannot find it mentioned in the accounts.—You would not.

There is a charge in the industrial section, but in the art section you say the space is given by the exhibition authorities?—The space is given free, but the rooms are given in an unfinished state, and we have to decorate them and finish them at our own cost.

Returning to the question of payment, is it not the case that a comparatively small charge to each exhibitor would have made the art section practically self-supporting at the recent exhibitions?—I do not think you would be able to do it.

Perhaps you can tell us what the cost per exhibitor has been at the last four exhibitions we have been particularly considering?—At Brussels, 1897, the cost per exhibitor was 13*l.* 1*s.*; at Paris, 1900, 19*l.* 1*s.* 6*d.*; and at St. Louis, 17*l.* 5*s.* 3*d.* I have not yet the completed expenditure for New Zealand, so that I cannot give you the figure for that exhibition. I may say that at the Chicago Exhibition which was held in 1893, the cost per exhibitor was 22*l.* head.

So, assuming that the State thought it reasonable to make the artist pay something towards his free advertisement

ent—I am putting it in a brutally Philistine way—a sum of 5*l.* to 10*l.* would go a very long way toward paying the cost of the British art section?—It would, but it would be an innovation, and I doubt very much whether they would refuse to participate.

### MARSH'S LIBRARY, DUBLIN.

ADJOINING St. Patrick's Cathedral, Dublin, is a library founded by a former archbishop, but the funds for its upkeep are inadequate. At the annual visitation on Saturday, the library keeper presented the following report:—

It is to be regretted that some adequate provision cannot be made for the maintenance of this most interesting monument of old Dublin. The will of the founder, Archbishop Marcissus Marsh, provides only about 9*l.* per annum for repairs, and, although some at least of the librarians had acted in a public-spirited manner in the matter, the building was, according to W. Monck Mason, "rapidly approaching a state of utter ruin" when he published his History of St. Patrick's Cathedral in 1820. However, in 1862 Sir Benjamin Guinness munificently undertook the restoration of the library fabric, as well as of the cathedral, and also provided further endowment for books and repairs. This fund, so far as repairs are concerned, brings in now a little over 100*l.* per annum. Last year we had from all sources 175*l.* 5*s.* for repairs. If the fabric were quite new this might suffice for painting and keeping the roof in order. But a house over 200 years old is in constant need of such permanent repairs as may be called restoration; for example, last July, the pointing and restoration of an outside wall cost 24*l.* 6*s.* 3*d.* Since 1902 the library keeper has paid out of his own income over 80*l.* towards repairs, including more than 20*l.* last year. This is reasonable and fair, as there is no other means of meeting an ordinary deficit. But at no distant date the complete reconstruction of the roof will become a pressing necessity. This may cost anything between 200*l.* and 300*l.*, and there are no funds to meet such a demand. It is a pity that an institution which served Dublin well as its only public library for over 150 years, and which is still a mine of literary and antiquarian interest, should be in such straits. Last year reported the recovery to the library of a portion of the correspondence of Dr. Elias Bouhereau, the first public librarian of Ireland. I have thoroughly sorted and arranged these letters, and by their aid have prepared a memoir of his life, which I trust may be printed before long. In this connection I have to thank M. de Richmond, archiviste of La Rochelle, for valuable information and suggestions, and also the officials of the Public Record Office, Dublin, for their kindness in helping my researches there.

### How Architects Get Work.

SIR,—In your issue for September 6 the interesting contribution under the above title has brought some consolation to my troubled soul, albeit the writer stops short of real dealing because he wholly misses the one and only method of getting work.

When, twenty years ago, the late Mr. Piers St. Aubyn was signing my papers for membership of the Institute, he inquired what I was going to do about the practice I intended to start, as I had no friends to "influence" work. My reply was that I knew no more than that if a "job" came I would carry it out to the best of my ability, and so let my work be a recommendation for other commissions. He assented, but warned me that I should have "an uphill road." It was and is still uphill work, yet during these twenty years I have had a fair share of work, and among the commissions good many public buildings, as you will see by the enclosed list, which I do not want you to publish lest such a free advertisement should bring me such a shoal of commissions that I should want an army of clerks to cope with; or, on the other hand, the architect-employing public might think I had made a fortune and need no more work, which would be a grievously erroneous conclusion.

But now, after all these years of steadily holding before my mental vision the ideal of good work as the only legiti-

mate means of getting other work, I am roundly upbraided for not "mixing" in society so as to get more commissions; yet I go on, and shall go on, believing that as with the shoemaker so with the architect. If the former makes a pair of shoes which are a perfect fit and a pleasure to wear, the wearer recommends him to other "clients." Likewise the architect who does a good work—putting his soul into it—gets recommended to other work. It is the only way.

But you tell us that "the best agency for becoming known, the one that has an effective part in the upbuilding of every architectural reputation in these days, is nothing more nor less than the printing press." Now please turn to the volume of *The Architect* for, I think, 1894, and you will see how the printing press, as exemplified in your pages, helped my reputation. There you will see the names I was called in the notice of my "London Rookeries and Colliers' Slums." It was hardly the kind of recommendation to lead to architectural commissions. Yet I am unrepentant, and of that little work and of many other "socialist" brochures I am as proud as I am of my best work in stone.

But you have done me the *amende honorable*; you have published one of my Egyptian jobs, without my asking you to do so, in the very number containing the article on methods of getting work, which free advertisement will, doubtless, help me to reap my share of that "effective part in the upbuilding of every architectural reputation in these days" afforded by "nothing more nor less than the printing press."

As regards my own practice the aim which I have steadily kept before me *does* bring me work. It was thrown at me the other day "that while my work was known I was not known personally," and it was explained to me that to be personally known brings work. Yet within a few days of this utterance I had a letter from an old client for whom I had successfully carried out a difficult work, informing me that a possible client would like to see me in a distant town. Result—sketch plans made, approved, and within four weeks the excavations commenced for a building of six storeys covering 900 square metres. Besides this, although I am just now forced to be 3,000 miles away from my British practice, I have two commissions at home which have come through nothing but the endeavour to put my heart into the work entrusted to me, even as I promised my old friend and employer Mr. St. Aubyn.

For the man who joins a club, becomes a Freemason, goes to afternoon teas, gets to "know everybody" that he may rake in a commission or two, I have the profoundest contempt. I am ready to lend a hand to any practitioner who needs the help and sympathy of an older man, but to follow the dubious practice of using the occasion of social amenities to get work I set down as reprehensible, if not improper, conduct on the part of an architect. If it be true, the one blot on the character of one of our finest architects, lately deceased, was that he said he "got more commissions in a dress-coat than in any other." It was a paltry use to which to put a dress-coat; the waiter in his dress-coat accepting his tip is more honourable.

Now let me tell you something. Advertising for a post in *The Architect* twenty-seven years ago brought me, indirectly, what was far better than a post or commission, namely, a partner for life, who, though she knows an architect with ideals must perforce remain poor, yet believes that no goal that is worth reaching can be reached by other than the way of Truth. And, mind you, drawbacks notwithstanding, the path which I have chosen is strewn with the flowers of love and joy in one's work, and through which, as one fares along, one meets with that fellowship which William Morris truly describes as "heaven." It is a jolly road, and I recommend it to all young architects.—

Yours,

ROBERT WILLIAMS.

St. David's Buildings,  
9 Cherif Pasha Street, Alexandria.

### Crosby Hall.

SIR,—In the *Penny Magazine*, December 1832, is a minute account and engraved view of this famous hall, described as the "only considerable monument of domestic architecture of the fifteenth century now remaining in London; the finest and most magnificent specimen of her old civic palaces." If at that time, in 1832, a committee was formed to preserve it from decay, is it not a thousand times more urgent to arrest its destruction at the present crisis? To Charles Knight, the once well-known publisher, the antiquary and historian have long been indebted, and the *Penny Magazine*, though seldom seen in

this progressive age, did a good work in chronicling the historic sites and houses which have gained for England a merited repute from many a distant clime.—Yours,

S. W. KERSHAW, F.S.A.

#### Education in Architecture.

SIR,—Would you permit me through the columns of your valuable paper to add my testimony and warm tribute to the practical utility of the Liverpool Central Municipal Technical School, and the benefits derived by its students in the practical branches of the building trade? A series of recent examinations have taken place, and the competitors next May will have an opportunity of competing for the scholarship at the University of Liverpool. It is most gratifying to architects whose pupils have received certificates. Master Robert Parry, who is serving his articles with me, has been successful in passing six examinations (being the number he entered for), with the following results:—1, Ordinary grade of masonry, first-class pass and prize value 2s. 6d.; 2, ordinary grade of brickwork, first-class pass and prize value 2s. 6d.; 3, ordinary grade of plumber's work, first-class pass and prize value 2s. 6d.; 4, building construction, second-class pass in stage 2; 5, practical plane and solid geometry, second-class pass in stage 2; 6, mathematics, second-class pass in stage 1, and lastly, a best homework prize value 3s. 6d. in brickwork and masonry class. Doubtless it will tend to inspire architectural students with the ambition to take the degree of B.A. (or a diploma) in the Honours School of Architecture. As Ovid says:—

The applause, the favour of our fellow men,  
Fans even a spark of genius to a flame.

The above honours can be fortunately obtained in our local university, presided over by the erudite Roscoe Professor C. H. Reilly, M.A. A deep and lasting debt of gratitude is owing by the members of the profession to his accomplished and unassuming predecessor, Professor Simpson, and *inter alia* Messrs. Willinck & Thicknesse and Mr. Henry Hartley, F.R.I.B.A. (in conjunction with our city fathers), who have striven to raise the status of our profession "by providing for architects professional education of a university standard side by side with the students of other professions." It is not generally known that the "Picton Reading-room" adjoining contains a priceless store of rare and choice tomes anent all the above subjects second to none outside the Metropolis, and that every assistance is rendered by the courteous and able staff of assistants (under their worthy veteran chief, Mr. Cowell), and to whom I am greatly indebted during my antiquarian and historical researches during the last four lustrums.

The ultimate effect and benefit of technical schools will be to bring about a better condition of building construction. Every artisan that enters them will be stimulated to take a greater pride in his work. The master mason will revel in setting out arches with traceried cusped tympanums, groined arches and capitals. The master bricklayer will advocate a better bond of brickwork, and we shall see more of "old English bond" and "Flemish bond" and less of "garden bond" in our buildings, and certainly more 14-inch main walls and less of 9-inch ones, as the latter never can make weathertight gables, and, above all that, he will see that the walls rest on a solid foundation and not on made ground.

The master plumber will take a greater pride in seeing that the lead water joints are properly wiped, which are considered to be a work of art in their egg-like form when rightly shaped. The gasfitter will use our worthy diocesan architect's air pump (gauge) in testing gas piping after completion, instead of the rule-of-thumb method of blowing down the pipes, as defective gas piping (and fittings) is a fruitful source of death, and they will see that gas hooks are used, and not allow iron-floor brads to be substituted in fixing the pipes.

It is to be hoped that ere long the architectural profession will become a close one, and that no person can assume the title of architect unless qualified to do so. It is most regrettable during one's practice to interview improperly-trained youths applying for situations, and when interrogated as to their qualifications they admit that they cannot prepare an estate plan, survey the site and level same, and show a system of drainage with inclinations, working from the Ordnance or other approved datum, in order to pass the local authority. All that they really can do is to prepare drawings of houses from sketches and

make tracings. Many of them are not able to distinguish the difference between a Corinthian capital from a Tuscan one, much less point out the transition periods of Greek architecture, or distinguish between the salient features of the Elizabethan or Queen Anne styles.—Yours, &c.

J. H. M'GOVERN, Architect.

Liverpool: October 14, 1907.

#### GENERAL.

M. J. Bréasson, of Paris, has obtained the first prize in the international competition for the University of Sofia.

**Considerable Damage** is threatened to the fabric of Southwark Cathedral by the emission of noxious fumes from the neighbouring factories, and the chapter clerk is approaching the Borough Council, in the hope that the authority will take whatever measures are necessary to prevent the emission of the fumes.

**The Estate** of the late Mr. Henry Calcott Brunning of Brighton and London, stockbroker, has been valued at 115,000*l.* Mr. Brunning bequeathed to the nation such of his pictures as may be selected by the trustees of the National Gallery.

**Steps are being Taken** by the Nationalists' Club with a view to the creation of a memorial on Flodden Field, near Berwick-on-Tweed, to mark the spot where King James VI. of Scotland fell. There is at present no monument of the great battle. When a site has been secured a national Anglo-Scottish committee will be appointed to carry the matter through.

**The Old Church** of St. Thomas, Park Lane, Liverpool, is to be removed and a new one similarly styled is to be erected at Ashfield, Wavertree. The committee have decided upon plans for the new building, the design of Mr. R. W. Owen having been selected out of a number of competitions by Professor Reilly, the assessor.

**The State Architect** of New York, Mr. G. L. Heins, died on September 25 in his forty-ninth year. He was appointed by Mr. Roosevelt in 1899. He was formerly a member of the firm of Heins & La Farge, the architects of the cathedral of St. John the Divine.

**Dr. Charles Waldstein**, Fellow of King's College, University Reader in Classical Archæology and formerly director of the FitzWilliam Museum, was on Tuesday re-elected to the Slade Professorship of Fine Art. Owing to recent changes in the statutes governing the tenure of that professorship Dr. Waldstein now becomes permanently professor, and it is understood he will resign the Readership in Classical Archæology. Since the spring of 1880 Dr. Waldstein has lectured on classical archæology in the University every year, and with few exceptions (while he was exploring in Greece) every term.

**A Sculpture Gallery** has been added to the Watts picture gallery at Compton, Guildford, and was opened to the public on Wednesday. Two notable works of the new gallery are the originals of the statue "Physical Energy," and of the statue of Tennyson, which latter occupies a corner of the Minster Green at Lincoln. There is also a bronzed plaque of the Bishop of Lichfield taken from the bronze in Lichfield Cathedral, and there are a number of studies, including drawings and paintings, which adorn the walls. Mrs. Watts is making arrangements to allow students to have access to the gallery and work there in the mornings. It will be open to the public daily, except Thursdays.

**The American Institute of Architects** will hold their forty-first annual convention in Chicago, November 18-20, in the Art Institute. The programme in full is not yet published, but it has been decided that, as nothing of an ornamental nature can be scheduled, the leading papers and most important discussion shall be devoted to the consideration of reinforced concrete construction.

**The Committee** having charge of the erection of the Liverpool Cathedral report that "considerable damage" has been recently done by persons visiting the works, and that there have been instances of the appropriation of pieces of the building as souvenirs. For these reasons, and having regard also to the congested state of the site and the presence of machinery in motion, the committee find it desirable to considerably restrict the number of visitors to be admitted. Large parties cannot at present be allowed, but individual applications will be considered and granted on a distinct understanding as to strict observance of regulations. An anonymous benefactor has offered 10,000*l.* towards the erection of the Liverpool Cathedral.

# The Architect.

## THE WEEK.

seventy years have elapsed since the Polytechnic Institution was established. It was a bold attempt to popularise science, and needless to say many promoters lost a large sum. Of late years as a technical school there can be no question about its value. Some of the leases will soon expire, and applications have been made to the trustees of Lord HOWARD DE DEN, the freeholder, for a renewal. The whole site is about 25,000 square feet. A lease for eighty years without premium has been offered on reasonable conditions, but it will be necessary to the part of the premises facing Regent Street, the outlay is estimated at from 50,000*l.* to 60,000*l.* The Governors have applied to the London County Council for a grant of 20,000*l.* towards the cost. It is estimated that 10,000*l.* can be raised by subscription, and 10,000*l.* can be obtained by loan at 4 per cent. It was proposed to arrange the ground floor so as to obtain 100,000*l.* from which a rent of 1,000*l.* a year is expected to be received. By the new financial arrangements it may be possible to largely extend the utility of the building. But if the County Council decline to support the Governors the education would have to be discontinued or it would be necessary for the institution to be closed. The educational committee have approved of the arrangement, and there is little doubt they will grant the money required.

Legal action brought by Messrs. PEARSON against the Corporation of Dublin has been recommenced in accordance with the decision of the House of Lords, by which the Corporation was ordered. It will be remembered from reports already given that the plaintiffs claim compensation for loss sustained by them owing to imperfect main drainage works. A wall was shown by the Corporation which was supposed to serve as the foundation for the new wall of a reservoir. But when PEARSON attempted to utilise it it was found to be without the requisite solidity. The first trial was before the Lord Chief Baron, who directed a verdict in favour of the Corporation. By a coincidence an application was made in his court for a subpoena. His Lordship expressed the hope that he would not have to hear the case, although he was to hear jury cases in the morning. He considered it would be more satisfactory if the present Judge presided.

In the fifties of the nineteenth century, besides the Royal Academy and the British Institution, there were some others for drawing and painting from the living model. There was the Artists' Society in Regent Street; the Life Academy in Margaret Street; the school founded by SASS in Bloomsbury; CHARLES LUCY's school and the General Practical School of Art, with J. M. LEIGH as master, in 75 New Street, Oxford Street. The last has survived, under the name of HEATHERLEY's, has attained an international reputation. According to the original advertisement:—"This school offers to artists, designers, draughtsmen the practice of elementary, geometrical, and perspective drawing; drawing from the antique and the model (male and female) and modelling; with a special examination in anatomy and lectures on other branches of art. A select library for circulation amongst students. Morning class for ladies or gentlemen, particulars of which may be obtained at the Gallery. Evening class for gentlemen every evening from seven till nine. Elementary, geometrical and perspective drawing, drawing from the antique and life, study of anatomy and modelling. Terms 7*s.* 6*d.* per month, or quarterly 2*5*s.**." THOMAS HEATHERLEY was one of LEIGH's pupils, and under his control the school became a

London institution. He was succeeded by Mr. CROMPTON, whose name is well known to modern artists. The school is about to be removed from No. 75 to No. 79 Regent Street, and under Mr. H. G. MASSEY's direction we hope it will enter on a new era of success. HEATHERLEY's has been long enough established for the creation of traditions, and earnest students will, under more favourable conditions than their predecessors, be able to supplement the knowledge they derived from other sources.

ACCORDING to the newspapers Mr. EDISON has found relaxation from his inventions for the employment of electric power in endeavouring to solve the cheap cottage problem. It must be said there is not much novelty in his proposals. Several years ago walls were constructed by pouring in concrete between a framing or double lining of boards which were afterwards removed. For boards Mr. EDISON would substitute cast-iron moulds. His concrete would consist of one of cement to three of sand and five of crushed stone. The concrete would be poured into the moulds until they overflowed, an operation which is supposed to occupy twelve hours; and after six days the cast-iron could be removed. A concrete which is so fluid is not likely to commend itself to builders, although Mr. EDISON, we suppose, has made experiments with the material. He estimates that the cost of a three-storey house, 25 feet wide and 45 feet deep, could be erected complete for 200*l.* That would be less than 2*d.* a cubic foot. Cheap houses are, no doubt, desirable in other countries besides the United States; but it is doubtful whether the proposed castings would be as economical as is imagined.

It appears that complaints are common concerning the number of copyists who obstruct the visitors in the picture galleries of the Louvre. According to an official return no less than six hundred and sixty-six men and women have the privilege of setting up easels before the paintings. For a large work it is necessary to have a sort of platform attached, and the easel is therefore cumbersome. In reality the inconvenience is far less than is imagined. The six hundred copyists are never congregated on any day in the Louvre; sometimes one-tenth of the number are not to be seen. As they have to work at a distance from the originals, they do not intercept the view of the majority of visitors. There are, however, people who take a pleasure in creating a grievance. The authorities of the Louvre must also be aware that the copyists serve as honorary guardians. The paintings which lately were damaged are among those which are never copied for any public or private collection.

THACKERAY was disillusioned when he arrived at the Giants' Causeway. "Mon Dieu!" he exclaimed, "and have I travelled one hundred and fifty miles to see *that*? I declare, upon my conscience, the barge moored at Hungerford Market is a more majestic object, and seems to occupy as much space." The Americans apparently esteem the basaltic formation more highly, for they have commenced the transport of the columns to Philadelphia. The first consignment will weigh about 200 tons. It will be asked whether there is no power in Ireland to protect the Causeway. Although at one time it was supposed to be the work of the giants who abounded in Ireland, and to whom a piece of construction about a furlong in length would be child's play, it is not in a legal sense an ancient monument. The Irish Courts decided that the stones belonged to a company, and since that time the causeway or pier cannot be seen without payment. It may therefore be assumed that the disposal of the basalt is a legal transaction. America is fast becoming a great museum, and it will be incomplete unless several of the natural as well as the artistic "curiosities" of Europe are to be found somewhere in the States.

## GEORGE FREDERICK BODLEY.

AFTER more than fifty years of labour an architect who endeavoured to impart so much of his individuality to his works as the late GEORGE FREDERICK BODLEY would welcome repose as his reward, but he would no doubt have been solaced if he were assured of seeing the cathedrals in Washington and Liverpool, with which he was associated, advanced to a stage that would be suggestive of their future impressiveness. Although so much happiness was denied him, GEORGE BODLEY could look back on completed works which are not only creditable to his own and his partner's skill, but which are assertive of the power of Mediæval art in comparison with experiments in other styles. He could claim to be inspired by the Gothic spirit not only in his designs but in his conduct. Every one knows of the obscurity which surrounds the architects of that period. It is rarely we can say with any certainty who was the designer of a cathedral or church which enforces admiration from all lovers of art. The architects might have anticipated FLAUBERT in believing that "L'homme n'est rien, l'œuvre est tout." In the nineteenth century artists, however modest, have to submit to the demand for publicity, but, as far as was possible, GEORGE BODLEY endeavoured to escape from it. His was a retiring nature, and he could say the fierce light often evaded him. There was no architect of his eminence in England about whom so little was known.

THE LATE G. F. BODLEY.—A SKETCH.

He was the son of a physician in Brighton, and was born, it is believed, in 1827. As the first pupil of the late Sir GILBERT SCOTT, whom he joined when eighteen, he had the advantage of participating in some of the struggles of the Gothic Revival. In those days apprenticeship lasted during five years. That was a sufficient time for SCOTT's system to become evident to a less able youth than GEORGE BODLEY. It was so perfect it seemed almost mechanical. Enthusiasts were therefore not fascinated by the applicability, for it is a remarkable fact that several of SCOTT's pupils, when they entered on practice, treated Gothic in a manner which was almost a condemnation of their master's work. SCOTT's ideal was to be found in Salisbury Cathedral, and it was well adapted to a time when machinery, and workmen who were little better than machines, were to give expression to Gothic forms. GEORGE BODLEY, on the contrary, sought an ideal in French Gothic, and it was exemplified in the original form of his first church, St. Michael's, Brighton. It was recognised as a novelty and its variety was found to be economical. In con-

sequence commissions for many churches came. In 1854 he was an exhibitor for the first time at the Royal Academy. His contribution was "New and Master's House, Cheltenham." It was characteristic of him that during the succeeding nineteen years no work of his was to be seen there. When he appeared in 1873 it was with the design for his office of the School Board offices on the Embankment. It was evident that French influence had not lost its hold over him or his partner, THOMAS GARNER, who was a fellow pupil with him in SCOTT's office, and during a great many years so loyally co-operated with him, that it will hereafter be difficult to distinguish between their respective shares in churches and buildings.

It was not to be expected that an architect skilful in designing detail should always adhere to Cistercian simplicity. SCOTT considered that the difference between his churches and those of the STREET was that in the latter what is generally considered as ornament received more attention. After a similar difference from the type of SCOTT was present in the churches of BODLEY & GARNER. For the nineteenth century work reassumed importance in their hands which could not be anticipated by anyone who considered the Brighton church as a confession of style. Indeed, it was as an upholder of English Gothic maturity that BODLEY considered he had any claim to the gold medal of the Institute. The words he used were well deserving of attention, as expressive of the contentment of his mind:—

I think I owe this honour of receiving the gold medal more especially to my great love for that style of architecture which I have always held, and do hold, to be the most beautiful style—I mean the English Gothic of the thirteenth and fourteenth Ages. I believe that this style is like Greek work in its great refinement and great delicacy. Architecture reached a perfection of which we have hardly a parallel now. Our work is so confused, so mystified by the styles. In old days there was unity of feeling, and we must but think that the more we can hark back and try to get one style the better it would be. This may be Utopian, but it may be impossible; but what a thing it must have been those days not to have muddled in selecting a language to speak in. There was one language; for, after all, there was only one language. If a Frenchman has anything to say he says it in French, if an Englishman in English, a German in German, and so forth. And now we think so much of styles and do not think enough of what we have to say, what we have to tell the world, that is, that nature is right, nature is beautiful, architecture and all the arts have been established and built up, generation after generation, by the traditions of

When we speak of detail it would not be fair to lay on our part if the circumstance were ignored that many architects vigorously condemned Mr. BODLEY in connection with a manufacturing firm or commercial enterprise, the production of "art workmanship." It was the example of so prominent a man was likely to have pernicious effects, especially with any member of the profession who regarded architecture mainly as a means of possibilities of money-making. Gothic men particularly condemned him. It could be said that there were some precedents for the practice. But the circumstances of that time and of ours make it dangerous for any architect to combine the offices of judge and tractor. There was never the least shadow of suspicion that with Mr. BODLEY a client suffered in anything through his commercial enterprise. The numerous commissions he received from bishops and clergymen were sufficient proof of the confidence in his honour.

It would need several pages to do justice to his works. He conducted the restoration of Peterborough Cathedral and latterly of York Cathedral. He especially gave rise to the customary contention about altering the character of the building. He was successful in the competitions for the cathedral at Truro and Liverpool. In the second competition for the latter Mr. BODLEY was associated with Mr.

in judging the designs. When Mr. GILBERT's design was selected he engaged to give him of his long experience in conducting the work, we suppose enough has been done to realise attention. Mr. BODLEY was also associated with HENRY VAUGHAN for the new cathedral of London at Washington, and we lately published their opinion of what was contemplated. The cathedral part has been carried out from BODLEY & GARNER's. Another cathedral with which he was connected was of San Francisco. In both Oxford and Cambridge many important additions were made by the firm of colleges, and it is generally believed that the works were mainly controlled by Mr. GARNER and the latter by Mr. BODLEY.

Among the churches carried out by the firm may be mentioned St. Michael's, Camden Town; Holy Trinity Church, Kensington; the Eton Mission Hall at Hackney; All Saints, Ecclestone; Clumber Church, for the Duke of NEWCASTLE; Ecclestone Church, for the Duke of WESTMINSTER; the church for the Society of St. John the Evangelist, Cowley; St. Augustine's, Pendlebury; churches of St. Germain and St. Saviour at Cardiff; church of Holy Angels, Hoar Cross; church of St. John, Tuebrook, Liverpool; All Saints, Cambridge; St. Martin's, Scarborough. In these works Gothic was treated with freedom, but in a manner which suggested a recognition of the true principles of the style. Most of them have the advantage of realising what was attempted. The unfinished look which unfortunately is not uncommon with modern English churches is generally absent from them, and the satisfaction which the visitor feels on entering one of the churches is not without its effect when judging of the work either as a whole or in its details. GEORGE BODLEY loved colour, and he endeavoured as often as practicable to employ it. He sometimes aided in the mural painting of his churches. His colourwork is skilfully arranged, and with more moderation was usually exercised in Mediæval buildings. His principal mansion which can be credited to his firm is Pynwell Grange, belonging to the Earl of PLYMOUTH. BODLEY was elected an Associate of the Academy in 1882 and six years ago he became an Academician. In building he selected to represent for his diploma was St. Mary's, Clumber. After 1881 the firm was to exhibit, and designs sent in later years were under BODLEY's name. It may seem strange that an artist of his standing did not obtain the distinction until he passed his seventieth year. But this must be attributed to the seclusion in which he lived for the greater part of his life. He endeavoured to depend on his own abilities without any aid from friends or from fellowship, and it must be owned that he was successful. He loved music and literature, and a few years ago hazarded the publication of a volume of poems so that his retirement was not without compensating influence. GEORGE BODLEY could be considered a survivor of the band of architects who took the lead from PUGIN and kept it burning for sixty years. His style is not yet extinguished, and there are strong reasons to carry it on to a new generation.

## THE ANCIENT ROMAN HOUSE.

It was an example of good sense when, at the meeting of the Classical Association on Saturday, a paper was given by Mr. WARD FOWLER on "The Decay of the Roman House-life shown from the History of the Roman House." That is a subject which has been generally neglected. At the time of the Renaissance when new interest was taken in the Greeks and Romans, it was, we suppose, only natural—or it may be professional—for the scholars to endeavour to exalt the position of both peoples. What then happened was that to what has been seen in Ireland for at least a century. The revival of old legends and an examina-

tion of carved stones and metalwork made the Irish people imagine that they were the descendants of races who lived in buildings with wonderfully carved ornament on the walls, and wore garments which were held together by most elaborate brooches. The Italians also were enslaved by their imagination, and all the representations of ancient life which were produced by their artists presented the noblest buildings that could be devised. The character of the houses in which Greeks and Romans lived was not investigated. Later ages could not repair the neglect. As a consequence there are two opposed theories on the subject among archæologists. According to one, the cultured Greeks in Athens lived in tumbledown houses, which the wretched dwellings in the semi-civilised countries of Eastern Europe are believed to recall, while in Rome the people were supposed to live in the small rooms of badly-built houses erected in the narrow streets. Others maintain that people who were able to display so much architectural skill in their public buildings were not likely to be satisfied with mean dwellings. VIOLLET-LE-DUC was not afraid to adopt the latter theory, and in his *Histoire d'un Maison* he has introduced views of imaginary Greek and Roman dwellings which are beautiful and luxurious.

In dealing with the Roman house the difficulty is to know when to begin. ROMULUS, like a great many other ancient worthies, is to some German scholars little more than a myth. But the Romans believed in him, and for a great many years they preserved a house in which he was supposed to have lived. No doubt it required regular renewals, which were probably carried out in secret, in order that simple people might believe he was the son of MARS, and as he had become one of the gods was able to uphold his earthly dwelling-place. Apparently it was a simple hut such as shepherds use, for cattle ranches in sociology had precedence of agricultural land.

It is impossible to determine when farming was added to the raising of cattle and when trade superseded bartering. But if we may judge from Roman literature and from what is recorded of several of their great men, the love of farming continued to be almost an instinct during many centuries. The longing for the country and a rural life forms one of the great differences between the Greeks and the Romans. The Greeks had country houses and farms. But we do not find expressions of desire to find peace there, as in works of Roman writers, nor do we hear of statesmen and warriors looking to the country as the refuge from all cares.

It was not, however, the change of air or the pleasure of sharing in rural sports which the Romans alone sought after. For the time being they wished to be patriarchs, to be surrounded by descendants, kinsmen and retainers who looked up to a landowner with more or less reverence. The farm was also a place where, if he belonged to a good family, a man could be inspired by the memory of his ancestors, and, indeed, feel as if they were present. The Romans recognised that progress was a law of the world. JUVENAL describes a visit to his own farm by his friend PERSICUS. He points out that the place is very homely, but the satirist also reminds his visitor that, such as it is, the house and its furniture would at one time have been thought luxurious by many of the ancient worthies.

It would be impossible at the present time to give a description of an English country-house which would be suitable to all. We need not therefore be surprised if there are differences between the accounts which have come down to us of the rural retreats of Roman gentlemen. In reading about them it is very difficult for us to eliminate from our minds a belief that all classic buildings resembled minerals, and were arranged in a specific way from which there was no deviation. Apparently the Roman added to or altered his buildings to suit his own convenience and requirements. There is little use in

going to the Pompeian examples for evidence of the ordinary arrangements. There, as in our own seaside towns and watering-places, land was very valuable and residents were compelled to make the most of sites with limited areas. There was probably an atrium or uncovered hall in a country house which served for a great many purposes. There had to be dining-rooms and bedrooms, and we cannot suppose that such a proprietor as CICERO could be happy unless he had several exedrae with hemicyclia where he could hold conversations with philosophers and politicians. But it is absurd to imagine that ordinary citizens would demand basilica, bibliotheca and pinacotheca. The villa of PLINY would no doubt serve for a man who claimed to be omniscient and was as ostentatious as the majority of philosophers. It is not, however, to be concluded there were many groups of buildings similarly arranged in the neighbourhood of Rome.

Roman life, it is well to remember, long retained its early simplicity. If ever there was a people who were faithful to the maxim "Early to bed and early to rise," they were the Romans. They were compelled to adopt that course because artificial illumination was in a primitive and imperfect condition among them. Beautiful lamps and candelabra are to be seen in some museums, and lawgivers about art point to them as evidence of the love of form which was general among the warlike Romans. They were very pleasing to look at, but the light the best of them afforded was far inferior to any which can be obtained by a modern workman by putting a penny in the slot. As they could not be expected to sit in the dark all classes tried to sleep when evening approached. Sleep was subject to disturbances; sometimes men were kept awake by the flogging of slaves in adjoining houses, and much of the discontent of the Romans was owing to insomnia. They rose early, but they never found a substantial breakfast awaiting them. War exercised much influence on Roman habits, and a citizen often contented himself with a small portion of bread in the morning in his town or country house, as if he were engaged in a campaign. There might be more than one dining-room in a Roman house, for there was classification of hospitality; but they were rarely used except for one meal in a day, and it was generally arranged for some hour when such work as was necessary had been performed. Neither in town nor country was a Roman gentleman much occupied with domestic affairs. He could meet clients or friends in his atrium. But the business of every day was not so exhausting as ours. A man like PLINY probably was engaged in a number of duties, and it was therefore well that his two villas should be arranged with many rooms. But the ordinary gentleman's house in the country appears to have been much more simple in its planning than an English house.

The people who lived in Rome or in one of the cities, like modern town dwellers, occupied houses which were adapted to their wealth. It is difficult to understand all their domestic arrangements. Where did they lodge the slaves? We can understand a man keeping 10,000 slaves, as is recorded, if his estates extended over a large part of the country. But in Rome it was different. There were, it is true, no regulations enforced like those for modern common lodging-houses, and owners were allowed to keep slaves underground. Yet, with all the laxity, to have 400 slaves attached to a single establishment—for that was the number executed at one time on account of the murder of an owner—suggests an appropriation of a site of which few land agents would approve. Some believe that the Roman houses were carried to a great height, and one Greek orator said that Rome consisted of cities above cities and if it were spread out it would cover the whole of Italy. On this subject, however, it cannot be said that Roman writers all agree, although they have many allusions to the defects of the buildings.

Rome was undoubtedly the centre to which men from all parts of the civilised world gravitated. The

people discovered it was necessary to be there wished to become powerful; and power or office was not only distinction, but enriching oneself to the extent desired. Foreigners found it was a place for the exercise of talent of any kind. A miscellaneous population was collected more for its character than was hitherto found in one place. It was a wide for them the ingenuity of builders was taxed, and the fact that as early as in the time of AUGUSTUS it was necessary to make a law limiting the height of buildings to 70 feet suggests that the national single-storey buildings were out of place within the walls of Rome. Some rooms were likely to be smaller than an attic garrets in London, Paris, or Strasbourg. They must have been constructed of unsuitable material when a fire arose it was difficult to prevent its spreading. Under such circumstances it is not surprising that the old family life fell into disrepute, and that many people were murdered without compunction.

The moral of Mr. WARD FOWLER'S paper is the close connection between population and housing. Artists and archaeologists who prepared views of Rome in which nothing was to be seen but temples and palatial buildings could not have troubled themselves about the problem. They are not to be blamed for this. Many modern cities an inquiry about the places where the poor men live is generally met by a shrug and a shake of the head, as if such information were only a matter of notice of officials and of the police. The proletariat were very numerous, but the great workers did not trouble themselves about where they came from or where they met in public assemblies. Their influence, especially in Rome, was, however, worth taking into account. The same is true of other classes also who are recognised as belonging to higher grades, of whom we have insufficient knowledge. In fact, the mass of the population of Rome was treated as if it consisted mainly of ciphers who were entered in large numbers in tables, but whose lives were beneath the attention of philosophers.

#### THE SOCIETY OF ARCHITECTS.

THE following officers and members of Council for the year 1907-8 were elected at the meeting:—

President: R. F. Vallance, F.R.I.B.A. Vice-President: G. E. Bond, G. A. T. Middleton, A.R.I.B.A. Secretary: Ellis Marsland. Honorary Treasurer: Tucker. Honorary Librarian: R. G. Bare. Members: Henry Adams, M.Inst.C.E., James Bartlett, F.W.C., F.R.I.B.A., J. B. Corby, F.S.I., T. W. Cotman, Milnes Emerson, H. E. Hawker, F.S.I., Cholton, F.R.I.B.A., W. J. Jennings, J.P., F.S.I., Col. F. S. R.E., H. W. Matthews, C. H. Mead, E. J. Scott, F.R.I.B.A., Anthony Scott, W. Scott-Deakin, F.R.I.B.A., J. Fletcher Trew, T. F. Tickner, F.R.I.B.A., Percy B. F.R.I.B.A.

The Bethnal Green Borough Council have accepted the recommendation of Mr. H. T. Hare, the assessor, in the recent competition for municipal buildings, that the authors of design No. 39, Messrs. Percy Robin and W. Alban Jones, of Albion Street, Leeds, and the authors of design No. 65, Messrs. Wills & Anderson, of 24, Abchurch Lane, London, E.C. 4, be placed first and second respectively. There were ninety-seven designs submitted.

The General Board of Studies, Cambridge, will proceed to the appointment of a Reader in Archaeology in succession to Professor Waldstein. The annual stipend is 300*l*. Candidates are requested to send in their applications with such testimonials as they think fit to the Vice-Chancellor on or before Tuesday, November 10th next.

An Extraordinary General Meeting of the property of the Liverpool Royal Institution on Tuesday approved the suggested heads of agreement between the Institution and the Liverpool Corporation with reference to the Collection, and authorised the committee to affix the seal of the Institution to an agreement carrying the same effect. The agreement provides for the loan of the Collection and casts for forty years from September 1, 1908, for care, renovation and insurance being laid on

### DUNSTABLE.\*

DUNSTABLE is situate in the Hundred of Marshead, on the southern border of Bedfordshire, where the ancient Roman road known as Watling Street and the ancient British road known as the Icknield Way intersect. Dunstable was really named after a person, although till quite recently it was taken as meaning "the market place by the hills." It is very probable that there was a small Anglo-Saxon village on the old Roman site called "Duro-brivæ." But the Charter of Henry I., dated 1132, first marks the establishment of Dunstable as a place of some importance in the ecclesiastical and civil history of England. Dunstable is not mentioned in Domesday Book, although very many of the surrounding villages are.

Dunstable is built on a thick stratum of chalk, which is held sufficient to account in great measure for the dryness and healthiness of the place, while the water supply is unusually excellent as regards both quality and quantity.

The existence of this stratum of chalk accounts for the fact that the district has yielded so many well-preserved remains of the various inhabitants in far distant periods. Not only is the glacial period strongly in evidence, but

Dunstable district. Maiden Bower, which we have visited this afternoon, was a Bronze Age camp of considerable importance. It is on an elevation 160 feet above the springs, and entirely without water. Its diameter is about 760 feet, and it encloses more than 10 acres, with a vallum or enclosing earthen bank varying from 16 to 28 feet in width and from 4½ to 10½ feet in height. The chief entrance was the one towards Dunstable, and there are also four others which still remain. Originally there was a dyke or ditch of from 18 to 32 feet in width surrounding the vallum. Excavations have yielded broken bones of the Celtic ox and other Bronze Age animals, all broken for the marrow they once contained, and mixed with chalk rubble, rude British pottery, flint flakes and a flint polishing stone as used in ancient British times for polishing flint axes. In one excavation a perfect human skeleton, extended on its back, with the head to the east, was found.

After the departure of the Romans from the district the Anglo-Saxons invaded it about A.D. 571. During succeeding centuries the place was the scene of constant conflicts between them and the Danes, and it appears very probable that when the messengers of William the Con-

what is of greater importance is the fact that relics of primeval man himself are comparatively abundant.

It is generally held that the Roman station was situated on the west side of the town, because so many remains of the Romans have there been found. And the "Itinerary of Antoninus," a Roman work written in the third century, confirms this view. The spot where the ancient roads intersected was near the end of West Street, and not in the centre of the town. The British road, or Icknield Way, still occupies the original site; but the precursor of the Roman road called Watling Street corresponds with the "Green Way" or "Drovers' Way" near the ancient camp Maiden Bower. The Romans found this road unsuitable, and constructed one which corresponds to that traversing Dunstable from south to north straight through the market-place.

Around Dunstable are to be seen the remains of camps, huts and huts yielding many evidences of the ancient inhabitants of the district, from which history of the greatest importance and interest to the antiquary and archaeologist is deduced. Not far off is the first spot in England where the rude flint tools of primeval man were found, while pieces of Roman pottery, large and small, chiefly of cinerary urns, are to be found all over the

quorum came in 1086 to where Dunstable now is they found the place non-existent. But very soon after the Domesday survey was made we have evidence in the writings of Matthew Paris, the monk of St. Albans, that the miracle play of St. Katherine was presented about A.D. 1115, or some fifteen years or more before the Priory was founded by Henry I. The play represented the conversion and martyrdom of St. Katherine of Alexandria at a feast in A.D. 305. St. Katherine is said to have discarded Jupiter for Christ. For this she was condemned to die on a revolving horizontal wheel, which represented the Sun or Jupiter. After death the wheel was commonly upraised vertically with the martyr's body attached as an offering to Jupiter, but in St. Katherine's case angels are asserted to have descended from heaven, and these by their mere presence caused the wheel to fall to pieces. One version of the story states that the maid was thereupon set free, another that the martyr was beheaded and the body carried by angels to Mount Sinai, where it is still said to be preserved in the Convent of St. Katherine. Such was the plot of the miracle play. In 1880 a twelfth-century seal, engraved with a representation of the martyrdom of St. Katherine, was found near the site of the now vanished choir of the ancient church. The performance either took place in the open air or in a small wooden church which might have been dedicated to St. Katherine—a minor saint—and the dedication changed to St. Peter—one of the greatest of saints—by Henry I. when

\* Read by Mr. A. J. Pitman at a meeting of the Upper Wood Athenæum on October 5.

the new priory church was founded. The documentary evidence of the date of the foundation of the church and monastery of Augustinian canons is scanty. In the "Annales Prioratus de Dunstaplia" it is, however, stated that Henry I. died in the year 1135, and that he founded the priories of Reading, Cirencester and Dunstable. In the charter granted to Dunstable by Henry I. the name of the Bishop of Hereford occurs as one of the witnesses. This bishop was consecrated in 1131, and the date of the founding of the church is believed to have been 1134. The first sentence of the charter of Henry I. states that it was given by the king to the church of "the Blessed Peter at Dunstapel." But it was not till 1213 that the buildings were sufficiently advanced by the Augustinian canons for the dedication of the church. The oldest part of the exterior is the great western portal with the large semicircular arch. It is of Transitional Norman date of about A.D. 1215.

This Transitional Norman work is of the finest class of its date. The fine pointed door of the tower, together with the seven niches above and the fine open gallery of nine open arches extending from the tower to the great portal, belong to the Early English period, 1220-50. In 1903 the gallery was removed and replaced with new work. The niches were designed for figures, but all have been destroyed. The filling of the great doorway, including the

PRIORY GATE, ST. PETER, DUNSTABLE.

square-headed doorway and the semicircular filling above, with the three niches for figures, are Perpendicular work of about A.D. 1450. The belfry, with the upper part of the staircase turret, and the battlement from the tower to the southern turret, are also Perpendicular work. The arcading of one of the arches on the west front is most interesting, as showing the junction of the Norman and Early English masonry. But the present church is a mere fragment of the original. All that is left of the outside is the great semicircular arch and jambs, with a strip on the left. Even the nave is deficient of the eastern bay. The clerestory, the whole of the roof and the aisles, except two bays, have vanished. It is therefore difficult to realise what the ancient building was like. There is not much more than one-third of the length of the original church left. In addition, there can be no doubt that all the buildings belonging to the monastery were in the style of other Augustinian establishments, and included cloisters, cemetery, a dormitory and refectory, an infirmary, school, guest-house, brewery, cellars, kitchens, stables, barns, granaries, storehouses and houses for porters and servants. The guests' hall now forms part of the drawing-room of a private house in the High Street. In the thirteenth century the church was nearly three times its present length and one-third higher than now. It was much darker than at present, as the Norman windows were

small, narrow and filled with painted glass. There were windows in the nave above the arches, as now. The present nave windows represent the open triforium of old, covered with high-pitched aisle roofs.

The northern aisle of the church is modern. The district is not uncommon in the district, is filled in with masonry. After the Reformation, when the sexes were allowed to enter and leave the church together, the north door was very frequently filled up to keep out the cold north wind.

The centre nave is Norman, and dates from 1134-1200 A.D. The eastern end of the nave and the lower columns and arches are the older, the triforium above the nave arches being the newer. The triforium has been filled in with modern imitations of Perpendicular work. The present roof is modern. The lower part of the present east wall represents the choir screen, which separated the people's church from the old choir. It was built up to the roof after the demolition of religious houses. Originally there was a large door behind where the altar now stands, but in the fourteenth century this was filled in and smaller doors right and left of the altar made instead. The niches on either side of and behind the present altar contained figures—that on the south side one of St. Mary that on the north one either of St. John or of the Archangel Gabriel. The centre niche contained a figure of Our Lord. All the figures have been destroyed. When the choir was demolished the rood was destroyed, and the base of the wall built upon to make an eastern wall. The present wooden screen dates from the end of the fourteenth century. The pulpit is modern, and the font is an imitation of a Norman one which existed prior to 1850. Over the altar there was at one time a fine large picture of "The Last Supper" by Sir James Thornhill. The brasses have been kept loose, and like the church registers are well worth examination. What is said to have been the old sanctus bell is used as a fire bell, and unfortunately it must be confessed that in the past sufficient care was not taken of the carvings, figures, canopies and many other things which one time existed, to prevent their being scattered east and west, north and south, to be used for any purpose other than that for which they were intended. The vestry is separated from the chancel by a wooden screen surmounted by columns of unusual archæological interest and of great excellence. These symbolical carvings are works of the reign of Queen Mary, and fortunately a number of them have been preserved. It is surmised that Queen Mary had these carvings made for the decoration of a chapel, to replace the lady chapel in which Archbishop Cranmer pronounced the sentence of divorce of the marriage of Henry VIII. and Queen Katherine, declaring at the same time that Mary was base-born and illegitimate. It is supposed that the western doors were those to which the decree of divorce was actually affixed. The Fayrey window, belonging to the Flemish school of art is of fifteenth-century date. It is said to have been given to the Fraternity of St. John the Baptist at Dunstable by Henry Fayrey, who died in 1516. After many vicissitudes of fortune it has been restored to the church again. The centre part of the window is rich old Florentine brocaded velvet. The figure subject and arms are of the highest excellence, both as regards drawing and execution. In the market-place once stood a lofty cross in honour of Queen Eleanor, wife of Edward I., whose dead body rested one night before the high altar of the priory church when on its way from Lincoln to Westminster. But not a fragment of it now remains.

The town hall, situate in the centre of the town, contains photographs, transcriptions and translations of the earlier charters of the town given by Henry I. and Henry III., as well as many other things of great local interest.

Adjoining the town hall is a semicircular archway with Doric columns and mullioned windows above, and probably belonging to the latter part of the sixteenth century.

It would not be right to bring this paper to a close without mentioning the industry for which Dunstable and the district is celebrated, viz. that of straw plaiting, and, secondly, acknowledging my indebtedness for information here brought together to Mr. J. Worthington G. Smith, the local historian, antiquary and archæologist who has done so much to secure that the history and surroundings of Dunstable should take that position in British topography which they so richly deserve.

The British Museum Reading-Room will be reopened for readers on Friday, November 1.

## WINCHESTER CATHEDRAL.

IN a letter to the *Times*, Mr. T. G. Jackson explains the work required at Winchester Cathedral:—

The site on which the cathedral stands, he says, is at the foot of the declivity that falls to the valley of the Itchen. In primeval days the bottom of the valley was a bog, and when in the eleventh century Bishop Walkelyn began to build, it was covered with a layer of peat 7 feet thick, on which rested a bed of chalky marl, washed down from the surrounding elevation. The Norman church was built on the edge of this soft ground. Coming to water at a depth of about 10 feet, the builders were unable to go further, and they drove in some short and ineffectual piles of oak, on which they laid their foundation. It is curious that none of these piles have been used before, and contain no carvings, being, no doubt, relics of old Saxon buildings. These foundations have yielded to the weight placed on them, but not so badly as what follows.

When at the end of the twelfth century Bishop Godfrey de Lucy built the presbytery and the first bay of the lady chapel, the builders had to advance further into the bog than Bishop Walkelyn had done. Coming, like their predecessors, to about 10 feet below the surface, just when they reached the bed of marly chalk mentioned above, they were at a non-plus, and, as the best they could do, they cut down a wood of great beech trees, laid them flat, and on them Bishop de Lucy raised that building which is one of the gems of early English art.

I have no doubt that the trouble which followed, and which has nearly brought this part of the building to ruin, began as soon as it was built. The tree trunks did not rot away, but they were pressed down into the soft ground as much as 2 feet 3 inches; the vaults became disturbed and cracked, the walls out, and the whole building split off from the Norman part west of it and slid eastwards, leaving gaping cracks at the point of separation and in several other places. The dislocation of the vaults was so great that the curves which should have been concave became convex, the arch construction was lost, and they would have fallen long ago but for the iron bolts and straps by which they were hung up to the roof.

This was the situation when I was called in to undertake the repair. The foundation being mainly in fault the obvious remedy was to underpin the walls on the compact level that underlies the peat at a depth of 16 feet. And here the difficulty of the water which lies at the level of 10 feet or 10 feet below the surface presented itself. I am indebted to my friend Mr. Francis Fox, the famous engineer, for the suggestion to employ divers, of whose services he has availed himself in underpinning bridges and other works of pure engineering, which lie beyond the ordinary experience of an architect. This plan has answered perfectly. The greater part of the lady chapel and the presbytery now rests on a solid rock of cement concrete, which itself bears on the hard gravel bed; the vaulting has been repaired and the ribs are restored to their shape; the walls have been grouted with cement and strengthened, and it is probable that this part of the church will be cleared of scaffolding and restored to use by the end of the year.

The condition of the Norman transepts and the choir piers next invited attention. The latter are now being underpinned like the presbytery, but the transepts present greater difficulties. Partly owing to bad foundation, partly perhaps to injury when the Norman tower fell, as Norman towers often did, soon after it was built, by which the adjoining arches and walls would be forced outwards, the gables of the transepts overhang the base, that of the north transept as much as 4 feet, and the side walls are shattered and dislocated to an alarming extent. Daylight could be seen through the fissures in the north transept, and into one corner of that part no less than 25 tons of fluid cement have been injected. Both transepts need underpinning and tying back by an elaborate system of iron rods and cramps. They are now being shored to prevent disaster, and here for the present the works must stop till funds come in to enable us to proceed.

Were the dangerous condition of the cathedral more generally known, I cannot believe that it would be left for ages leaning on crutches. In our great English cathedrals we have an inestimable heritage from our forefathers, not only monuments of their piety, but treasures of art which may well challenge comparison with those of any country. It is for us to preserve them for those who come after. The sum of £60,000, for which the Dean asks is not much more than the sum given not so long ago for a single picture; and who

would maintain that if Velasquez's "Venus and Cupid" had found a home at Berlin instead of at Trafalgar Square the national loss would be comparable to that involved in the ruin of a cathedral which stands pre-eminently in the foremost ranks of those of which Englishmen are justly proud?

## THE PAINTER'S ART.

A LECTURE on the "Penalties and Pleasures of Painting" was given in Northampton by Mr. Alfred East, A.R.A., P.R.B.A. He said the arts might be said to cover the whole range of human expression. They could express their admiration of the beautiful by words, colour or sound. One artist might have a different field to another, and in this respect literature stood in a very special and distinctive position, for it used its own art, that of words, not only to explain itself but to explain and criticise the position and attributes of the others. It had, however, a more limited appeal than painting, for without the medium of a translator it was only available for the particular country of its language. On the other hand, they could not paint a criticism or the explanation of painting, and there were qualities in painting that could not be expressed by the finest writing. Painting would not have grown into the position it now held had it not contained some distinct charm, some quality that could not be expressed by any other means than its own. That was the reason of its existence. Otherwise it had no object to serve. Most people would not go so far as to say there was no real use for fine art in everyday life. If it served no other purpose than to arouse an interest in the beauties of nature it was no mean thing to accomplish. As a means of representing a landscape or figure, poetry was inferior to painting, but as a means of representing action and the working of the human mind in action poetry was superior to painting. In these days he feared there was not sufficient regard paid to the question—What is the true mission of art? The painter was constantly trespassing on the domain of literature, and the literary man upon the province of the painter. Selection was necessary in all the arts. One might start to write down an impression, but, after many attempts, might discover that the subject was not one for words, and that it could only be expressed by painting. There were things in life that could only be described by the one or the other. The arts were one in the sense that they all expressed the ideal, but were divergent, inasmuch as they expressed different attributes of the ideal. Landscape-painting was an independent form of human expression. In early times it was merely the accessory of the figure or historical painter. It was not until comparatively modern times that it dawned upon men that it was worthy of an independent existence. After discussing the works of various artists in this direction, the President spoke of the need of a thorough knowledge and mastery of technique.

## BIRMINGHAM COUNCIL HOUSE.

THE Birmingham City Council at their meeting on Tuesday adopted a report by the general purposes committee which stated that, having effected certain modifications in the accepted design for the Council House extension, in consultation with the architects and with the committees concerned, they have appointed Mr. Hugh Watkins, of Gray's Inn, London, and Mr. Anthony Rowse, of Birmingham, joint quantity surveyors on the usual terms. In order to save time and to enable the excavation for the new building to be carried out during the coming winter, it is proposed to let the contract in the first place for the excavations, foundations and the lower ground floor only. In the instructions to architects for the purpose of the competition it was stated that the cost of the building must not exceed 150,000*l.*, and that their plans must be capable of being carried out at that cost. In making their award Sir Aston Webb and Mr. Ingress Bell stated that they had no doubt the plans of Messrs. Ashley & Newman could be carried out for the amount named. The committee recommend that the finance committee be instructed to borrow the sum of 150,000*l.* for the purposes of the building. The committee will then proceed to obtain tenders for the first portion of the work, and report their recommendations thereon in accordance with the instructions of the Council.

The Irish Board of Works have agreed to use Irish limestone for four-fifths of the masonry of the College of Science, Dublin. The remaining fifth will probably be Portland stone.

## NOTES AND COMMENTS.

THE session of the Royal Institute of British Architects will commence on November 4, when Mr. T. E. COLLICUTT, president, will deliver an address. The following papers will be read at succeeding meetings:—November 18, "The Present Condition of St. Paul's Cathedral," by Mr. MERVYN MACARTNEY. December 16, "Means of Escape from Fire in Modern Factories and Warehouse Buildings, with reference to the London Building Acts Amendment Act," by Mr. WM. WOODWARD. January 20, 1908, "Royal Palaces in Scotland," by Mr. W. T. OLDRIEVE, F.S.A. Scot. February 3, Address to students by the President and presentation of prizes. February 17, "Foundations, the Use of Divers and the Grouting Machine," by Mr. FRANCIS FOX. March 16, "A Modern Asylum: Bangour Village, near Edinburgh," by Mr. HIPPOLYTE J. BLANC. March 30, "Theatre Planning." April 13, "The Designs for the London County Hall." May 16, "London Bridges," by Professor BERESFORD PITE.

THE power of a local custom in building was exemplified in a case heard at the Stalybridge Police Court during the week. A bricklayer claimed 10d. for an hour's wages from Messrs. PARKINSON & SONS, contractors, of Blackpool. It appeared that a foreman used language to the plaintiff which he considered offensive, and he at once abandoned his work without giving notice. His employers, who had to observe the custom of giving notice to their men, retained 10d. The Operative Bricksetters' Association took up the case. It was stated to be the local custom for bricklayers in the Manchester district to leave work without notice, either of a give or take character, and this system had always prevailed. At Bolton the men gave an hour, at Newcastle two hours and at South Shields nine hours, but it was only custom. A number of bricksetters, along with the local secretary of the association, gave evidence as to custom. The Bench decided that local conditions and custom must prevail in the absence of a contract as between man and master, and judgment was given for plaintiff with costs.

THE difficulty of the construction of a lighthouse in the position where one is most needed is suggested by an effort which is now in progress on the French coast near Ushant. There is a dangerous reef known as Ar-Gazeck, against which many vessels have foundered. The late EUGÈNE POTRON bequeathed 16,000*l.* towards the expense of erecting a lighthouse on the rock. The Government undertook the commission, but owing to the violence of the currents the progress is slow. In 1904 the preparation of foundations could only be attempted during fifty-two hours, in 1905 the works were carried on during 206 hours, while last year operations could be continued only for 152 hours. In other words, during three years there were only fifty-one working days of eight hours. It is considered the lighthouse cannot be completed under four more years.

WHATEVER advantages may arise from the separation of Church and State in France, there can be no question of the danger to works of art in churches which it has created. Long before the rupture crafty agents were at work endeavouring to secure treasures by adoption of the principle of the magician in "Aladdin," of offering new lamps for old. Brilliant works from the manufactories about St. Sulpice in Paris were offered by men posing as generous benefactors in exchange for the dingy pictures and sculpture which appeared so unsuited to an advanced age. Simple-minded curés were ensnared. But the recent legislation facilitated exchanges, for the clergy could not accept the theory that the antique works in their churches suddenly became the property of their enemies. The revelations at the inquiries in Clermont-Ferrand and Limoges are enough

to prove how systematic are the efforts which were made of late to obtain property from churches, not only painting and sculpture but metalwork, embroidery and any kind of ancient art which was of value was taken and resold without difficulty. Several precious examples are, it is said, in London. One of the culprits used paper for correspondence which was an imitation of what was employed by the bishops for official letters. In that way the clergy were duped. One chalice taken by the Clermont-Ferrand gang is valued at 120,000 francs and a reliquary at 100,000 francs. Among the seizures by the police was a collection of photographs of shrines, church plate, tapestries which were stolen from French churches during late years. Politicians may be indifferent to the fate of the ornaments, but a system which encourages robbery cannot be an advantageous or desirable result of the operations of a Government.

WHEN the great basilica of the Sacré Cœur commenced at Montmartre the people believed that it was intended to supersede the strange old church of St. Pierre with its curious tower, which seemed to belong to some ancient windmill. The church itself was without any unity, and a visitor could not help wondering how so extraordinary a combination became possible. The building was allowed to fall into decay and it was proposed to treat it as a dangerous structure. But a church which has a history goes back to the time of St. BERNARD and PETER VENERABLE deserved to be respected. Owing to remonstrances the Commission of Historic Buildings took possession of the church, and it is needless to say that in consequence it was restored. The architect was M. SAUVAGEOT, and it is believed that the outlay must have amounted to 12,000*l.* Two of the columns are supposed to have belonged to the pagan temple which stood on the site. Churches are no longer regarded with the reverence at one time general in France, and probably it would have been preferred that the restored church were utilised for some secular purpose. But diplomacy has succeeded in retaining the church for ecclesiastical use, for which, all things considered, it is best adapted.

## ILLUSTRATIONS.

DESIGN FOR NEW COUNTY HALL, LONDON.

THE main idea of this design is to so open up the areas that sun and air should have free access to the interior. This has been done by placing an open colonnade on the river front between the main block and the embankment. The plan is axial and symmetrical, with the council chamber entrance from Westminster Bridge Road, where there is provided a grand staircase leading to the principal floor. The council chamber is placed in the centre of one of the two large quadrangles, and the county hall in the other on the same floor, so that it would be available for receptions, &c., *en suite* with the councilors' and committee-rooms. In the centre of the block is placed an entrance hall accessible from Belvedere Road and the Embankment; it contains the main staircases and groups of lifts, which serve as the centre of the main corridors in each floor. For additional office entrances are provided, one at each corner of the building, all intercommunicating by means of wide corridors. The design of the façades grows naturally out of the plan, the principal feature being the domed roofs of the two halls seen in varying perspective through the colonnade from the other side of the river. The treatment of the embankment is of a simple character, suitable for granite, relieved by pylons and steps to the water in the centre. The design is by Messrs. NICOL & NICOL, of Birmingham.

GROSVENOR RESTAURANT, GLASGOW.

TURNBERRY HOTEL, AYRSHIRE, N.B.

ETING of the Association was held on Friday evening last in the premises at Tufton Street, West-Mr. Walter Cave, president, in the chair. Council's report and balance sheet for last session

PRESIDENT formally acknowledged the acceptance of the new colour drawing by Mr. A. W. Weedon, R.I., and to the Association by old pupils of the water-colour class. A vote of thanks was accorded to Mr. W. G. B. for his energy in promoting the gift.

following gentlemen were elected members :—  
 W. Simon, Liverpool ; J. H. Wallace, Brunswick  
 W.C. ; E. R. Green, Queen Square, W.C. ; H. S.  
 ugby ; B. Hughes, Woldingham ; A. B. Knapp-

MALSEY RICARDO read a paper entitled

### Sentiment in Architecture.

id : In considering the quantity of communicable  
hat can be and is expressed by architecture, one has  
guish first the poet—the maker—and view his  
as exhibited in his materials and his synthesis of  
d then to consider the result, not only as an  
n of his own feelings, but of the far greater and  
ious manifestation of the prevailing feeling of the  
nd then there is his counterpart, the spectator, who  
ssed first by the individual expression as something  
nd personal, and then, further, by its voicing the  
unexpressed feeling that is common to all artists of

He represents, so far as he is recipient and not the dumb aspirations of his age, and the artist whom he vibrates in sympathy with the note struck by the age. The existence of this audience, its strangeness, its strength and its depth, the fluctuation of its moods and its actions, which appear to exist apart from and largely independent of the usual economic conditions that have to account for so many of men's actions, suggest a condition of existence which I can, I think, best shadow forth as a manifestation of a power of which our qualities are beyond our determination, whose possibilities are beyond our apprehension—as so many things in the world do—of which we can see but the fringe and the edge, but of whose power and of whose mystery we have an almost frightened recognition.

member as a boy the angry denunciation by my  
sentiment as a factor in life; and the violence of  
denunciation was a tribute to the recognised strength  
of emotion and to their inability to understand and cope

That it existed, that it was an impulse ready and invade and confound the established formulæ of it was an adverse and irreconcilable ingredient, admitted, was their hostile conviction; they knew that not be wholly excluded, and they attempted to the areas in which it might display itself. "Avoid it," was the universal cry. "For goodness' sake, get it out of your business relations." "Remembrance has no part in the practical relations of life."—like grit between the cogs of some elaborated mechanism—it was an interpolation of a foreign element and throw the whole machine out of gear—and yet while they dimly saw that this sentiment at bottom

was really the controlling power, and also at top the final court of appeal and the regulator of the standard of the product.

This antagonism to sentiment flourished most in the central years of the nineteenth century, when the hope was that men's relations to each other could be regulated mechanically and arithmetically, and amidst such an artificial and delicate equilibrium sentiment was an unwelcome and unmanageable intruder. Another view of life, another reading of history, has followed on the breakdown of this unnatural exposition of human life, and we recognise now that sentiment pervades and underlies all human action—in varying quality and varying degree, doubtless—but it is the strongest impulse that we know of and omnipresent. We may call it the fourth dimension of sentient matter, or rather, to account for it seems to presuppose a fourth dimension of space. It has to us some of the unquestioned but inexplicable qualities that beings of two dimensions would experience living in a world of three dimensions.

Let us, without being too severely consistent, imagine a colony of two-dimensioned beings dwelling upon a solid plane—like the top of a table—with air or space above them. Of the thickness of the table top they could form no clear idea, but they would be conscious of thrills and vibrations that occasionally pulsed through its fibres. They could not see, but they could hear and feel—their actual knowledge of each other could only be got by contact with the edges of each other—but they would be conscious from time to time of movements in the atmosphere above them, of its changes in the matter of temperature and moistness, and indeed much of their movements and their attitudes to each other would be caused and determined by the gusts of wind that swept them about on the table top where they lived. Why these gusts came they could not explain, nor what caused them, and consequently they could not predict or anticipate their arrival; but they would be conscious of the increased pressure and heat upon them—they would find themselves every now and then swept in one stream, or in detachments to different parts of the table top; they would undergo various modifications of shape owing to their being squeezed together or driven apart, and the topmost one of these superficiais, blown in front or a little ahead of the others, would be named by them as a “genius,” the pioneer of the route along which all or the foremost were travelling. After the gust had passed there would be what we should call the anticyclone and then the reaction. But during its passing the table top would get heated, which would quicken the activity of these counters, and all who were located in these districts would share in this stimulated movement. For the most part the superficiais would ascribe their animation, its ebbs and flows, to their own organisation: they would explain that they had the control of their own movements, that they modified their shapes voluntarily, and that external influences (if there were such things) had very little effect upon them. Their social conventions, their view of life, took no account of the table beneath them, nor of the air above them, except in the bare inexplicable fact.

But a spectator of the normal three dimensions, looking on at this colony, would see at once that it was just these facts, of the table and the air with its disturbing influences, which the counters tried to eliminate from their daily actions, that did matter. What they could do of their own volition, either as individuals or in company, was so trifling compared to what a puff of wind could do; what they did themselves seemed so arbitrary, so discordant, so full of compromise and hesitation, compared to the prompt unanimity that a gust of wind at once brought about; indeed, deny it as they would and ignore it as they could, that was really the mainspring of their movements. Any moment their relations to each other and their schemes for future movements could be overthrown completely by this inexplicable force. As a rule, they found from experience it was not sudden; there was generally a slow crescendo leading to the climax, and then usually a smart drop, followed by some secondary puffs of diminishing intensity; but in their history there were records of storms that arose almost on the instant, and raged with unparalleled violence.

Let us take the early Crusades as an instance of a sudden enthusiasm which transcended all the conditions and habits of life at that period, an enthusiasm which at the voicing of Peter the Hermit inflamed the whole of Europe, impelling enormous numbers of men, women and children to throw up all they had, leave the land in which they were born and the relations that were dear to them, and to set forth, unarmed, without provisions, without any thought

for the future as regarded their bodily needs in the unknown, far-off, mysterious land over sea, to encounter the Paynim and the Infidel. How can we explain this wild abandonment of the precepts and exigencies of normal life? What causes can we give that are adequate for this vehement enthusiasm? It shook both high and low. The king and the serf were both passionate to set foot on the Holy Land.

Again, what political, economic, or social theories can explain the pitch of intense universality that art rose to in the thirteenth century? Not only was art conspicuous by its excellence throughout Europe and even in the East at this particular period, but it pervaded all the apparatus of life. The bench, the joint stool, the bow and arrows were as much things of beauty as were the furniture and upholstery in the cathedrals and palaces. The idle chorister boy at his desk and the prisoner in the twilight of the dungeon left their names for posterity to indulge with pity or with blame; but also (though this was never in their thoughts) for admiration at the beauty so simple a piece of sculpture under such hard conditions could possess. Even if one tries to explain it by the slow preparation of the preceding centuries—which is somewhat in the nature of explaining how the elephant that bears the world is sustained by the tortoise—how shall one account for its sudden collapse? That the various arts, formerly associated together and practising more as crafts, should by this time have reached such a pitch of excellence that they should strive to specialise, to uplift their craft into independent effort, and so become developed out of their surroundings into separate exhibitions of technical dexterity, provides only a partial explanation. The impulse should have been strong enough to produce these offshoots and yet still continue its growth. What made Greek art perish so rapidly? How is it that Persian art endures to this day and yet is probably the oldest art of all that we know? We cannot answer this any more than we can say how or why the world is here. We are as ignorant of the real causes of these waves of emotional action as were the counters on the table we have just been considering. They appear to be outside of our control, to be much greater than ourselves, and to be forces that sway nations and sometimes groups of nations homogeneously: the actual expression may come from a single individual—to take the "Retraction" of Kipling for an example—but it is the outburst of a sentiment that is pervading all people's minds at the moment. And the expression once enunciated, either in poetry, music, painting, sculpture or architecture, becomes codified: it enters into part of our constitution and posterity's—we are never quite the same people again. As the wind swept the counters, huddling them over to some fresh part of the table, the counters found their shapes somewhat altered owing to the pressure and the action of their transit. Partly they recovered their old shape after the pressure was gone by, but some modifications ensued, some sensitive interlockings forming new sensations of contact renewable every time the particular juxtaposition occurred. So that we are able to respond to the passions of a time long gone and to appreciate a sentiment which still remains like the fragrance of a plant whose growth has long since ceased.

Take, as a crude instance, the oxen who peep out of the corner pinnacles of the steeples at Laon. Up the steep acropolis their living representatives dragged, 600 years ago, the blocks of stone that were to constitute the cathedral; and the memory of their patient service has been recorded in this way. This simple recognition of gratitude to the dumb labour of our beasts of burden is a cry from human heart to fellow heart, audible still through the centuries. The crosses that Edward I. set up at the places where his wife's bier rested on its last journey home are another instance of the direct exhibition of sentiment—in masonry, but of individual sentiment mainly. Doubtless all England was proud of her king and sorry for him in the darkest hours of his life, but the feeling of the nation, though sympathetic, was hardly of itself strong enough to crystallise out in monumental building. A more conspicuous instance of sentiment mainly individualistic and expressed directly without the usual attributes and adjuncts given as explanation, was the old Newgate Prison, where the necessary inhumanity of imprisonment was portrayed by windowless walls and immovable masses of stone. Behind those blind, deaf, blank walls hope died—the building was brother to the grave, and the terrible kinship used to be publicly demonstrated. But sentiment in architecture is generally of a more subtle character, and can be discerned more easily

by taking epochs and nationalities rather than by buildings.

Thus we can say of Assyrian architecture (as the sculpture that has survived) that it is kin to the architecture, overawed somewhat by the terrors of the formation of the cities' enclosures, the terraces, their immense cultivated spaces so guarded, seen that the people themselves were unwilling soldiers, their kings enjoyed the best of life alternately in the chase. It was necessary then to exact the support of the inhabitants of the city for the throne in defiance of the natural inclinations of the populace, and this was achieved architecturally, by withdrawing the palace into the town, by having the temple and the watch tower pointed far into the night for the star-gazer priest to read the dread scroll of the firmament, adjacent and so close to the king's hall, by making hall retire within hall, by stair passages planned on the noblest scale, by statues of the most terribly impressive—colossal animals eloquent in their inscriptions, crouching lions to carry the supports of the king's halls, and the use of colour symbolical of the gods. For the kings it must have been a stirring time, a time of more practical activity and purpose in the architecture of Mesopotamia than there is in Egypt. There is a feeling in it of a kind of romantic quest to discover the quietude that shall atone for the servitude of life, the priests' architecture in the land through which the winds flow—the temples with their avenues of sphinxes, pylons, obelisks and the dark heart of the temple itself, pierced on solemn occasions by the rays of the rising sun, or palpitating under the radiance of the evening star. But the big gods, for the most part, seem to speak of the great justice of the world to come—the inevitableness of labour in the orderly march of the seasons and the great power of earth and sky. Besides this one discerns a strong sympathy with and love for the smaller domestic and the pleasure of portraying them as almost human, accepting them as of near kinship with ourselves.

The architecture of the Greeks, judging by their temples and the few other memorials left in Attica, Sicily, the coast of Asia Minor, is sculptors' architecture—is sculpture. The masonry, the columns, the pediment, the entablature are all so much fine chiselled work—the material could not be the marble which they used, was the proper one, it was crusted over with a thin layer of stucco, moulded and carved to pass for the real thing. A little now is left of the colour that played so important a part in the complete effect that it is hard to visualise these bleached bones must have looked like when they were on them, and we approach these masterpieces of technique and subtle sense of beauty with a sophisticated and clouded eye for some centuries past. Phidias, I could not contemplate the present state of the Parthenon, part of the general fate of all things fashioned by human hands, but what he wouldn't be able to understand in the British Museum outside or in. That we should so neglect to collect, preserve and restore the sculptured fragments of that day, attempt to reproduce their setting and exhibit them once stood in their framework of Greek architecture, then to stop short at the last moment and omit the ornament that vitalised the whole inert mass, to forego the use of colour, would be inexplicable to him. On our side, habituated as we are, and have been for the last 40 years to the contemplation of Classic sculpture as so much wrought out of white marble and to be admired only, that it seems sheer profanation to even think of statues and their architectural surroundings as glowing with colour. Under these crippled conditions it is hard to estimate past the inscrutable mastery of Greek workmanship to win from these cold masks the story their fashioners intended to tell. An Englishman prides himself on his turn of mind, his horses, harness and carriage, and his pride is that he be unobtrusive, honest and finished to the last detail of the very best. There is little ornament on the carriage, beyond the crest in silver, the carriage is painted in various colours, the horses are matched in size and general colour; he desires a sober harmony and anything that is avoided, but everything that there is is excellent workmanship. So of his house, his cellar and his garden. He is something of this demand for perfect finish in Greek art, but without the moral sense that the Englishman has for exact workmanship. The Greek delighted in the evidence of his loyalty in his contribution towards the monument that was being raised; the Englishman in the perfection of finish as evidence of the honesty

and conscientiousness of the craftsman. Even in the state of Greek architecture one can perceive the sense of a tense equilibrium—an intellectual sense of balance rather than the artist's—an attempt to overpass the limits of their material.

Just as the Greeks were refiners, the Romans were concerned with the mechanics of building and the minutiae of the trimmings and haberdashery with which they made their Greek and Greek-taught craftsmen erect their great erections. But they had a bourgeois taste for profusion; conquerors of the world this side and that, they brought to Rome all that the world held precious; masters of many nations and countless numbers of cities, they projected buildings without the fear of the future before their eyes, buildings grandiose, colossal, and mostly overdecorated. The whirligig of fortune brought its revenges; the buildings of the Roman Empire have been dismantled of their costly plating, and for their material, treated as a quarry by the Romans and the lime-burner; the marbles that came from the East, from Asia, from Numidia have been wrenched from their setting and established in buildings throughout the Empire of quite alien feeling and purpose, and we owe to the imagination of a second-class watering-place, shoddily and after partial destruction from an earthquake and only preserved in cinder ash, our chief knowledge of the Romans of the Empire lived—so far as the objects can tell us. We know from the few objects left, and by dint of intelligent excavation, that a broad scale their public buildings and were planned, and we can get some idea of the use of marbles and colour by entering some of the best erected restaurants and the buildings of various cities and societies. Rome was a place that if you had your pocket or some influence, say, with the censor, well enough place to live in, but it must have been a place for the poor man and the slave. Roman architecture is sheer materialism—there is no hope in it, no sense of any spiritual ideal. No wonder then the religion, with its Gospel addressed especially to the poor and the oppressed, took such sudden and wide-spread hold under the Roman régime; it was the complete answer to the doctrines current and practised in the

old Rome came the architecture of the new Rome—Constantine and the exarchate of Ravenna. The mysticism of the East, the passionate monotheism of the Hebrews, the metaphysical subtleties of the Christian religion, the imagery and superstition of the Greek mind, all came into the miraculous earth-bubble of St. Sophia. With allegory, every detail significant of some doctrine, every ornament a symbol as well as an element of service, the great dome and the lesser domes in their hollows the chorale of the Christian faith. Every church under Byzantine influence tried to be the temple of the world to come. The church, too, was a bulwark against the hostile powers that were in the under-world—the great powers of magic and of evil—and the great canopy that dwelt quietly over the haven of the symbolised safety from the malice of man and devil. While the northern nations were forming their own faith, what their church should be, based on the actual facts that they found on the soil they invaded, and coloured largely by an innate hostility against the languid faith of the southern folk. There is the keen aggressive spirit of the East wind amongst these people: they fought for religion, and personal emulation was a prime factor in their lives; to read of the encounters of the Goths against the Romans is to read romance; each Paladin attempts to slay more desperate single-handed against the invincible phalanx than his slain comrade beside him; it is a magnificent "showing off." They fought for the devilry of distinction, for plunder; they were of the breed of warriors and pirates, men of humour, poetry and swift decision. A splendid ideal swept them off their feet; and deaf to what might be the impracticabilities of the world, they held life lightly so long as honour was preserved. These qualities in their work until the time of conquest came, when the Normans settled down to batten on the rich lands of England, Sicily and South Italy. There was defiance of mere building limitations in the way they laid out their cathedrals in England. That they went so high and too wide to roof did not trouble these builders; that their columns and piers were disproportionately bulky for the work they had to do was of no concern to them than the way they measured their

gifts; whilst the carved enrichments, the reminiscences of the sculptured embroidery that they had seen abroad, give in a halting, technically imperfect and primitive way a playful outlook on the objects around them. The fun is massive and apt to be overcharged, like a blow from a lion's cub whose paws are out of proportion, large and heavy; but in early Gothic work there are smiles and tears and a feeling growing up that whilst God's justice is not to be doubted, it is not so easy to enter Heaven as their fathers thought.

Whilst knights were scouring singly the country in quest of adventure, the industrial population was collecting itself into groups, independent of the baron and independent of the Church. These guilds made themselves strong enough to exact terms, charters and privileges from their feudal lords, and we can dissociate the sentiment in their buildings—that of progress, of outshining their rivals, of wringing from their materials the last ounce of utmost—from the timid ostentation of the chantry where the magnate was to repose and to have his doom nicely proportioned to his lineage, his conduct, and the money spent in prayer to his assessors.

One might go on, age by age, attempting to appraise the characteristic sentiment of each time—how in England the home and orderly surroundings began to emerge in opposition to the castle and the predatory excursions of the baron's feudal retainers, how after the days of Richard III. the home and the castle proceeded to amalgamate, and the revival of letters, helped by the printing press, showed the aristocracy that there were other modes of gaining distinction besides personal bravery in contest—especially since the use of gunpowder in warfare tended to eliminate the personal element and to advance the value of well-disciplined, concerted action. The nobles merged their showy bravery into theatrical entertainments, and pageantry, and the Renaissance movement lent itself readily to the enlarged scale of reception-rooms and to the investigation of the grandiose days of the Roman Empire. The personal note of the architect appears; literary culture concerned itself more with the history of heroes and individuals than with peoples; the arts had already begun to distinguish themselves from the crafts, and had assumed a superiority which was exercised in directing and dominating the latter, till we get a complete divorce between the artist and the artificer and a standard of execution that is largely gauged by antiquarian knowledge—scholars' architecture appears. Louis XIV. would be a Roman emperor, and he lays out his palace and park at Versailles in a way and on a scale to eclipse the works of Trajan.

The polite man of letters—like Lord Chesterfield—affected the carriage of a pro-consul, consulted his Vitruvius, was concerned over the architectonic equilibrium of his house and its appurtenances: the kitchen wing balanced the stable wing, and anything that was disorderly or derogatory to the trim decorum of the elevation was kept in the side enclosures and screened by a high wall. Scholarship by-and-by stiffened into pedantry in architecture, and towards the end of the eighteenth century the whole train of thought, political, social and economic, grew into rebellion against the rigid formalism of the time. In architecture the outburst showed itself in the Gothic revival: the cold-hearted canons of correctness were replaced by other canons of equally desired correctness, but besides there was the Crusader's fervour. But he was a knight errant with no squires to support him; the workmen understood nothing of the quest, could do nothing to help him, could merely carry out passively his directions, given in writing. You may put the clock back and still register the time—the early Renaissance folk did that—provided the works are in order and going, but this was a case of setting back the hands of a stopped clock and pulling at the weights yourself.

But the consequences of this outburst of generous passion, though they failed in the particular direction where their efforts were expected to show and progress, were not lost. They took the shape of a larger humanity, of the responsibility of man to his fellows in other aspects besides those of crime and disease, resulting in the erection of schools of all sorts, public libraries, public halls and galleries. Moreover, the treatment of disease and infirmity (owing to the development of medical knowledge and surgery) took on a more humane aspect, and this sentiment of pity for the weak is expressing itself in our hospitals, infirmaries and asylums. At present our attitude is to deal with the sheer bones of the question and determine them, with some principal muscular attachments: the

flesh clothing is to come when we are more experienced and consequently more able to provide it. But for the moment, so far as we can manage it, we will allow no one to start on life's race handicapped by ignorance, nor shall he be crushed against the wall owing to disablement by weakness and pain. The Board schools form a handy illustration of this sentiment; they form the structural summary of the many problems and researches into educational ideals and systems that have been occupying the minds of our serious thinkers on this question; they arise in direct answer to the conditions formulated for the students' requirements and welfare, embodying the conclusions of a large body of experienced men, and they constitute, perhaps, the most significant and most interesting class of buildings that have been erected in our time. They had the advantage of starting without any too restrictive precedents—which enables them to state their purpose in simple direct terms—and they constitute a record of the thought of the latter half of the nineteenth century on the responsibility of man to man in the matter of education. It is not individual thought; the feeling is as widespread as ever was the enthusiasm for the release of the Holy Land from the grasp of the Infidel, and the architectural value of these buildings is in direct ratio to the intensity and humanity of the thought.

The idea—now rising to the surface again—that we should treat our cities, architecturally, as one large unit instead of a collection of separate individualities, with definite architectonic arrangements of roads and spaces, consulting the welfare and æsthetic contentment of the community instead of the private interests of each landholder—this idea carried out at once gives scope for dignified architectural treatment. That citizens should live side by side with each other in mutual forbearance and co-operative unity gives the distinction to the Park front of Carlton Terrace and to the various terraces that flank the Regent's Park. Unfortunately, whilst we are scheming projects in this direction, we are actually destroying many of the examples of this sentiment left to us by our forefathers. The architectural conception and unity of Waterloo Place, of Stratford Place, of nearly all our squares, of Regent Street, have been broken into and destroyed to meet modern exigencies, and the new buildings that grow up on the ruins form no part of a future concerted scheme.

We live in the days of a tolerant, kindly sentiment towards our fellow men, but this is no stuff to raise fine architectural conceptions. We live in times of security to person and property: the great work of the past was done under quite different conditions. Except in the matter of income, social distinctions and even national distinctions are becoming fainter and more equalised; it was not so in the thirteenth century nor the many centuries before and after. Our sensations are subject to a fatty degeneration brought about by security and, to most of us, ease. No sword-point at the breast tries our fidelity, no oppressor, not even the tax-collector, grinds our misery down to the breaking point—besides the sanctuary of our home there is the sanctuary of the Law Courts, and with the removal of fear has gone in great measure the attribute of reverence. We have reached the nirvana that years ago the middle class in a prosperous Roman colony attained, say, at Verona or in Provence; but they had it only for a short while, and ever in the North and East hung the black cloud of barbarian invasion: a background for the most part a mere matter of storm cloud in the distance, until the fall of the Roman Empire permitted it to discharge its thunderbolts upon the helpless citizens. We have no such thunderstorm in the offing, and whilst we rejoice in the placid security, we are without the tonic that puts the nerves in quivering tension. We quit ourselves like men, but in other guise; for sentiment in the architecture of our time we must look now for a wider, more universal feeling than what has been shown for the past thousand years.

Mr. WALTER CRANE said he was happy in being called upon to propose a vote of thanks to Mr. Ricardo, for he had listened with the greatest interest and pleasure to the suggestive and highly imaginative paper. Mr. Ricardo in speaking of sentiment had propounded an extremely ingenious theory which illustrated rather how sentiment, as it were, received its influence from the outside. Mr. Crane did not quite share the same views expressed in the paper, for he believed such influences spread, if he might be allowed to say so, in the nature of contagious diseases. It was difficult to understand their source, just as it was hard to realise that the water seen in a calm could break out wildly on a stormy day. Then Mr.

Ricardo had spoken of the thirteenth century seemed to suggest that it was a puzzle to understand an affection for art then arose, and yet it was to examine some of the reasons for it. At any rate there were a good many elements in the social life of the time to account for the enthusiasm, and there were the foster art. They knew, too, it took at least three centuries to destroy the spirit of that work. What followed was accounted for by the growth of commercialism and puritanic tendencies of the time. The speaker always envied the optimism of Mr. Ricardo, and the idea they were living in so amiable an age. It seemed impossible to avoid hearing complaints of the disintegration of everything caused by the constant changes in modern life, and brought about by scientific discoveries and these disturbing elements Mr. Crane thought it was to hope for the future. The characterisation in the chief typical architectures of the past was architectural, i.e. the architect kings, the architect priests, the sculptors and the scholars' architecture. There was another architect, the speaker suggested, who was to develop the future and make that architecture more beautiful and splendid than any that had gone before.

Mr. LEWIS F. DAY, who seconded the vote of thanks, said Mr. Ricardo was like other poets and put his feelings into the things he described. He did not agree with Mr. Ricardo as was expressed in Mr. Ricardo's paper, more particularly when the author talked of the sophistication which was to be the future. They had certainly lost something of sympathy in work, but they had gained something in the way of sentiment to complain was rather a matter of sentiment of a kind. He had listened attentively to the paper and still puzzled as to what was sentiment in architecture, though he had respect and admiration for the speaker who inspired the paper.

Mr. H. H. STATHAM contrasted the architecture of Greece as examples expressing quite opposite sentiments. In Egypt, he said, it was the architecture of people who moved slowly and who had a strong sense of infinity, whereas in Greek work there was the expression of a people who were extremely rationalistic. To modern work, he would have liked to have had the architecture was devoid of sentiment and where there was sentiment. Many of their buildings were erected for very different purposes. He was as optimistic as Mr. Ricardo, and his own opinion was that this country was likely to experience serious changes before long.

Mr. GERALD HORSLEY said that Mr. Ricardo in his language had given them a most interesting review of sentiment in architecture. He had shown them how sentiment had a universal inspiration, sometimes an individual inspiration. He had instanced schools, hospitals and asylums as expressions of the collective sentiment of our day, and in the list we may add, he presumed, our municipal buildings, manufactories, shops and the houses we live in. We all welcome a return of a universal inspiration such as Mr. Ricardo has pictured. Some day it may be that the present its absence was responsible for much of the vulgarity and bad design which we see in modern architecture of the commoner kind. But which of these sentiments, the collective or the individual, interested them most as artists? He ventured to say it was the latter. To its fostering our education was, or ought to be, the chief aim. All training was intended to get the best out of the artist, and when the best came it not unfrequently came as a surprise to other workers, and not so much an expression of what they had all been wanting to do for themselves. However much a great artist might express the aims of his time, he more usually created his own sentiment. Take, for instance, Michel Angelo's ceiling in the Sistine Chapel at Rome—not a work of architecture, he said, but nearly akin—that revealed itself to a surprised artist. They got the same effect in an earlier time in the little incident which they would all remember in the work of Filippo Brunelleschi and Donatello. Donatello's crucifix of which he was greatly proud, and showed to Filippo, expecting approbation. Filippo smiled at him and on being pressed for his real opinion remarked that it seemed to him Donatello had put on the cross a man and not Jesus Christ, who was the Man most perfect in everything that ever was born. Donatello, feeling reproached, said, "If it were as easy to do a thing as to be a Christ would not look like a peasant; but to be a wood yourself and make one." Well, Filippo said, without saying anything to Donatello, he set

out his best into it, and then he invited Donatello to r. They would remember how Filippo arranged s so that the first thing Donatello saw on entering the was Filippo's crucifix put in a good light; they would mber his astonishment, how he dropped some of the and things he had brought for the repast and fled, g, "I have had enough; if you want anything take it. u it is given to do Christs, and to me peasants." We gather from this that it was not so much that Filippo smething that Donatello wanted to do and failed in, at he thought of and took the right line from the ning, a line of the highest art which Donatello had not ht of. We get this quality in other masterpieces; we in architecture in the work of the men who give the They might say it was the touch of genius which did ight be, but it was the touch of genius on a pre-soil, upon the man who had carefully trained him-it was the victory of the best-trained imagination, he course of our education should have this end in

he PRESIDENT, in putting the vote of thanks to the ng, said there was at least one point in the paper a would appeal to the younger members of the ciation. All the facts which had been put before them ight went to show that it was impossible to talk of nt history without alluding to its architecture, and fore the architect, knowing that he was helping to the history of his time, should endeavour to put the nto all his work.

r. RICARDO briefly replied and the meeting tered.

## ALLAN RAMSAY, THE SCOTTISH PAINTER.

THE Board of Management of the National Gallery, Edinburgh, have purchased a specimen of the por-work of Allan Ramsay, who was one of the best yn Scottish artists in the middle of the eighteenth ury. The portrait is that of Anne Bruce, the wife of as Williamson Bruce, of Arrol, and a daughter of Sir Bruce Hope, seventh Baronet of Craighall. It is ed in an oval, and in artistic grace will compete with portrait of Ramsay's wife, now hanging in the Scottish all Gallery.

According to Cunningham, Allan Ramsay, principal er to George III., was the son of Allan Ramsay, the and Christian Ross, his wife, and born at Edinburgh e year 1713, the eldest of seven children. His descent the noble family of Dalhousie is clear and undisputed; s claimed in verse by his father, and admitted by the mporary Earl, who thought it to his honour that the rer of Scottish national poetry was of the family tree. author of the "Gentle Shepherd" was, in fact, the -grandson of the Laird of Cockpen, a younger brother at old house.

Of the painter's early years we have but a brief account. began to sketch at twelve. Edwards, in his anecdotes, he was "rather self-taught." The first notice we have m is in a letter from his father to Smibert, the painter, 1736, when the artist was twenty-three years old:— son Allan has been pursuing his science since he was zen years auld; was with Mr. Hyffidg in London some time about two years ago; has since been ting here like a Raphael; sets out for the seat he Beast beyond the Alps within a month hence, be away two years. I'm sweer (*i.e.* loath) to with him, but canna stem the current which flows from advice of his patrons and his own inclination." The onage withheld from the father was, in a fit of repent-, bestowed on the son. He left Edinburgh for Rome ne 1736. There he studied three years, chiefly under mane and Imperiale, two artists of much celebrity in r day. He then returned with whatever he had learned otland, painted the head of Duncan Forbes and his own er, Janet Ramsay, both in New Hall, near Edinburgh; an excellent portrait of Archibald Duke of Argyll, in robes as Lord of Session, now in the Exchange, Glasgow, finally removed to London—the exact time is unknown. He found friends there of some value. The Earl of dgewater was one of his earliest patrons; and as the rse of events brought him into power, Lord Bute took lead, and introduced him to Frederick Prince of Wales, ose portrait he painted both in full length and in profile. the work which brought him more immediately into ce was a whole length of Bute himself; there was a n representation of nature, without the mannered affec-

tation of squareness which prevailed among his contem-poraries; the posture was very elegant, and the legs so remarkably handsome that Reynolds thought it necessary to exert himself more than usual in a full length which he had on his easel, saying, with a smile, "I wish to show legs with Ramsay's Lord Bute."

Ramsay's studies at Rome had not been confined to art: "he was smit," says Fuseli, "with the love of classic lore, and desired to trace on dubious vestiges the haunts of ancient genius and learning." For this task he was eminently qualified: he was a good Latin, French and Italian scholar, and, indeed, had mastered most of the living languages of Europe excepting the Russian: in his latter years, too, he studied Greek, and made such progress as entitled him to be called "a pretty scholar." His German he afterwards found of singular advantage to him at court. He was accused of being more anxious to be thought an accomplished scholar and a man of fine understanding and taste than a good painter—a profession for which he was said to have but a cold regard. "You will not find a man," said Dr. Johnson, who knew him well, "in whose conversation there is more instruction, more information or more elegance than in Ramsay's."

His admiration of the style of the great Italian masters brought upon him the wrath of Hogarth; and his now visible success in life, the satire of Churchill. The former desired to pun him down under the name of Ram's eye; and, what was severer, satirised him, in the Battle of the Pictures, in that long lot of old paintings impressed with the image and cross of St. Andrew; and Churchill, when he wrote the Prophecy of Famine, coupled him with his father in these disparaging lines:—

Thence came the Ramsays, men of worthy note,  
Of whom one paints as well 's the other wrote.

But for the satire of either the painter or the poet he seems to have cared little personally, and his father's fame was such as could take care of itself; the "Gentle Shepherd" will most probably be heard of as a work of genius as long at least as the best invectives of a tipling priest, "alike debauched in body, soul and song." The feuds which in those days distracted the united commonwealths of letters and art may be traced in many a bitter verse and satiric print and sarcastic memorandum. Ramsay, nevertheless, prospered in his profession; his skill in art and his reputa-tion for good sense and learning obtained him most exten-sive employment; his pencil was called to ceilings and to walls as well as to portraits, and he had several workmen under him who supplied bodies where he painted heads. Nor did he confine himself exclusively to his studies: he made a second journey to Rome, where he stayed several months; another to Edinburgh, where he remained long enough to establish, in 1754, "The Select Society." He amassed money also; for when his father died in embar-rassed circumstances in 1757 he paid his debts and settled a pension on his unmarried sister, Janet Ramsay, who survived to 1804. Indeed, it is stated on the best authority that before he had the luck to become a favourite with the king he was perfectly independent as to fortune, having in one way or another accumulated not less than forty thousand pounds.

With the accession of George III. came the golden days of Ramsay. The great merit of Reynolds was but partially acknowledged, for from some unexplained cause the king neither liked him as a man nor admired him as an artist; the wind of court favour therefore filled Ramsay's sails, and he obtained distinction as the first, where he at best deserved notice as the second. But this was not all; Shakelton, portrait-painter to the court, was in 1767 removed from his place, and the tradition of the London studios is that he broke his heart and died when he heard that Ramsay was appointed in his stead. This in-crease of honour brought increase of work; he was obliged to engage five assistants. Their names prove how much foreigners mingled with natives in the great manufacture of portraiture in those days:—1. Mrs. Black, a lady of less talent than good taste; 2. Vandyke, a Dutchman, allied more in name than talent with him of the days of Charles I.; 3. Eikhart, a German, well acquainted with draperies; 4. Roth, another German, who aided in the subordinate parts; and 5. David, commonly called Davie Martin, a Scotchman, and the favourite chief draughtsman and helper. One Vesperies, a foreigner, was occasionally employed to paint fruits and flowers. Such was the desire to have a portrait by Ramsay that he was fain to employ anybody to aid in advancing his pictures.

He invariably, however, painted the head with his own hand; at least it was not till his pupil Philip Reinagle began to distinguish himself that he trusted any thing of that order to the skill of others.

As His Majesty invariably presented portraits of himself and the queen to all his ambassadors and governors of colonies, Ramsay had a busy time manufacturing these royal effigies. The king sat for his coronation portrait, as it was called, in Buckingham Palace; in this piece he appeared in his royal robes, and in the like costume were all the succeeding pictures painted. It often happened that the king desired the painter to convey his easel and canvas to the dining-room that he might observe his progress and have the pleasure of his conversation. The painter, a bold, spirited, well-informed man, perfectly conversant with the state of the various kingdoms of Europe, spoke freely and without disguise; and as he was the only person about the court, save the domestics, who could speak German, the queen more especially found it an agreeable variety to chat with him in her native language. Ramsay, in short, was a great favourite. When the king had finished his usual allowance of boiled mutton and turnips he would rise and say, "Now, Ramsay, sit down in my place and take your dinner." This partiality produced, of course, abundance of enemies, but they could do him no harm, for he was not dependent upon royal favour, and the extent of his fortune was at least as well known and as sincerely envied as either his accomplishments or his courtly success. He had many high friends. Lord Bute, the Duke of Newcastle, Lord Bath, Lord Chesterfield and the Duke of Richmond, in particular, were frequently at his house, and that more, it was said, on matters connected with politics than painting. Ramsay loved and enjoyed this, for politics were his delight. He wrote with great vigour and facility, and dipped his pen freely in the public controversies of those times. He was known to be the author of many ingenious pieces on history, politics and criticism, signed "Investigator," and since collected into a volume. He acquired credit by a pamphlet on the subject of Elizabeth Canning, which had the merit of opening the eyes of the nation to the real truth of that mysterious story. He corresponded, too, with Voltaire and Rousseau, both of whom he had visited when abroad, and his letters are said to have been elegant and witty. Ramsay, in short, led the life of an elegant, accomplished man of the world and public favourite, the companion of the first of his day and the admitted ornament of the highest societies.

When he was busy with his first portrait of Queen Charlotte all the crown jewels and the regalia too were sent to him. The painter said such a mass of jewels and gold deserved a guard, and sentinels were accordingly posted day and night in front and rear of his house. His residence was in Harley Street, on the west side, just above the Mews, and his studio consisted of a set of coachmen's rooms and haylofts gutted, all thrown into one long gallery.

Soon after his appointment to be king's painter he made a third excursion to Rome, accompanied by his son, who afterwards rose to distinction in the army, and there, we are told, his chief pleasure lay in examining and copying the ancient Greek and Latin inscriptions in the corridors of the Vatican. This kind of employment, it seems, he loved infinitely better than his professional labours. He had, however, enough of the artist, and the Briton, too, about him to be much annoyed when he found the genius of his country questioned. The President of the Roman Academy, desirous of doing all honour to the King of Great Britain's painter, showed him the school of art and all the drawings of the students, but was rash enough to drop a hint that England had nothing of the kind that could compare with what he was exhibiting. Ramsay kindled up at this and said, "Well, sir, I will show you how we draw in England." He instantly wrote to Davie Martin, desiring him to put his drawings into his trunk and bring them to Rome. On the arrival of Davie, his master arranged all his drawings in due order, and then called in the President and his scholars. Ramsay always declared this to be the proudest day of his life, "for," said he, "the Italians were confounded and overcome, and British skill triumphant." That he believed in his victory there can be no doubt, but we know not what the Italian artists said of it. Rome at that time had few skilful hands, but in drawing she has generally excelled; her deficiency is in sentiment and in colour. Ramsay indulged his champion with a month's look at the wonders of the eternal city, and then sent him home to spread the news of this perhaps unlooked-for victory.

Ramsay himself presently returned to England, resumed his flourishing practice, until an unfortunate accident befell him, which made him lay down the brush for the rest of his life. Reading of a fire in which lives were at stake, he was so touched by the calamity that he rose and went to all his household and pupils to follow him, and he showed the way how they might make their escape, though, as in the story they had been perusing, the lower part of the premises were on fire. He put a ladder through the loft-door, desired them all to follow him, what he did, went quickly up, and said, "Now I am safe, can escape along the roofs of the adjoining houses." He turned to come down again he missed the step, fell, dislocated his right arm in so severe a way that it was never fairly recovered.

Happening at the time to be occupied with a portrait of the king for the Excise Office, he held up his right arm with his left, and so finished the work, and, what is remarkable, it was said, both by himself and others, that it was the finest portrait he ever painted.

This momentary effort speaks much for the spirit of the man; but his constitution had been sorely shattered by finding himself in a disabled state, he resolved to try the more vivifying air of Italy. Philip Reinagle had become skilful in the art, and Ramsay, leaving his brush to his pupil's hand, gave him an order to complete, during his own absence, fifty pairs of kings and queens at ten guineas each. Accompanied by his son he set off from London, but his shoulder continued painful; sleepless nights and more shook his frame, and his early alacrity of mind was gone. He reached Rome, however, in safety, and established himself once more among the scenes most dear to his fancy. Meanwhile, the copying of kings and queens began to weary Reinagle, and he wrote to Ramsay that he could not give more than five guineas was not price sufficient. Ramsay augmented the price to thirty; still this did not render the task less irksome. Reinagle manufactured the article according to contract, but the dose of portraiture was so strong that when the toil of six years, he completed his undertaking, he could think of that department again without a shudder. His imitation of Ramsay's style had by this time become so perfect that the work of the pupil could hardly be distinguished from that of the master.

Ramsay continued to reside in Italy several years, and maintained a correspondence with some of the men of his day both in France and England. His health, however, never was thoroughly restored; and a few degrees that love of home came upon him which, it is said, comes upon all. In the summer of 1784 he departed for his native land, which he expected to gain by short and easy stages. He reached Paris with difficulty; the roof of the carriage had brought on a slow fever which he failed to remove, and he died in August, in the seventh year of his age.

Ramsay was middle sized, well made and finely proportioned, and his looks were acute and intelligent. He was hasty and irritable, passionate and headstrong, but easily smoothed down and pacified; a steadfast friend and a most agreeable companion. In extent of learning and variety of knowledge he surpassed all artists of his time, and was considered an ornament to the Royal Academy, not so much as a portrait painter—though even in that he was second only to Reynolds—as for the accomplishment of a gentleman and scholar, his taste in poetry as well as in art, and his not inconsiderable powers as a writer. He was fond of delicate eating, and was as determined a consumer of tea as Dr. Johnson himself, but had no relish for stronger potations; it is said that even the smell of a bottle of claret was too much for him.

In his own art we may, perhaps, trace something of the same rather effeminate turn. His execution was careful and finished; but the freedom of his pen never reached the character of boldness; the placid and contemplative were his element, energy he never attempted and his colouring seldom deserted the region of the pale and the grey. Walpole has recorded his opinion that if he did not achieve a first-rate name, it was for want of subjects rather than of genius; and I shall conclude with the more detailed opinion of Northcote, in his lately published *Conversations*:—"There was Ramsay, of whom Joshua used to say that he was the most sensible of all the painters of his time, but he has left little to show. His manner was dry and timid. He stopped short in the middle of his work, because he knew exactly how much he wanted. Now and then we find tints and sketches which show what he might have been if his hand had been

conceptions. I have seen a picture of his of the soon after she was married; a profile and slightly but it was a paragon of excellence. She had a fan in and. Lord, how she held that fan! It was weak in tion and ordinary in features, but the furthest possible ed from anything like vulgarity. A professor might e it; but in the mental part I have never seen ing of Vandyke's equal to it. I should find it difficult duce anything of Sir Joshua's that conveys an idea of grace and delicacy."

## VICTORIA MEMORIAL, CALCUTTA.

E almost unconscious instinct of self-preservation which prompts a professional jury to see the best, to ignore the worst, in any expert declaration, for, or the like of which, they may any day themselves id responsible by one of those surprises which are s turning up in life, and cannot be shut out from the of specialists any more than from any other walk in life, t, of course, says *Indian Engineering*, entirely absent the report of the experts on the Victoria Memorial. It not be; but as it has not been betrayed into any ex- s, it calls for no further notice. If this report should the professional world to despair and land the lay intel- n confusion, it will be because the unknown quantity ations dealing with the caprices of subsoil moisture in elta of Bengal has refused to be reduced to terms. apparently unfathomable, unascertainable. The on entertained in the professional world on the in- te character of Colonel Trevor's finding on the Akra iments in 1876, so far as that opinion can now be ated from its only records, left some room for hope e uncertainty which haunted conclusions regarding character of foundations laid in Calcutta for massive ings might disappear in time (a) as massive build- grew more numerous and provided a wider basis eneralisation; (b) as differences in localities chosen ites brought into view all the varying conditions hich the safety of heavy foundations depended; and s professional opinion on the differing merits of various of bond, then in solution, crystallised into formulæ would afford safer guides. These expectations, so far y were actually formed, may be said to have been swept y the verdict of the experts on the Victoria Memorial ations; for while they arrive at some conclusions of derable value, and throw considerable light on the anism of the tests to be employed in laying founda- and have thus rendered a great service to the engineer architect for the future, they have left the true goal of research—definitive tests—as far out of reach as they before; and in exonerating the original advisers of Memorial as to the choice of a site from all blame what- er, have practically pronounced that goal unattainable. e buildings have sprung up on all sides since 1876 in utta, on sites far enough from each other to afford ations of every type of soil to be found underlying ations in the city; and if these have not between them ed up the secret of the definite criterion which should e engineers and architects in future, evidently—consider- the state of engineering knowledge at the present day, e limited character of the conditions possible within area already sufficiently widely experimented on—that itecriterion must be pronounced unascertainable. It is not use the limits of human knowledge have been reached, because the possible variation of conditions in a fully stigated locality are known, that definite tests are im- ble. That does not mean that large public buildings not be erected in future in Calcutta; far from that. It s that devices must be resorted to to counteract the er to foundations arising from the character of the sub- of Calcutta. Knowledge of the devices to be resorted ay, and doubtless will, go on increasing with further riments; and safety may finally be attained to even a ter degree than has already been secured in such ings as the Calcutta Museum, the High Court, and Army and Navy Co-operative Stores, but it will never possible to foretell that, because of every known pre- ion previously adopted, there will be no shrinkage oundations, or to resort to precautions which may be pted as a guarantee against shrinkage. There must be nkage in all huge structures. It is something to know even the Victoria Memorial Hall is not in a hopeless ition. The arguments by which the committee of erts have arrived at their conclusion must have been

read by every engineer in the country, and for most of them in the higher grades of the profession it will have possessed the attraction of an interesting romance. It may some day be transferred to these pages for permanent record. It is too compact and holds together in its serried sequences in too great a solidarity to admit of each of its four heads being considered in detail within the space available in these columns; but one or two points made by the committee as possessing much interest for the general reader and special importance for the profession must be reverted to on an early occasion.

## IMPROVEMENTS AT OXFORD.

DURING the Long Vacation some improvements have been introduced in the university buildings. A new reading-room has been provided at the Bodleian Library in the northern wing of the picture-gallery. For some years the west end of the wing had been partitioned off as a separate room, in which 50,000 volumes were stored. These have now been transferred elsewhere. The new room is a spacious apartment, extending the whole length of one side of the quadrangle, airy and well lighted. At Merton College the extensive alterations which have been in progress for several years are now practically finished. Twenty-three sets of rooms and one tutor's set have been completed since last October. A considerable advance has been made with the new residence for the warden, which is being erected in Merton Street opposite the college. When completed it will be a palatial building. By the liberality of St. John's College the first portion of new buildings bearing the legend "*Schola Æconomiae Rusticæ*" has been erected upon what is known as President's Paddock, fronting Parks Road, and is now in use by the Sibthorpe Professor of Botanical and Research Work. An extension is shortly contemplated to provide a forestry museum, library, lecture-rooms, &c. Satisfactory progress has been made with the extension at Jesus College, and nine sets of rooms will be occupied this term. The more important buildings will not be out of the builder's hands before the end of the year. These include a physical research laboratory, a large lecture theatre with professors and assistants' rooms, the Meyrick library, chemical and biological laboratories, &c. Under the direction of Mr. T. G. Jackson, R.A., the erection of the new chapel at Hertford College has been rapidly pushed forward. The site is confined, and only two bays of the new chapel, with a small cloister and a tower come into the college quadrangle, but space has been found between the three colleges of Hertford, New and All Souls for a very sufficient chapel, measuring inside the walls 84 feet by 24 feet 6 inches. It will be fitted with handsome oak stalls, and there will be a gallery at the west end for an organ over an ante-chapel. The cost of the building will be about 7,250*l.* Further additions have been made at the university museum. An extra storey has been erected to the geological department of the Pitt-Rivers museum, providing a large extra room for students.

## LONDON COUNTY COUNCIL ARCHITECT'S DEPARTMENT.

THE London County Council on February 19, 1907, decided to retain until October 31, 1907, the services of Mr. J. E. Burrows, an assistant in the second class in receipt of 200*l.* a year, who attained the age of sixty-five on March 22, 1907. Mr. Burrows entered the service of the late Metropolitan Board of Works in October, 1876, and has done useful work. The Council have power under the Superannuations Act, 1866, to grant him a pension of 103*l.* 6*s.* 8*d.*, which is recommended to be paid, being thirty-one sixtieths of his present salary.

The establishment committee have considered the course to be taken in view of recent resignations of four assistants in the architect's department, and also of the retirement of Mr. Burrows. The resignations referred to are those of Mr. J. Todd (senior assistant, 400*l.* a year), Mr. C. W. Surrey (upper division, first class, 280*l.* a year), Mr. W. R. Davidge (lower section, first class, 215*l.* a year), who have been appointed district surveyors, and Mr. A. E. Bell (lower division, first class, 200*l.* a year). The five officials mentioned were employed on important technical work in the administrative sections of the department. The statutory administrative work of the department has been considerably added to by the operation of the London Building Acts (Amendment) Act, 1905, under which a large amount of

important work in connection with the provision of means of escape in case of fire has devolved on the Council, and also by the steady increase in the number of Building Act applications for special buildings involving statical calculation. The officials who have left the service were trained in the special statutory work they were called on to perform, and it is very necessary that the vacancies should be filled at once by experienced officials in order that the staff of the department may be of the proper strength and status to deal with applications which are constantly being made to the Council under the Acts referred to.

To fill the vacancy for a senior assistant the committee recommend the promotion of Mr. E. T. Mitchell, now in receipt of 300*l.* a year. They are advised that he is thoroughly acquainted with the work of the Building Act section of the department and discharges his duties with marked efficiency. The other recommendations which follow the usual course in filling vacancies include the permanent appointment of five assistants, at present on the unestablished staff, who are all well qualified for the technical work which will devolve on them. One of the consequential vacancies on the unestablished staff caused by the promotions will not be filled up, and taking this into consideration the adoption of the recommendations will result in a reduction on salaries of 674*l.* 6*s.* a year, and ultimately in four years' time a yearly reduction of 238*l.* 10*s.*

**"The Architect" as a Matrimonial Agency.**

SIR,—I am a constant and interested reader of your valuable magazine, and frequently do I note with sentiments of cordial approval the eclecticism you evince in regard to matters dealt with within its pages. I must consider it as a strange oversight on my part in having failed to observe your kindly efforts to provide mates for disconsolate celibates. But I gather from Mr. Robert Williams's letter to you in the current issue that he owes the joys of matrimony to you as a result of advertising in your columns. I wish I had earlier known this fact; as it is, I fear that I am too old to profit by it. I cannot altogether hold you blameless in the matter, for I think you must have somewhat skilfully concealed the advertisements for matrimonial aspirants for them to escape my eagle eyes. Is it, Sir, that "you did good by stealth, and blushed to know it fame?" You may judge by my handwriting that I am well advanced in years, nor have I ere now regretted the slow advance of time; but when I read of "the flowers of love" strewn along Mr. Williams's path, then indeed do I regret that I have already reached the stage, Sir, of yours obediently,

THE LEAN AND SLIPPED PANTALON.

I enclose my card as evidence of good faith.

Crosby Hall.

SIR,—The provisional committee at its meeting to-day carefully reviewed the whole situation, and noticed with satisfaction the widespread interest in the preservation of this famous building and the extent and various sources of support as shown by the large number of donors of very varying sums in all parts of the United Kingdom. But the committee have also had to face the fact that all the donations and promises up to to-day do not exceed 10,000*l.*; and having regard to the definite statement by the Chartered Bank that the scheme must be completed or abandoned by the 29th inst., the committee feel they ought to state the case quite frankly to the public as it now presents itself.

Shortly, it may be said that unless a guarantee of 60,000*l.* be obtained by the 28th inst. the committee cannot see their way to proceed with the scheme and the bank will be in a position to proceed, as they have definitely stated they will do, to demolish the building.

It is right the committee should add that it appears by the vast amount of correspondence they have received that the feeling of desire to secure the building for the nation as a centre in the City of London for a meeting-place of the ancient guilds and modern organisations having kindred aims is not less strong than the desire to preserve it on account of its architectural beauties and wealth of historical associations.

In these circumstances the committee can only appeal to your generosity to present this bare statement of facts to

the public. And the committee will venture still to maintain the hope that at this critical moment, when the preservation scheme trembles in the balance, some of substance and public spirit may be found to guarantee the amount—60,000*l.*—required by the 29th inst. It is that the scheme may ultimately be carried out by subscriptions from the public, although it cannot be expected that the whole amount will be forthcoming by the 29th inst. It should be noticed, further, that some larger guilds do not meet till next month and their contribution could not in any case be received in time.

The case, therefore, resolves itself into one of the probability of obtaining the requisite guarantee by the date. The individual members of the provisional committee contributed to the fund, and are anxiously desirous of securing the object which has such general public approval. They feel that it is due to themselves to state the day on which the scheme stands at this moment, in order that it may be possible to secure a guarantee while there is time.—Yours obediently,

T. VEZEY STRONG,

Chairman of the committee.

Guildhall, E.C.:

October 22.

**GENERAL.**

A Memorial Tablet has been erected on No. 28, Street, Golden Square, where William Blake resided for one time. The tablet is of encaustic ware and is of a rich blue colour.

Admiral Sir John Hopkins and Mr. H. L. Hansard completed the audit of the accounts of the Romsey pageant. The receipts for the three days' performances amounted to 4,200*l.*, and the expenditure left a balance of 575*l.* for the Abbey Restoration Fund. In addition 320*l.* was collected during the pageant.

The York Education Committee will approach the trustees of the York Exhibition Buildings and Art Gallery who promised the committee financial assistance for the purchase of a picture apart from those supported out of the rates, with a view to procuring from the trustees the balance in order to form as a nucleus towards the sum necessary to purchase at least one of a number of paintings by the late J. M. W. Turner, Moore, a famous seascape painter and a native of York, whose works which have been offered to the Corporation for sale are of great value relative of the artist.

The Newcastle-on-Tyne Corporation propose to build 72 single-room dwellings at a cost of 8,748*l.* At the meeting of the Government Board inquiry the acting town clerk was asked by the inspector as to the reason for proposing single-room dwellings, and in reply he quoted the returns showing a large number of single-room dwellings in the city. Mr. Holford, property surveyor, pointed out that the dwellings would be unique, as they would be fully furnished. They would cost about 100*l.* per dwelling, and rent chargeable would be 3*s.* 8*d.* The inspector expressed the opinion that the design was a very excellent one.

Mr. A. G. Heaton, architect for the new guildhall, has recommended to the Guildry Incorporation of Perth the reversion to the original plans in regard to certain details of the interior of the hall. This comprises two sculptured figures bearing a shield containing the city arms above the middle window and an ornamental bell-tower vent in the tower. The sculpture work would be carried out by one of the tradesmen in Edinburgh, and the effect of this and the tower would be to give the hall a much more important appearance than it otherwise would have. Mr. Heaton expressed strongly of opinion that on this ground alone the original plans should be adhered to. The extra cost will be 150*l.*

A Special Sub-Committee of the Glasgow Corporation will consider whether a portion of the surplus of the Glasgow International Exhibition, 1901, amounting to 5,000*l.* interest at May 31 last, to 41,441*l.* 12*s.* 1*d.*, could be applied by the Corporation in the payment to the parks department of 7,500*l.*, expended on sculpture work at the Glasgow Art Gallery in the Kelvingrove Park, over and above the 5,000*l.* included for that purpose in the original estimate of the cost of the buildings.

The First Part of the collection of work by the late John Finnie is to be sold by auction at the Waverley Galleries, Liverpool, on Wednesday, October 30. This will consist of the oil-paintings, a large number of which were included in the Memorial Exhibition at the Walker Art Gallery. The second portion, comprising the water-colour drawings and mezzotints, will be offered about a fortnight later.

## THE WEEK.

was a discussion on Tuesday when the project to establish a Professorship of Engineering came before a Congregation of the University of Oxford. Professor MIERS, who represented the said it was not proposed to introduce workshop but only to give laboratory instruction. of the large engineering firms had promised ce. It also was to be anticipated that students' uld be large, for last year 6,000l. had been at Cambridge. Great professional subjects be recognised. Professor MIERS said he had in America how all the highly-paid posts in ing were held by Americans. It was to be hoped men would hereafter fill some of them, and the f such engineers should be considered a national he Rev. E. M. WALKER opposed the statute on nd that the studies were not in keeping with t of the university. Sir WILLIAM ANSON, M.P., ey could not supply full instruction in engineer- could also be said of the study of law and in the university. In the Chancellor's appeal rements of engineering came first, and if the y turned its back on this proposal they would lament a lost opportunity, but the vote would ignored the position it ought to occupy in g engineering study. On a division the statute sed by 152 votes to 20. Such a conclusion is e to Oxford and it is a recognition of the wants ime. It is true, mathematics, mechanics and science have been part of the Oxford curriculum. y were considered abstractedly, and it was eir practical applications were recognised.

University of Oxford will be certain of receiving ture efficient aid towards the school of engi- Professor L. F. VERNON HARCOURT, the g engineer, who died on September 14, has ed the greater part of his estate to his wife for after her death it is to go to the University of or the support of the school. He has also left University 1,000l. for the promotion of the of engineering science there, and also his ions and Proceedings of the Institution of Civil s and twenty volumes of the "Annales des t Chaussées," being his Telford premium in d a selection of his other engineering works to e basis of an engineering library. To the on of Civil Engineers the Professor bequeathed n memory of the many advantages he had rom its library and lectures, to found a yearly al (in the discretion of the Institution) lecture, remium or prize in connection with river, canal ime engineering, besides a selection of his ing works. To University College, London, in was formerly professor, he has left 200l. for a ize in civil engineering.

interesting case relating to the responsibility for carrying out extensive drainage works at a hydropathic establishment has been heard Mr. Justice WARRINGTON. It occupied several he defendant, Dr. FERGUSON, took a lease of ises for twenty-one years at a yearly rental He covenanted besides paying "all impositions oings" to keep in repair all inside sinks and The lessors undertook to pay for all work to drains except where the expense arose through ee's failing to properly clean them. After a e local authority ordered certain works to be . The lessee declined and they were carried he lessors at a cost of 616l. As the lessee

refused to pay the action was taken. It was maintained by the plaintiffs that the works fell within the "impositions and outgoings." Evidence was given about the state of the drains, and it was asserted an action was pending, which was brought by Dr. FERGUSON against the local authority. Mr. Justice WARRINGTON said the question he had to determine was whether the work done was the work specified in the sanitary notice, and for which the defendant was liable under the covenants of his lease. He was of opinion the work, though perhaps the most economical method of complying with the notice, and the one that a prudent owner would have adopted, was not work specified by the notice. There was no independent claim for damages, and the claim for the specific sum for work done (616l.) was hopeless. The plaintiffs therefore failed, and there must be judgment for the defendant with costs.

ONCE a year the five academies forming the French Institute hold an assembly in common, when a representative of each of them delivers an oration. On Friday last the Académie des Beaux-Arts deputed M. PAUL RICHER to speak the speech required. He selected as subject "Anatomy and the Plastic Arts." Two propositions were introduced, viz. that anatomy was useful and even necessary when applied to a living subject, but that it was dangerous when the subject was a corpse. One at least of the propositions will seem startling, for it is doubtful whether any man or woman would submit to dissection for the benefit of students of art. What M. PAUL RICHER contemplated was the confining of anatomy to external forms. He was able to adduce the authority of INGRES, who, although a marvellous draughtsman, looked on anatomy as horrible. But INGRES considered that the painter and sculptor should be well acquainted with the skeleton, which resembles the steel framework of modern building construction. He considered the muscles of less importance, and owned that, although he regarded them as friends, he did not know one of them by name. There is little doubt that some artists, when they gain acquaintance with anatomy, are too apt to make a display of it. At a time when realism is in favour anatomical display is likely to be approved, although impressionism is a check on it. Probably it was on that account M. PAUL RICHER would restrict the artist to external forms, regardless of the necessity of knowing something about the inner forces which produce motion and action.

THE Edinburgh Dean of Guild, after his re-election on Monday, said that this year's returns showed a decline from those of last year in the amount to be expended on buildings. He considered that a special Building Act was required for the city. One object of it should be the adoption of an uniform plan or system which, without unduly hampering owners of land or detracting from letting value, would insure that, as building went on, it would be on such lines as would conduce to the beauty and dignity of a well-ordered city, and to the health, comfort and convenience of the people. At the present time in laying out ground for building within the city each proprietor proceeded independently and laid out his ground as it seemed best to himself, and often without a proper relation to existing roadways and adjoining properties. It was possible for a comprehensive plan to be prepared by which, when a proposal was submitted, the application could be dealt with in a more judicial way than was in operation at the present time, and that notice should be served upon the adjoining proprietors whose interests might be affected. A similar desire has been expressed by the authorities of several English towns, but as the change would affect many vested interests delay is inevitable. Sooner or later the initiative will have to be taken by the Local Government Board.

## PUBLIC WORKS IN IRELAND.

ANYONE who is accustomed to the study of Blue Books will be surprised at the appearance of the report of the Commissioners of Public Works in Ireland. It might be supposed from the amount of space devoted to antiquities that old work rather than new received their attention. There is a catalogue of inscribed slabs, including Celtic crosses, at Clonmacnois, which is illustrated by over 200 diagrams. There are also plans and illustrations of the Seven Churches belonging to that religious settlement. Although in past years attention has been given to remains, such an elaborate description as we have this year is, we believe, without precedent.

The care of national monuments is, however, but a part of the responsibilities of the Commissioners. They have other charges on sea as well as on land, for sea fisheries and marine works are controlled by them. During the year they have also lent money to the extent of 487,855*l.*, and about 10,000,000*l.* of arrears are still outstanding. The works are, in fact, so varied, it is difficult in a short article to decide which are most deserving of selection.

What are known as "state residences" in Ireland are not of a grandiose character. It does not sound well to hear that the overseer's cottage at the residence of the Lord-Lieutenant has been rendered more sanitary, and that owing to their very decayed state the walls at one part had to be rebuilt. The Under-Secretary, as a resident official, has to show hospitality, and, as there has been a deficiency of accommodation, "the servants' bedrooms on the first floor of the laundry building have been altered and improved so as to render them fit for occupation by visitors." Various other official buildings have also been improved. Some of the old floors in the Chief Secretary's office which showed signs of failure were strengthened with steel girders. One of the old nobles' houses in Dublin—Aldborough House—is used as postal and telegraph stores. The stone cornice was so decayed it had to be removed, and a concrete cornice of less projection substituted. The national schools and teachers' residences throughout the country used to be controlled by the Commissioners. But apparently grants for repairing them have to be restricted, although their condition is discreditable to the country. Only four applications amounting to 490*l.* were received during the year, while forty-three applications for loans were made in respect of teachers' residences. One reason for the apparent illiberality is found in the preparation of new type plans which may lead to many improvements. The applications for lunatic asylum buildings totalled 21,452*l.* Under the Public Health Act applications for 103,847*l.* were received, of which nearly three-fourths related to waterworks. A sum of 57,350*l.* was lent under the Labourers' Dwellings in Towns Act. That sum is, of course, in addition to loans for labourers' cottages in country districts.

The light railway system does not appear to be successful in Ireland. In most cases the greater part of the principal remains due, and there are also arrears of interest. Yet with this experience it is still common to hear the construction of light railways advocated as an indispensable aid to prosperity. Arterial drainage is another necessity. The most recent Commission on the subject have recommended that a central drainage department should be constituted, with conservancy boards to have control of the main river basins and drainage committees to deal with the minor streams. As the works necessary, especially with main outfalls, will exceed the benefit derived by the landowners and their tenants, it is advised that the excess should be borne by the Government. Already immense sums have been expended during the last sixty years. But it cannot be said that the grants have been repaid or that the land is less liable to flooding. The difficulty of the problem is suggested by a paragraph relating to the Bann drainage. In 1904 Mr. Dick, the Commissioners'

engineer, estimated that 150,000*l.* would be needed to produce any satisfactory result. Last year Sir ANDER BINNIE investigated the problem, and came to the conclusion that if the navigation of the river was abolished the diminution of floods would not cost more than 76,000*l.*, or one-half the sum named by Mr. Dick. The latter dissents from Sir A. BINNIE's conclusion and maintains that the results desired are not attainable by the methods proposed. The rival reports are now under the consideration of the Government, and will be taken for granted another engineering investigation will follow.

The Public Works Commissioners have 214 castles, national monuments under their protection, and might have had fourteen more, for they were not counted. They have also 214 castles, giants' graves and raths to that number. The Land Commissioners, but they were of such a character as not to warrant guardianship. It is not a branch of the service, for the whole of the outlay for the year amounted to no more than 593*l.* 9*s.* 9*d.*, which sum 353*l.* 18*s.* 7*d.* was expended on the outlay and travelling expenses of the inspector and works, caretaker's wages, &c. The largest sum expended on any one building was 34*l.* 5*s.* on Killevy Church. For that sum the walls have been pointed and weathered; all the trees and shrubs to injure the structure have been removed. The outlay on St. Audeon's Church was 1*s.* 3*d.*, and on the tower and church 1*s.* 8*d.*, and 2*s.* on Clones tower and church. Anti-restorers can therefore be comforted that the outlay would be insufficient to perpetrate no

Some of the work which has been secured on economical terms is worth notice. A church at Drogheda, co. Meath, is supposed to be the first stone church in Ireland. What remains of it is now in good condition. At Bective Abbey all the ivy which was ending the structure has been removed and the roots pulled up, also the whole of the walls have been carefully pointed and weathered, and the arches and vaulting of the lower chambers have been secured and made water-tight. Mellifont Abbey, co. Louth, was founded in 1142, was utilised to a great extent in the last century to build a large corn mill. According to the report, "the remains of the abbey, old gateway and gateway have been thoroughly overhauled and put into a proper state of preservation. The stone carvings and mouldings stored in the house were all carefully taken down, replaced and properly secured; also a guard rail was fixed to serve these stones against injury. Excavations in the cloister garth brought to light the foundations of other buildings and the correct position of the arcading." A plan of Mellifont Abbey appeared in the report for 1903.

The outlay on Clonmacnois during the year was down at 20*l.* But in preceding years there was a large expenditure. In the middle of the sixth century a monastery was founded there, and the site was selected, for it is about the centre of Ireland. Owing to its importance it suffered from invasions, and it appears that in 845 TURGEIN, Norse king, enthroned his wife OTO on the altar of the chief church at Clonmacnois. The Goddess of the altar of Notre-Dame, Paris, was there for 900 years in Ireland. One of the reasons for the invasion of Ireland by the Danes was to revenge the wrongs of O'Rourke, King of Brittany, whose wife DERVORGILLA eloped with MURCHAD, king of Leinster. Like another Goddess she entered the nunnery at Clonmacnois. There still remain two round towers, three stone crosses, eight churches, a castle and twelve wells. The attractiveness of Clonmacnois as a resting-place is suggested by some two hundred tombstones. The whole group of buildings was placed in the Board of Works in 1880, and since then necessary but small works of conservation have been carried out. The collection of ornaments

tions will be interesting to all students of history, for they suggest that the character of the ornamentation and lettering must have been determined, as there is an avoidance of the freaks and varieties which bring ridicule on many modern varieties. Celtic interlacements are rather rare, and though the key or fret pattern is common, some of the examples are more primitive than any found elsewhere. It is to be regretted that crosses which in 1822 were perfect are now mere fragments. In one case the name of the carver or mason, for the inscription appeals for "a prayer for THURCAN, by whom the cross was made." The report would be interesting if it contained nothing more than the elaborate description of Clonmacnois, by which it becomes a novelty in official publications.

### GLIMPSES OF ARTISTS.\*

AMONG the poets engaged in Government offices during recent times WILLIAM ALLINGHAM was one of the most distinguished. He was a native of Ballyvaughan, in the north of Ireland, and he has written pleasing verses about the town which is known for its salmon-fishers. He became sub-controller of the Excise, and in his thirty-eighth year he was transferred to the London establishment. Some years before, however, resigned in the hope that he would obtain a name, as well as an income, in literature. He has written some simple but charming poems in *old Words*, and his poetry had been praised by judges. But some of his friends, including Tennyson and THACKERAY, advised him to return to a profession in which he was assured of a regular salary and pension. An opportunity was offered him to resign his appointment in London for one at Lymington, Hampshire. There he became acquainted with John Ruskin. The offer of the sub-editorship of *Fraser's Magazine*, under J. A. FROUDE, induced him to return to London. He grew to be intimate with many artists and writers, especially with those of the pre-Raphaelite school, and a few years afterwards he was married to Helen Paterson, the water-colour artist.

ALLINGHAM kept a diary which does not appear to have been intended for publication, but rather for use by himself, and as a basis of an autobiography; but the only part which he amplified was relating to his early life in Ireland. From his diary, and his prepossessing manner he could hardly be expected to make a great many acquaintances. Their names are introduced on every page, and we sometimes get reports of their remarks, but it is difficult to resist the impression that a work which might have been more interesting than any of the diaries published during the last century was left in a fragmentary state.

There is no difficulty in realising from his poems that ALLINGHAM was a lover of form and colour. We learn from his diary that he was always able to appreciate the most characteristic in an artist. MILLAIS and his illustrations for some of his poems. But he does not appear to have often met the painter. We learn, however, that TENNYSON pointed out to MILLAIS the mistake in mixing daffodils with wild roses in his poem. MILLAIS said he painted the roses from nature, but some time afterwards he wanted to introduce yellow flowers, and he sent to Covent Garden. As he had daffodils he painted them. DANTE G. ROSSETTI is frequently mentioned in the pages, for ALLINGHAM was as often as possible. After an absence he wrote "My old regard for D. G. R. stirs within me, and would be as warm as ever if he would let it." ALLINGHAM said of ROSSETTI:—"It is plain that the natural, the naïve are merely insipid in his poetry; he must have strong savours in art, in literature, in life. Colours, forms, sensations are required

to be pungent, mordant. In poetry he desires spasmodic passion and emphatic, partly archaic, diction. . . . In painting, the Early Italians, with their quaintness and strong rich colouring, have magnetised him. In sculpture he only cares for picturesque and grotesque qualities, and of architecture as such takes, I think, no notice at all."

RUSKIN was always ready to admit his indebtedness to CARLYLE. It is satisfactory to find that CARLYLE in turn admired RUSKIN. He once remarked:—"A celestial brightness in him. His description of the wings of birds the most beautiful thing of the kind that can possibly be. His morality, too, is the highest and purest. And with all this a wonderfully folly at times. The St. George's Company is utterly absurd. I thought it a joke at first." WILLIAM MORRIS was an early acquaintance, and the description of him in few words is not unfair, "brusque, careless, with big shoon;" or another page, "pleasant, learned about wines and distilling." BURNE-JONES appears to have been the closest of all his friends among the artists. Of the only architect who belonged to the set, PHILIP WEBB, we have occasional mention.

THOMAS WOOLNER, the sculptor, was akin to the pre-Raphaelites. As a brother poet, ALLINGHAM could meet him without any jealousy. He also lived occasionally in the Isle of Wight, and was acquainted with TENNYSON. Poor WHISTLER does not fare well in the little that is said of him in the Journal; and it is to be feared posterity will form a strange estimate of him. When we first encounter him he talks only about his own pictures. We learn, too, that CARLYLE spoke of WHISTLER as the most absurd creature on the face of the earth. But if the dyspeptic sage could be taken seriously, there were a great many able men who occupied the same position.

The most prominent figure in the diary is THOMAS CARLYLE. He was so communicative, there is no doubt he expected ALLINGHAM would become his Boswell, and it is to be regretted for CARLYLE's sake that a different arrangement was made. It is unnecessary to say how contemptuous was CARLYLE to everything which was called art. He was never, he said, at an exhibition of the Royal Academy. But he could not help admiring one architectural work—St. Paul's Cathedral. He visited it on a Sunday evening, and when he was seated he observed, "Ah, this is a fine place." It was the finest cathedral he had seen, and the dome was a "bonny thing." He recalled his first view of the building when he was a guest of EDWARD IRVING. It was not unusual with CARLYLE in his later years to confess to some of his oversights, and as a resident in Chelsea he seemed to regret his want of appreciation of WREN's military hospital. "I lived for many years," he said, "beside that hospital of his before I took much notice of it, and then I began to perceive that it was a building of most thorough adaptation for its purpose—well conserved, well built in every particular." He agreed with ALLINGHAM that it was odd there should be no street in London bearing the name of the great architect. CARLYLE afterwards visited St. Paul's five or six times.

TENNYSON also looms largely in the diary. Like CARLYLE, he cared little for any form of art which was not literary. On one occasion TENNYSON discussed the difference between beauty and picturesqueness. His theory was, "take a trim, snug, unbeautiful house, half ruin it, and you make it picturesque, same as ragged clothes," &c. ALLINGHAM maintained the connection between absolute beauty and regularity. The old English writers about the picturesque generally adopted a view similar to TENNYSON's, but it cannot be said that a broken and defaced ancient statue appeals to us equally with the ruins of an abbey.

There is an American word "hurrygraphs" which could be applied to the entries in the diary of WILLIAM ALLINGHAM. But we should remember that the recorder was a man of genius, and although he may use only a

few words they are more suggestive than many elaborate descriptions. It is not difficult for an intelligent reader who was acquainted with English literature on art during the last half of the nineteenth century to realise fully the indications which ALLINGHAM gives. The pages often throw an unexpected light on important events, and the volume will be found as pleasant reading as a modern novel. Among the illustrations are portraits of CARLYLE and TENNYSON by Mrs. ALLINGHAM.

#### ROAD MAKING AND MAINTENANCE.\*

**D**URING the seven years which have elapsed since we noticed the first edition of Mr. AITKEN'S book the subject of roads has received greater attention from the public in general than at any previous time. The increased use of motors has become a test of the durability of a road, and may be said to supply an intensity of force which was never anticipated by road makers in any former age and for which, accordingly, adequate precautions were not taken. There is no doubt motor-ing is an unfair test of an ordinary road, for it is more severe than the traffic at collieries, for which provision had to be made by laying down rails without any anticipation that they were to develop into the railway system which is now almost universally employed. If the Romans had to provide for anything resembling motor traffic, they would undoubtedly have introduced a more elaborate system of construction.

The effect of the motor traffic is not merely a disturbance of the road surface, but the wear and tear has produced such an increase of noise and dust as to amount almost to a plague, especially in cities and large towns. The vast number of houses which remain unoccupied in streets which are selected by motorists is evidence of one kind of inconvenience which arises from the unsuitability of most systems of construction to withstand the new force. There is no question that means could be adopted to increase the power of resistance in streets and roads. But the expense would probably exceed in amount any of the assessments which are now levied. On the other hand, there is at present no law by which motorists could be forced to contribute towards the expenses of which they are the cause, and it is unfair to impose obligations on a large number of people in order that a few might be benefited.

Mr. AITKEN is surveyor to the County Council of Fife, and as such he is compelled to study the new problem. When we remember that cars with an axle-weight of 12 tons are allowed, it is not difficult to imagine what must be the effect of such a weight upon ordinary roads. The days are gone when General MORIN could announce as a result of his experiments that at a walking pace on all roads the resistance is practically the same for all vehicles. However slowly some modern motor vehicles might pass, the effect on the road surface would not be insignificant. Mr. AITKEN was a member of the committee of the British Association on the "Resistance of Road Vehicles to Traction," and he gives in his appendix the most important parts of the report. One of the witnesses said that if the limit of weight per wheel was increased sufficiently to overcome the frictional cohesion of the molecules of the road, an entirely new set of conditions arose and the road resistance would be out of proportion to the increased weight on the wheels. This would seem to indicate that at present it is not feasible to determine the relations between the weight and speed of vehicles and the injury to the road. For with a variety of modes of construction it is impossible to foresee how far each will bear the strain upon them. A modern road to some extent resembles a structure, but

we cannot determine all the conditions with the exactitude as in the case of an arch of masonry brickwork, or a truss of steel or of timber. In such examples large allowance should be made for contingencies, but in the case of roads expenditure is always limited.

It is generally admitted that granite setts or concrete have an endurance of about twenty years. Endurance is not the only quality that is desired. According to Mr. AITKEN:—

Many of the hardest and most durable stones have been discontinued in London and Liverpool, owing to the effect of these wearing smooth and becoming slippery, even in normal conditions of traffic and weather. This is the case with the old blue Penmaenmawr stone, however, is not now much used for setts, but is primarily manufactured into kerbs and channels. On the other hand, Aberdeen granite setts are preferred in London, Mount Sorrel and Guernsey granite, although the latter is better in some respects, because the surface remains smoother even after considerable wear. It is also much less expensive to cleanse than these and most other kinds of setts used for paving. Whinstone setts are greatly used in provincial towns where the traffic is not excessive, but pavement made with this material, although it wears faster than granite, invariably maintains a rough surface and consequently does not become slippery like the granite already mentioned. These pavements are being gradually superseded in London by wood paving.

Mr. AITKEN recognises the advantages of concrete, or small sett pavements in which stones of 3½ inches to 4 inches and from 4 inches to 4½ inches in depth are laid on Portland cement concrete, or a filling of cement mortar. But they can also be used for macadamised roads. The system has been adopted in Lancashire; it is, however, too early to pronounce a definite opinion in regard to its adaptability to the requirements of this country, or as to the advantages claimed for it. Wood pavements have many advantages for residents in towns; but like macadam in connection with pavements, it is difficult to determine what kind of wood is most suitable. Some is said by some to wear into holes in which water collects and which leads to decay; while other authorities declare soft wood wears more evenly than hard wood. The West Australian woods are much used. Mr. AITKEN considers that the dowelling system gives a union or bond of the greatest strength and tenacity, the blocks being firmly in position at every point. Last year it was asserted that the creosoting of deal blocks had a very injurious effect on the beds of flowers in Parliament Square, Westminster, but the evidence was not conclusive. Another preserving system is known as "Powellising," which is claimed to add to the durability, is inodorous, easily and quickly applied, and the result is about the same as creosoting.

The treatment consists in immersing the blocks in a cold antiseptic saccharine solution in open tanks, the temperature being gradually raised to boiling-point and maintained at this heat for a short period. The moisture during the boiling escape in the form of steam, and in the subsequent cooling of the solution, which occupies some of the wood absorbs the saccharine matter and is then permeated with it. The blocks are then removed and placed in a drying chamber for a few hours, after which they are ready for immediate use. The application of pressure and vacuum, which weakens the fibres of the wood and which is inseparable from the creosoting process of treatment, is not employed in this process.

A long description is given of the viagraph, by which a section of a road can be produced which will be sized vertically, and is therefore well adapted for comparison and tests. It might be compared to a micrometer. It was invented by Mr. J. BROWN, F.R.S., an intelligent man or boy can use it. Mr. AITKEN states that in his practice two or more continuous viagraphs are taken parallel to each other for a distance of

\* *Road Making and Maintenance*. A practical treatise for Engineers, Surveyors and others, with an historical sketch of ancient and modern practice. By Thomas Aitken, M.I.C.E. Second Edition. (London: Charles Griffin & Co., Ltd.)

in that way a fair average is arrived at, and if the  
 re carried out periodically the comparative wear  
 enness during a given period is indicated. A  
 of tables are given which suggest the applicability  
 viagraph to pavement of asphalte, wood, setts  
 acadamised road. The inventor believes that  
 e aid of the viagraph contracts for road making  
 e made more definite by the insertion of a clause  
 effect that, when tested by the viagraph, "the sur-  
 ist not show any rut or depression of more than  
 s, nor unevenness of more than—feet per mile."  
 prevention of dust has engaged the attention of  
 hor during several years. He has invented a  
 ayer by which tar in a cold state can be applied  
 rm of a cold mist or spray under considerable  
 e. The depth of penetration depends on the  
 on of the surface and the material employed  
 epairing the road; generally it is 1 inch, but  
 up to 3 inches. We are told that the cost of  
 g the tar by this method at 2d. a gallon and  
 g team labour would be 11l. on one mile of  
 feet in width. On a road 24 feet wide the cost  
 e 15l., or about a farthing a square yard. Mr.  
 does not advise the use of boiling tar to a cold  
 urface. By his invention the application of tar  
 s more economical than hitherto, and it has been  
 d the first prize in the competition.  
 new edition of "Road Making and Main-  
 " represents the conclusions which have been  
 d from the experiments of English and Scottish  
 urveyors as well as of several foreign investi-  
 The information is conveyed in a clear manner,  
 strations are numerous, and the book may there-  
 recommended to those who have charge of roads  
 as to contractors.

## PRINCIPLES OF ARCHITECTURAL DESIGN.\*

By the Late G. F. BODLEY, A.R.A.  
 of those principles and characteristics of architec-  
 tural design which I would bring before you to-night  
 refinement, concentration, true use of detail, sym-  
 eonomy of material, contrast, avoidance of extra-  
 of manner, suitability, harmony, colour, work  
 on that of the past, consonance with nature, lastly

### *Refinement in Design.*

if there is one principle in the practice of archi-  
 in the present day which is chiefly wanting, it is  
 of refinement of design. What is the history of  
 tural art but the history of refinement in the art?  
 as the one principle that led on from century to  
 from style to style, but that of a true artistic  
 —the desire for refinement? Nature, our great  
 ever stops in her refinement. We cannot gauge  
 uite delicacy of nature, nor her redundancy of life  
 variety. Now it is in refinement for architectural  
 at this expression of life is chiefly shown. Accord-  
 e material and means at command, there should be  
 ful expression of artistic power to bring out to the  
 the expression of life. This expression is a great  
 e of all art, and one to which limits can hardly be  
 l. It should animate all your work. Every detail,  
 as in the carving of natural ornament, however  
 onalised, but in architectural mouldings and the  
 ould express this, which is the highest gift of  
 life. You see it in all good architectural work, in  
 nching vault, and the graceful clustered column  
 hich it springs; in the steady, sturdy, but thrusting  
 ; in the varied modelling of carved ornament, or  
 the mouldings of a cornice or of a string-course.  
 er in architectural work is endowed with the ex-  
 of death is bad art. Good art, on the contrary,  
 mbued with the expression of life.

### *Concentration of Ornament.*

her principle is that of concentration of ornament,  
 ly for our larger buildings. It is one too much  
 d in modern architectural works. For the enjoy-  
 richness and beauty of ornament there should be  
 designed concentration of it. The eye wearies of  
 mind fails to be interested with, a monotony of

richness. Design your building in good proportions—that  
 is, with the proportion that has an expression suiting the  
 character you wish to give your work. Then enrich the  
 chief and most important parts with carefully-designed  
 ornament, rather than sprinkle the whole with it. Here, of  
 course, the scale of the building dictates the character, and  
 it is no fault for a small one to be enriched all over; it is,  
 as it were, a detail itself. The surrounding buildings  
 may give the necessary effect of contrast, but for large and  
 monumental works you will find this concentration of orna-  
 ment a sound and judicious principle. It is one of the  
 characteristics of the best old buildings.

### *True Use of Detail.*

Another principle is that of the true use of detail. Now  
 the use of detail is not so much in order to show variety, or  
 beauty of design, but that it may enhance the expression,  
 whatever that may designedly be, that is to be given to the  
 whole building. It is surprising how the use of detail,  
 skilfully dealt with, may add scale to a building and enhance  
 its general effect. It is a great but manifest error to sup-  
 pose that by boldness of detail you make your buildings  
 look large. The reverse is eminently the case. This is  
 obvious. Nevertheless, much modern Gothic work, and not  
 work in that style alone, has been ruined in effect by  
 largeness, if not coarseness, of detail. When your mould-  
 ings are large their curves should be especially delicate and  
 subdued. The delicacy of the shadows prevents the effect  
 of any coarseness. Not that it is only detail which, care-  
 fully used, gives scale to a building. The multiplication of  
 parts is an arrangement of much use for this purpose. You  
 know how skilfully this was done in Mediæval and in  
 Renaissance buildings. The study of the best designed  
 ancient works will make the intention very apparent. It is  
 a point, again, that you can work out for yourselves in  
 studying such buildings. Compare, for example, Milan  
 Cathedral with our Westminster Abbey, or with York  
 Minster or other great Gothic churches. To give scale by  
 breaking up a wall into stages, as by arcades and the like,  
 is of frequent occurrence, and is of much effect.

### *Balance in Design.*

Another principle on which I would touch is that of  
 symmetry or balance in design. It is one for the most part  
 applicable and of chief use for large buildings and those of  
 monumental character; nevertheless, a house of moderate  
 dimensions, planned on a symmetrical arrangement, may  
 have a repose and a dignity fitting many sites. Our large  
 Elizabethan houses owe much of their effect externally to  
 this arrangement. It is not a Gothic idea; nevertheless,  
 even for this style, a forced irregularity is always to be  
 avoided. There is no plan for a large house, standing by  
 itself, more dignified and quiet in effect than one with three  
 sides of a quadrangle—the entrance, with its high porch,  
 marking the centre, and bearing, it may be, an enriched  
 panel with shield and other sculptured ornament. The  
 two projecting wings may be of more or less projection, as  
 circumstances dictate. In these symmetrical designs occa-  
 sional variation from exact balance may well be brought  
 in, as in the somewhat varied positions or sizes of windows  
 and the like. The general balance may be kept, but, like  
 an unexpected note in music, the variation in no way  
 destroys the general effect of harmony. Symmetry of  
 design denotes care and pains on the part of the designer.  
 It is a courteous manner and has much to recommend it.  
 Certainly it is a principle founded on nature. It was in  
 constant use in old days.

### *Economy in the Use of Material.*

Another point is that of a nice economy in the use of  
 material. It is again another point of refinement. The  
 almost brutal strength and ponderous use of material on  
 the Egyptian work, especially as in the Pyramids, has an  
 unpleasant sentiment. Contrast this with the great Gothic  
 buildings in which (with no economy of thought or of skill),  
 through delicate ribs of curved or straight stone, the weight  
 of the hanging vault is held, as if by magic, and passed  
 down into the ground—all with the nicest economy and  
 without any undue waste. Each member does its work. It  
 is Christian liberty and carefulness contrasted with Egyptian  
 slavery and its waste of power. Roman work had some of  
 this Egyptian-like waste. Engineers make their nice calcu-  
 lations of less and more, and tell us this or that "will stand."  
 But good architecture is not only "built to stand"—it is  
 built to last from generation to generation. It is no waste  
 to build in such a manner that the eye and the mind are  
 satisfied that centuries may see the building as we see it  
 now: that if but properly tended, and not cruelly dealt with

by the more ruthless hand of man, the gentle, slow, natural decay of time will leave the inheritance well nigh untouched. Such strength, combined with a nice economy, should be our aim in designing buildings.

#### *Contrast.*

Another principle is that of well-contrasted work. In all the best architecture you will find noble simplicity of design, due breadth of surface, contrasted with delicate detail. Neither has its full value without the other. How well the delicate Gothic traceries and niche work, and the lines of the richly carved cornices, contrast with the broad surfaces of the massive buttresses and the smooth ashlar of the walls. It is thus in nature you may see the delicate foliage and the fragile flower contrasting with the buttress-like rocks, smoothed by the hand of time. Some of the best effects of Gothic work are obtained by the use of thick walls and small detail, as in windows where the broad splay is finished by a slender shaft, giving a fine line of light and a delicate shadow, contrasting with the uniform light on the wide breadth of surface of the splayed jamb. Here, again, you can work out this principle for yourself in many ways, both as shown in examples of the past and in designing new buildings or their details. In many churches in the south of France we see the capitals throughout, both large and small, elaborately and richly carved, while the rest of the building is of the sternest simplicity. The capitals form, as it were, rich bands, contrasting with the plain walls and piers. Again you will find that the whole practice of mouldings is derived from the sense of contrasted light and shade. Vigorous, at times even harsh, as in some early Gothic work, the system of mouldings became gradually refined to the most gentle gradations of light and shade, the simple roll moulding eventually turning into what is termed the "wave moulding" with the most delicate effect of light and shade on its surface. Or, again, in carved work of the great times the delicate lines of light on the ridges and the edges of the ornament, the half shadows, tender and slight, on which the ornament seems, as it were, to rest, then the sudden deepening and darkening of the background, to throw out in strongest contrast the chief points of the ornament into greater light, to rule over the rest. Well considered and ably executed, contrast is seen everywhere, full of tender grace or decided vigour. The carver has delighted in the effect nature affords everywhere, where there is light to see its subtlety. It is our loss that here, in England, our dark days are so frequent. The want of light has, no doubt, a depressing effect on art. Let us the more carefully enlighten our mind's eye with the thoughtful contemplation of the works of other and sunnier countries and of brighter days of art.

#### *Exaggeration of Design.*

Another suggestion that I would make is a negative one—the avoidance of extravagance of design and manner. For example, avoid extravagant proportions. One has seen too much of this of late in Gothic work. A shaft only two or three times its diameter in height is surmounted by a capital out of all proportion to that shaft. It is an ugly affectation and in no way commendable. It is an exaggeration that becomes a caricature of good art. There is one kind of strongly-marked proportion, however, that we need hardly fear to carry out in these days—I mean that of considerable height. The controlling exigencies of economy too often prevent our churches, for example, from rising into stately and inspiring proportions. You know the high proportion of that, perhaps the most beautiful of all Gothic churches in the world, Westminster Abbey—the most beautiful as regards the architecture of the interior. The proportion of Westminster Abbey, that of three squares, is excellent, and without any undue exaggeration of height. The extravagance of manner I have spoken of more often lends itself to stumpy proportion, without grace or beauty. It is, like other extravagances, to be avoided.

#### *Suitability to Position.*

Another principle I would bring before you is to suit your design to the place it is meant for and to the surroundings among which you are to build. With our old buildings in the country one sees an instinctive harmony with the sentiment of the aspect of the natural scenery, or, it may be, a wise contrast with it. It was not apart from this refined feeling that for an old Gothic church, built among hills, you will generally find a low broad tower, with an affinity for the masses of surrounding scenery; while, on the other hand, on the long, low, level lands the

pointing spire will have been lifted in contrast to the horizontal line of the plain, a point of relief to the traveller's eye may rest on as he travels through the monotonous level country. In towns you may take some way, to assimilate your building to those of the neighbouring ones of former times, if there be any of interest to command such respect. It is to our loss in many towns in which we may have to build are designs of any character with which we can harmonise. Nevertheless, it should be done where possible, not in the use of local material but in designing in the manner and in harmony with the surrounding buildings. One sees examples of what we must call "bad taste" in this way. The surroundings have been ignored here let me say that we need not go abroad to find in which to design buildings in England. Let us take the "genius loci." Both in Gothic and Renaissance buildings among us there has been too much copying of manner unwisely imported from the Continent. English architecture is second to none on the Continent for beauty and poetry of design. If abroad the architect is more grandiose, yet it often lacks the refinement of the poetry of sentiment of our English work. "Thou speaks the tongue of every clime," yet, in a sense, we have a patriotism in our art.

#### *General Harmony.*

Another principle is an obvious one—that of harmony, not only of style, but of character and feeling throughout a building. No eclectic school, which mingles styles haphazardly, will ever be long lived or successful. There is if not one of continuous discord, affords but one of harmony. It is true that certain styles, as Gothic, are themselves to strong construction, while Renaissance is more consonant with great richness and delicate detail, as, for example, in plasterwork and the like. There is a risk of discordant character. It is better to attempt any such mingling of styles in a new work, however good the effect of different styles combined may be in an historical building, which has been so from time to time. The mind is satisfied with an historical building, but it is irritated by the less conceit of combined styles in a new one. Look at any complete work of the great periods you will find that they have a unity of feeling and a breadth stamped upon them. Look at our abbeys of Westminster and Tintern. I mention these, for you know them. The same character is given to the whole building to a marvellous degree. Each building expresses, in its distinctive manner, the sentiment desired, and the true artistic breadth of effect and of idea. You find this so in all complete buildings of the great periods; they are interpenetrated with one idea, though there is the utmost variety of detail.

#### *The Use of Colour.*

Another and an important part of an architect's work is connected with colour, whether in the use of marble in constructional colour, or in painting. A fine eye for colour is a natural gift, as much as a fine ear for music. The love of good colour may, no doubt, be caught by teaching of nature and the great schools of painting, those of the fourteenth century and later on. It is poor the architectural character of our houses if the beauty of colour may be obtained for our rooms. It is not enough intelligent interest spent on the subject to get the decorative effect of our houses. I cannot but express my hope that they may be made more beautiful in colour, so that our rooms may show, not only a jumbled collection of old things, however beautiful these may be in themselves, but that intentional design and harmonious architectural character may be given to them.

In the modern decorative treatment of rooms, even of some dignity, one too often sees mistakes of an evident kind. For example, it is the frequent practice to colour the cornice of a room as if it were the ceiling; so if the ceiling is white the cornice is also, though the walls and woodwork be of colour. Surely the cornice is the crown of the wall, and not of the ceiling. The architectural value of a cornice in a room is to soften off the harsh line that we get with projecting moulding. This effect is obviously lost if the cornice is coloured like the ceiling and not like the wall. I would just say, before quitting this part of our subject, that while we now often see "dados" introduced, the frieze is too seldom adopted; yet it is a far better way to have a well-designed frieze and no dado rather

to and no frieze. The frieze, and not the dado, is the right arrangement. Let me say, in passing, that we do better, in our domestic work, to follow the Renaissance rather than that which is called "the French manner," and which is a very inferior manner at this time, there is a fashion for a papered dado. This is done with undue prominence the poor, thin line of the dado. Now, this dado moulding, or "chair rail," is the cornice of the dado, and the whole should be of the same colour. Above this dado moulding there should be wall-paper of good pattern and colour. Such a wall-paper is best when it is of two or three shades of the same colour and the spotty and unarchitectural effect of a patterned paper is avoided. Wall-papers were formerly of damask silk hangings, which were usually of one colour, or different shades of the same colour. These are now called tapestries, it is true, but the successors of tapestry of the present day, but the pictured scenes of tapestry take one kind of pattern and altogether different kind of decorative effect. There is nothing in common with tapestry in them, but both are for the clothing of a wall. Again, one of the most palpable mistakes of colour, such as the use of "pointing" of brickwork. We need not add to the ugliness and dinginess of our buildings by its use. But I would chiefly urge on this subject is, that you should not use decorative art in any way beneath your serious work. Here, again, look at the works of the past, of the best of Europe. They will be of more use to you than the imitation of Japanese or Chinese work, the fashion of which, however ingenious it may be.

*The Study of the Past.*

principle is the [founding designs on the  
 the past. Sir Joshua Reynolds said:—"The  
 nsive your acquaintance is with the works of  
 have excelled, the more extensive will be your  
 invention, and, what may appear still more like  
 the more original will be your conceptions."  
 think, eminently true of architectural design. You  
 found your design on some previously executed  
 has won your respect and admiration ; but you  
 your own, your mind's eye seeing it, thus or thus,  
 wholly altered, from that which produced the  
 s thus that art hands on in the tradition of art  
 of it, which is immortal.

*Consonance with Nature.*

er principle is that of harmony and consonance. We have incidentally spoken of nature as the all art. It should be eminently so with the art of architecture. Though our art, like music, is imitative one, yet its characteristics should be those of the spirit, though not in the letter. It is the delicacy, the refinement and the richness, the great attributes of nature which we should embody in our works, rather than any exact

*Truth.*

th as expressed in architecture much has been  
d written well, more especially by Mr. Ruskin, to  
ching we owe so much in the whole field of art.  
essential element of good art. I need not dwell  
rt of our subject. Nevertheless, what are many of  
street fronts in the City, and other buildings else-  
ring around us, but examples of most untruthful  
re? Iron columns and iron girders are concealed  
columns and thin stone friezes and the like  
s. It is an unpleasant, and indeed a wretched,  
building, without truth or dignity. Should a fire  
ture of the work, the writhing columns and the  
girders will soon show that they are found wanting  
st necessity of good building—stability—and the  
will be manifest.

GOW INSTITUTE OF ARCHITECTS.

At the last week, Mr. James M. Monro, president, in the following were unanimously elected Fellows of the Institute, viz.:—John M'Lintock Bowie, 53 Buccleuch Street; Hugh Campbell, 156 St. Vincent Street; James Thomson and David Salmond, both of 225 St. Vincent Street. It was reported that Principal MacAlister, of Glasgow University, had accepted the honorary membership of the Institute. The president, Mr. James M. Monro, and Alexander Wingate, chairman of the Associate

Members' Section of the Institute, have been appointed representatives on the committee supervising the work of architecture in the Technical College, and Mr. T. L. Watson was reappointed governor. The Institute was approached by the Glasgow District Council for the National Registration of Plumbers regarding the appointment of representatives to that Council, and Mr. H. K. Bromhead was appointed. It was reported that the Institute's prize for measured drawings in the Technical College had been awarded to Mr. James H. Swanson, Bishopbriggs. It has been proposed to celebrate the union of this Institute and the Glasgow Architectural Association, and that the function should take the form of a dinner.

VICTORIAN GOVERNMENT'S OFFICES.

THE improvements committee of the London County Council report that they have been in negotiation with the architect acting for the Government of Victoria as to the elevation of the buildings to be erected on the site, leased to the Government by the Council, at the junction of the Strand with the east spur street between the Strand and Aldwych. Several designs were submitted, but, having regard to the importance of the site and to the effect which the elevation of the buildings erected thereon will probably have on the design of the buildings to be erected with a frontage to the Strand on the remainder of the crescent site, they did not see their way to recommend the Council to approve any of the designs. Mr. R. Norman Shaw, R.A., generously offered to assist the Council, and prepared a sketch design which the committee and the architect acting for the Government of Victoria both approve. Mr. Norman Shaw has declined to accept any fee, and the case therefore appears to them to be one in which the Council would wish to accord its thanks to Mr. Norman Shaw for the services which he has so generously rendered. The general purposes committee concur in the proposal, and it is recommended:—"That the thanks of the Council be accorded to Mr. R. Norman Shaw, R.A., for the services so generously rendered by him in connection with the design of the elevation of the buildings to be erected on a site in the Strand leased by the Council to the Government of Victoria."

AYR AULD BRIG.

AT the last meeting of the Ayr Auld Brig preservation committee Mr. Wilsou, the engineer, and Mr. J. A. Morris, architect, Ayr, explained the state of the works and the progress made. The engineer reported that no great difficulties had been met with, that the work was progressing satisfactorily, and that the recent great floods had not affected the stability of the bridge. A letter was submitted from Mr. Alexander Simpson, engineer, Glasgow, who had been offered the appointment of honorary consulting engineer, stating that he was unable to accept the appointment. The treasurer reported that the donations to the preservation fund amounted to 10,417*l.* 17*s.* 10*d.*, and that the total expenditure to date on preservative works amounted to 1,199*l.* The honorary secretaries reported that the treasurer had received from the Edinburgh fund 637*l.* 5*s.* 1*d.*, and that the secretary of the Glasgow fund had intimated that they had over 800*l.* in bank, which would be shortly transmitted. Mr. Dunlop raised the question of the desirableness of retaining the present undulations of the south arch, and also of the parapets, which have for so long been a feature of the bridge, and inquiry was made of the engineer, who was called in, whether it would be necessary to take down the whole of the parapets. Mr. Wilson stated that parts of the parapets would have to be taken down, but they would not be taken down where it was considered unnecessary. Mr. Morris reported that in his opinion it was desirable to take down the old gutter and gargoyles, and that the replacing of them would be interfered with only if they were dangerous. The committee approved of the suggestion, and expressed their desire that in view of the great antiquity of the structure, the present undulations should be retained in every respect so far as possible, and the hope was expressed that the Town Council of Ayr would concur in this.

**At a Meeting** of the Royal British Colonial Society of Artists the following were elected members:—Terrick Williams, Talbot Hughes, Russell Dowson and H. M. Rheam, R.I.

## NOTES AND COMMENTS.

THE case of DAVIS *v.* Mayor, &c., of Bromley, which recently came before the Court of Appeal, raises and decides a point of some interest to architects and builders. The plaintiff had submitted plans to the local sanitary authority for draining his house and for a proposed addition thereto. The defendants refused to sanction these plans on the ground that they did not comply with their by-laws. The plaintiff therefore brought an action against the defendants, the sanitary authority, for a declaration that he was entitled to proceed with the proposed work and for damages. The ground of his action was that the defendants had maliciously refused to approve of these plans. He alleged that they had not honestly exercised the discretion of approving plans which the Legislature had vested in them, but that they had some spite against him arising out of some previous litigation, and hence it was his plans had not been approved. It is clear law that if the Legislature has vested a discretionary power of this nature in a public body, and if that public body has honestly exercised that discretion, their decision cannot be questioned. They may have acted unwisely or wrongly; but if they have honestly done their best to come to a decision they have been acting in accordance with their powers and no tribunal can question that decision. The important question of law raised in this case was the question whether the presence of some oblique motive would give the party aggrieved by an unrighteous decision arrived at from such motive a right of action for damages. The Court of Appeal held that, even if it were proved that a public body had acted under the influence of such a motive, no such action would lie. They therefore refused to go into the question whether or no the defendants in this case had acted as the plaintiff alleged. They held, in accordance with previous decisions, that if the plaintiff could prove the facts which he had alleged, his remedy was not an action for damages, but an application to the King's Bench Division for a mandamus to compel the local authority to hear and determine properly his application. As the Court pointed out, the question whether or no a mandamus shall be granted is a matter for the decision of the King's Bench Division, whereas the question whether malice has been proved in a civil action for damages is a matter for the decision of a jury. It cannot be doubted that upon a question of this kind, which involves a consideration of the conduct of a public body, the King's Bench Division is a far fairer tribunal than a jury, composed, it may be, either of sturdy supporters or sturdy opponents of the authority upon whose conduct they would be asked to adjudicate.

WE have already referred more than once to the dispute between the Corporation of Waterford and the Commissioners of Waterford Bridge. The bridge is constructed of timber, and it is considered to be inadequate for the traffic; moreover, as it has existed for over one hundred years, the material is not throughout as sound as is desirable. The Corporation are eager to erect a new bridge; but the Commissioners would not agree without compensation, and much litigation followed. Finally, the amount to be paid for the bridge and its tolls was left to arbitration. The sum in the award was 63,000*l.* Neither side was satisfied. Among the witnesses was Mr. MAX AM ENDE, who said that a ferro-concrete bridge such as the Commissioners proposed was unsuitable. The length of time the material had been in use was not sufficient to enable him to determine the durability of the system. The Lord Chancellor, who presided at the meeting of the Judicial Committee of the Privy Council who heard the appeal, came to the conclusion that there was no ground for disturbing the decision of the arbitrator, save as to the costs. As regards the costs, they would refer

the matter of payment to one of the officers, and when they had received his report would include those costs in the order. There would be no costs of the appeal on either side. The case is remarkable. The bridge is not adapted for heavy traffic, and a steel bridge would cost 50,000*l.* at least. The owners of the bridge are not prepared to expend that sum, and believe another bridge could be erected for 19,000*l.* But such is the state of affairs that a structure on which 1,000*l.* a year has to be expended, and which requires double that outlay to be safe, will involve the people of Waterford an expenditure of 63,000*l.* in addition to the cost of the bridge, while not one cubic foot of the existing bridge will be of any use to them, for it all must be replaced.

STUDENTS of political economy may remember discussions concerning the value of peasant property, and how CHARLES KINGSLEY prayed "that the angels of civilisation would defend us from it." The system was supposed to be exhibited under its most favourable aspects in France, although ARTHUR YOUNG, who was one of the earliest of its opponents, had to admit that even among the dunes "the magic of property had turned sand to gold." Of late years the subject has assumed new importance, for, in addition to agriculturists, small scale, France now possesses owners of land and workmen in towns. According to an American writer there are in all more than eight millions of proprietors of the soil. When the United States Immigration Commission recently visited Marseilles it was found impossible to ascertain "the average price of land" in that locality, because no transactions ever took place other than by inheritance. Although it is difficult for working men to own real estate in Marseilles, where there is an excellent penny street car service, outlying property is being bought up by families in modest circumstances. There is a local custom among poor men who feel that they must reside in the city of buying an outlying plot of ground and erecting thereon a "cabanon" of two or three more rooms, where they spend Sunday and holidays. There are settlements where hundreds of these houses are to be found, each with a bit of garden, deserted throughout the week and scenes of great animation on Sunday; the most intense rivalry existing to have the best garden or most attractive "cabanon" the day terminating in a reunion, where poetical recitations are listened to, songs sung and sports made.

WE hear a great deal about the obligations of this country to the colonies, but it is not so evident that reciprocity is recognised. The late Mr. SEDDON, New Zealand premier, was more honoured when he appeared in England than if he were some minor potentate. It might therefore be supposed that if it was arranged to erect a technical college in Australia as a memorial of him, British architects would be expected to compete for the designing, that is, if the consideration there were no architects in New Zealand who were competent to undertake the work. Strange to say, American architects alone were invited. Two prizes of 500 dols. and 200 dols. were offered. The first prize was awarded to Mr. TRUMBULL of Philadelphia, and the second to Messrs. SMITH and GROBEN, of New York. There are many competitors in this country for technical colleges, and we need not therefore envy the American architects. But there is no doubt a slight was intended to be offered to the colonies, and on that account the incident deserves notice and remembrance.

## ILLUSTRATIONS.

KINGDOM PROVIDENT INSTITUTION, STRAND, W.C.—  
DANCE LOBBY—MARBLE STAIRCASE—LAVATORY—UPPER LAND—  
GENERAL OFFICE—THE BOARD-ROOM.

THESE new buildings have been erected for the United Kingdom Provident Institution opposite St. James Danes Church, in the Strand, and they were formally opened by the Chancellor of the Exchequer last July. The façade is of Portland stone with a base of grey green granite. Some controversy has taken place in connection with the figures which are carved upon the building. Those on the mezzanine represent "Justice and Truth," "Temperance and Industry," and "Security and Industry;" and the figures (first-floor window), "Prosperity," and "Fortitude" (turret) "Watchfulness" and "Benignity," all by Mr. HENRY POOLE. The other ten figures are by Mr. J. H. JACK, and represent "Faith," "Hope," "Wisdom," "Justice," "Temperance" (2), "Truth," "Chastity," "Industry," and "Industry." The effect of all this sculpture is somewhat to overcrowd an otherwise fine example of London street architecture. The main entrance is in the centre of the frontage, and has a recessed porch with bronze sliding gates, and the outer doors are also decorated with bronze. On entering, some excellent mosaicwork by Mr. DUDLEY FORSYTH will be seen in the vaulted ceiling of the hall, and facing is a representation of St. GEORGE and the Dragon, designed by Professor MOIRA. The walls are lined with some fine examples of Cipollino marble from the well-known quarries of the Marmor Company, and supplied by Messrs. H. T. JENKINS & SON. Throughout the building will be found some of the finest specimens of marblework in this country. They are a special feature by the architect, partly with the view for effect and so for the durability of the decoration and the fireproof safety of same.

The general office has been planned circular, divided into eight bays by large monolith pilasters supporting a cornice and cornice, from which spring the arch ribs forming the cornice in the dome, all of which has been executed in Greek Cipollino marble; the wall spaces filling the bays being of violet Cipollino, above which comes the beautiful sculptured frieze, mounted on a background of Pentelicon statuary executed by Mr. J. H. JACK. The same scheme of marble decoration is repeated in the entrance hall, the openings being particularly handsome. The staircase leading to the first floor is treated solely in marble, with a Pavonazzo and Greek Cipollino being used for the walls, the ceilings here even being in marble, Swiss marble Cipollino bands being used with panels of light marble. In the first floor hall the marble treatment has been used to the richest effect, as here the mouldings, pilasters and columns are in Verd Antico marble, the ceilings being of antique Swiss Cipollino, which combination is most pleasing. The pilasters contain inlays of the most costly Princess Blue, which is the precious Sodalite of Canada, so named after the Princess of WALES, who was instrumental in discovering it. The marble here is worthy of note as it is very handsome in design and colour, the marbles used being Verd Antico, Italian Pavonazzo and Siberian green. All the more pleasing to inspect this work with the knowledge that the greater part of it has been executed by British labour at the factory of Messrs. JENKINS & SON, marble merchants, of Torquay.

The woodwork throughout the building is of most excellent quality. The most striking is probably the billiard-room, the panelling of which has been carried out by Messrs. W. AUMONIER & SON, of London, who have executed the panelling in the managing director's office adjoining and the smaller rooms on the same floor. The lifts have been supplied by the Otis Elevator Company, the general bronzework by Messrs. J. H. JACK, GARDNER & Co., the leaded lights—of which there are some fine examples—by Messrs. R. F.

PEARSE & Co., and the electric lighting by Messrs. STRODE & Co. The sanitary fittings were supplied by Messrs. JOHN BOLDING & SON, the skylights by Messrs. HEYWOOD & Co., the metalwork by Mr. F. LYNN JENKINS, the constructional steelwork and fireproofing by Messrs. WM. LINDSAY & Co., all of London; and the locks by Mr. N. E. RAMSAY, of Birmingham. The architect is Mr. HENRY T. HARE, F.R.I.B.A., and the builders Messrs. HIGGS & HILL, LTD.

### TOROUGH OF BIRKENHEAD CENTRAL PUBLIC LIBRARY.

THE accompanying design has been selected in competition by the assessor, Mr. CHARLES HEATHCOTE, of Manchester and London, who was appointed by the library committee. The Town Council have also accepted the assessor's award, and the approval of Dr. CARNEGIE has been obtained. It is anticipated that the contract will be let in the course of a few months.

The site for the proposed building is an irregular shaped plot of land centrally situated, surrounded by three streets, with the main entrance facing the most important thoroughfares, namely, Chester Street and Market Place South. Owing to the fall of the ground and the varying levels of the site, which has been partly filled in with debris, the disposition of the building on the land has been decided with due regard to economy of building on a sloping and peculiar shaped site. The building line fixed by the Corporation permits of the new library having an ornamental forecourt, with footpaths and shrubbery which will enhance the appearance of the building when completed.

The design is externally treated in a suitable architectural character, English Renaissance being the style adopted by the architects. The main corner and side elevations are effectively grouped in a dignified manner, forming a harmonious public building worthy of such an important site. Internally the planning is most compact, well arranged, balanced and economical, and fits the site. A feature of the scheme is the abundance of light, air and ventilation which is provided, also the facility for easy working and perfect supervision. Every public reading-room is cross-ventilated, and each room has windows on both sides, creating an air cross-current (without draughts), and preventing any stagnation or stuffiness in any portion of these rooms. Ample means of egress have been provided for the public from the lecture hall and first floor by two separate stairs, with spacious crush hall, all leading to separate streets. The staircases are of easy gradient, the steps regular in number, in short flights, and have ample landings. The internal arrangements and fittings embody all the latest ideas which have been considered worth adopting from similar buildings recently erected in different parts of the country.

All the materials in the internal and external work in the various trades would be suitable to the demands and character of the building. A natural system of ventilation will be adopted throughout the library, with forced extraction by an electrically driven fan for all the public reading-rooms and lecture hall, so as to prevent stagnant air. Apart from open windows and doors, provision is made for a copious inflow of fresh air and also for the outflow of foul air from the highest and warmest point in the various rooms. Both the natural and artificial means suggested for the various sized rooms are under the control of the officials or hall porter, and the fittings will be so placed and specially devised to prevent any tampering by the public. The artificial lighting is by electricity, and all cable wires, &c., fully protected and easily accessible for repairs.

Low-pressure hot water has been adopted for the heating, being the most economical to work, and owing to the low temperature of the water in the pipes is by far the healthiest to adopt in a building where the public are likely to be gathered in considerable numbers for any length of time.

The total estimated cost of the building, including drainage, heating, ventilating, water, gas, electric light and sanitary appliances and all joinery, permanent fittings and fixtures, ordinary painting, complete and ready for use but exclusive of architects' fees, fees for quantities, lithography and printing, clerk of works' salary and the cost of portable furniture, is not to exceed the sum of 13,000*l.* A 5 per cent. margin over the foregoing sum is allowed according to the conditions of competition. The architects are Messrs. W. EDWARDES SPROAT & ELTON WARWICK, 25 Lord Street, Liverpool.

### TRINITY HOUSE, WORCESTER.

A CHURCH House was opened last week in Worcester in which what remained of the Avenue House forming a part of the Trinitarian monastery was incorporated. The Bishop of Worcester read the following paper on the occasion:—

The church of St. Nicholas is a rectory in the patronage of the Bishop of Worcester, and, according to Dugdale, the first church on the site was built on the return of our countrymen from the first "Holy War" about A.D. 1100, and was dedicated to St. Nicholas—the celebrated patron of the time in all dangers, especially at sea—and through whose intercession the citizens believed they had escaped shipwreck. The old Trinitarian foundation, which was also established in the parish of St. Nicholas by the citizens, consisted of brethren and sisters of the Order of the Holy Trinity, founded by St. John de Matha and Felix de Valois about the year 1197 and confirmed by Pope Innocent III. The Trinitarians or Methurine Friars were brought to England A.D. 1224, and there were eleven houses of the order established in England. The site of the Worcester Friary was in the parish of St. Nicholas and near to the Old Trinity Hall, the remains of which were pulled down a few years ago for the widening of St. Swithin's Street. It seems probable that the property of the Trinity House and Old Bridge House also formed a part of this establishment.

The Old Trinity College, which was bodily moved to the east side of the New Trinity Street, and which latter was cut through the Trinity properties, is all that remains of the old almshouses and dwellings of the Friars on the south side of Trinity Lane; but there is strong reason to believe that the Old Bridge House, which has this year been restored, connected the buildings of the Old Trinity Hall and Friary with the house, which has also been restored, and is to be made use of as the Worcester Diocesan Church House. In the course of this restoration, and curiously coincident with the discovery of the crypt of the Old Holy Trinity Church or Chapel (beneath the site of the new bank at the end of the avenue) it has been found that a vaulted passage existed under the houses from this crypt to an entrance which had evidently been bricked up a long time ago, but which had entrance into the basement vault of Trinity House, and from thence it is not difficult to trace its probable connection through the Bridge House to the ancient Trinity Hall. It is believed that there was some very ancient stone vaultage which may have had connection underground with the rectory and dwellings of the Friars, but this has not been pursued beyond the wall at the south end of Trinity House.

In the course of excavation to examine the foundations of the house as it stood a year ago, it was found that the ancient stone foundation was of the strongest character as regards the underground walls, but that a superstructure of timber and rubble had existed before the brick house was built. The timber and rubble had gone so far to decay that it was no great wonder that the house was found to be falling over (both back and front) so far out of the perpendicular that the high walls of the central hall had split up from top to bottom on both sides, and at some time (not revealed when) the house had been tied together with iron bands passed right through the building from front to back. On removing the old papers from the walls these fissures were discovered, and also that the stone staircase had parted from the walls and the landing, and was merely supported on itself and two small iron pillars which had been introduced to prevent the total collapse of the staircase.

On removal of the wooden dado it was also found that the inside wall was timber and rubble, and it is clear that when the extension of the hall was made and the stone

staircase was erected, probably 200 years ago, it was the outer wall and the extension which was brick thro out. The walls have, in fact, been built on the old tim which, especially on the whole length of the frontage, reduced to such decay that they crumbled to dust on b handled. Hence the work of restoration has necessi underbuilding all round and very extensive rebuilding the walls. The roof beams were mostly solid, and of the door joists good; but the floors, though in cases of oak, have tried the patience and tools of repairers to a serious extent. It will be seen that n all the back of the house and outer buildings are ent new built.

The design for the house to increase accommodation happily had the effect of efficiently buttressing up the walls, and has enabled the decay of ages and damp dark of the cellarage to give place and opportunity of util much waste space there. Some little license has been taken in the restoration of the Old Bridge House, wherever possible the old timber remains are brought light out of the coats of old plaster which have been da on during centuries to hold the structure together. I hoped that this little "Chamber on the Wall" may happily utilised as the chapel of the restored Old Trinity House.

It should also be made known that the name "Avenue House" has been found to be only modern. An old map of the sale of the property a hundred years ago names it distinctly as "The Trinity House," and old letters in possession of a family whose ancestor owned it 150 years ago are also dated from it as "Trinity House." Most of the old deeds in existence merely allude to it as "Capital Mansion House." It may be of interest to that in making a place for some pipe-laying under offices from the Avenue to Trinity Lane, some decay remains were found of the old wood-piping used as a conduit for the supply of water to the city from Henbury Hills to the old reservoir still existing in the Trinity Lane. Also that no less than three old wells have been found in the vaults, giving additional ground for the supposition that these vaultages served some other purpose in the old days than mere cellar foundations to the houses. In troublous times they were doubtless used for concealment and large storage.

In excavating to the foundations some few evidence of burials have been found, but beyond a small piece of Roman paving and some bottles which were found but some feet deep no "treasure" has been discovered. New Trinity Hall needs no comment, as it has been merely built with all the other new buildings adjoining the old house since this time last year; but the foundation on one side was happily discovered to have been planned on the exact line of a very substantial old foundation wall. An old map of the property discloses that at one time there was a garden wall dividing the kitchen garden from the flower garden, but this hardly accounts for the great strength of the foundation, which may have been in use in the past and probably was a wing of the house or some other building.

### IRISH THIRTEENTH-CENTURY FORTRESSES

MEMBERS who joined the excursion to Athlone had the opportunity of inspecting the castles of Clonmacnoise and Roscommon as well as that at Athlone. The present writer also visited the neighbouring mote near Moynalty Temple, in the parish of Ballyloughloe, county Westmeath, and examined the castle of Rinnduin or Randown. The five sites exhibit in their several ways good examples of successive thirteenth-century fortresses.

The mote at Ballyloughloe, which, indeed, may have been constructed before the close of the twelfth century, is a typical Norman earthwork, fashioned out of an earthen ridge, and apparently untouched since it bore its wooden tower and wooden palisades. The foundations of a stone wall 8 feet wide may, indeed, be seen running up the slope of the mote, but this was probably to support the bridge which connected the "tower on high" with the bailey. On a hasty view, at least, I could see no other signs of a stone building. The mote is very steep and lofty, and the fosse surrounding it and connecting with the fosse round the shield-shaped bailey to the west is about 30 feet wide. The east a crescent shaped bailey was formed by cutting

\* From a paper by Mr. G. H. Orpen in the *Journal of the Royal Society of Antiquaries of Ireland*.

western extension of the esker by a strong rampart and  
Further to the east lies the nearly dried-up bed of  
Lough. The Irish name Baile locha luatha means "the  
of the lake of ashes," or "of the dried-up lake."  
Loughloe, i.e. the Anglo-Norman fortress, was burnt by  
O'Connor in 1234.

The castle of Athlone, first built in stone in 1210, shows  
original mote revetted with masonry, and bearing a  
contemporary keep or donjon.

The castle was erected at Clonmacnois in 1213, but the  
remains of stonework appear to me to be of later  
date. The castle is mentioned as a royal castle up to  
1234; but then it seems to disappear from the records,  
suspect that only the earthworks date from this  
time.

The keep, whenever it was built, was placed on  
mote, and outside the small stone ward may be seen  
original bailey, enclosing a much larger area, surrounded  
on three sides by a large fosse, into which the waters of the  
river were probably diverted. The scarp of the ditch has  
been rampart. Round the mote on the landward side the  
of the fosse is on a higher level, and probably the water  
never conducted here. As an extra defence, however,  
the underscarp of this ditch bears a lofty rampart. From  
great lumps of disjointed masonry that lie scattered  
and from their positions, it seems quite certain that  
the keep was blown up by gunpowder, so it probably  
did not survive until the sixteenth century. It is clear, however, that  
there was no royal castle here even in the latter half of the  
fourteenth century, or we should have some mention of it  
in the records. The castle, like the monastery, was built at  
the end of a long esker ridge, with low marshy land to the  
west and south. The river is deep at Clonmacnois, and  
never could have been a ford here, but in 1158 there  
was a wicker bridge. Perhaps the mote castle was erected  
to guard this bridge and protect the monastery, otherwise  
it is not easy to see what strategic purpose it served.  
Probably it was abandoned as a royal castle soon after  
1234, and possibly the stone castle was subsequently  
destroyed by a bishop of Clonmacnois. Further research into its  
history and a more critical examination of its remains may  
throw more light upon it.

The castle of Rinnduin, or Randown, first erected in  
1251, was a sort of promontory castle on a tongue of land  
projecting out into Lough Ree and included no artificial mound.  
The keep, however, is on a slight elevation, and was further  
protected on two long barrel vaults. The existing remains are  
probably in the main subsequent to 1270, when the castle  
was burned or thrown down by Hugh O'Connor, and James  
Armstrong was fined 400 marks for failing to keep it.

The ward of the castle, the work on which was tem-  
porarily suspended in 1233, has no doubt been more than  
reconstructed since. The walls are well preserved,  
and are pierced with small, nearly square loopholes.  
The entrance from the keep by the entrance archway, and on  
a somewhat lower level, is a rectangular building about  
16 feet internally, having on the first floor two large  
multi-headed windows and pierced on the ground floor  
by small rectangular loops. This was probably the new  
work for the construction of which, in the years 1299-1302,  
Richard of Oxford, sheriff of the county, was allowed  
15s. 2d., besides 20s. granted to him for superintending  
the construction. All these buildings—keep, courtyard  
hall—are closely surrounded on all sides, except  
where they abut on the lake, by a deep and wide fosse,  
which is used to be, no doubt, flooded with water from  
the lake. This fosse is also carried across the whole  
of the land in a south-westerly direction to meet the  
river in this way isolating by a belt of water not only the  
castle, but a considerable piece of land beyond, which thus  
became an island. This seems to justify and explain the  
statement in the Annals of Loch Cé (1236) that Felim and  
most went across the bádhun at Rinnduin and "over  
the ditch of the island in which all the cows of the country  
were." The entrance to the courtyard is through a round-  
headed archway of cut limestone, with grooves for the port-  
cullis, and just outside at each edge of the fosse are piers of  
masonry which probably bore the bridge repaired in  
1299. About 700 yards further to the north the whole  
of the peninsula is cut off by a wall extending from shore  
to shore. This wall is about 4 feet thick and 14 feet  
high. It has at intervals square projecting turrets  
about 8 feet internal measurement, with plain loops  
about 4 feet long and 3 to 6 inches wide; also a strongly-  
rounded gateway. Inside this wall was probably the vill  
at Randown, which is mentioned several times in our  
records, and in aid of the enclosure of which a grant was

made in 1251. The castle appears to have been built to  
command the navigation of the lake, and there were profits  
from the ferry (I suppose across the lake) at this spot. I  
have found nothing in the records to support (but much that  
seems inconsistent with) the assertion of Professor Stokes,  
that the castle of Rinnduin belonged from the first to the  
Knights Hospitallers. In 1372 John O'Dubagain, the topo-  
grapher of the northern half of Ireland, died in the com-  
munity of John the Baptist at Rinnduin. The Hospitallers  
were probably located in the vill; but I doubt if the foun-  
dation of their priory goes back, as has been stated, to the  
time of King John.

Finally, Roscommon Castle, built in 1269, and perhaps  
largely re-edified in 1278-9, is a large quadrangle, with pro-  
jecting round towers at the corners and principal gateway.  
It is purely Edwardian in plan and had no keep. It was  
restored from the O'Conors in 1569, and was afterwards  
restored to suit the times. The Tudor windows, &c., are,  
perhaps, due to Sir Nicholas Malbie, governor of Connaught,  
who got a grant of the castle, and was "a great builder"  
there about the year 1580.

Thus in these five castle sites I think we may recognise  
(1) a mote and bailey site, where the original wooden  
defences, perhaps of the time of Henry II., were never  
replaced by stone; (2) a mote which bears a nearly  
contemporary polygonal stone tower, dating from the close  
of John's reign; (3) a mote with its earthen bailey and wet  
ditch, dating from the same period, on which, after the  
lapse of some time, a rectangular keep and small courtyard  
were built; (4) a promontory castle consisting of a rec-  
tangular keep and stone courtyard, isolated by a wet ditch,  
dating in plan from the time of Henry III.; (5) a purely  
Edwardian castle, restored in Tudor times, which never  
had a keep.

## RESTORATION IN SCOTLAND.

AN "Old Glasgow Exhibition" has been held in the  
Trades Hall. One of the speakers was Principal  
MacAlister of the university. He said he did not propose  
to offer them a set discourse on Old Glasgow, its history  
and its monuments. He was too young a citizen to venture  
far on that subject in the presence of his seniors, who knew  
and loved Old Glasgow so well. A few reflections of a  
general kind were all he could fitly present them at the  
opening of that day's proceedings. They might have  
noticed that His Majesty the King had lately shown his  
enlightened interest in civic antiquity by his letter urging  
the preservation of Crosby Hall, an interesting and beauti-  
ful example of Mediaeval architecture in the City of London.  
The King recognised that it was fatally easy to destroy such  
a memorial of the past, and that it was impossible to build  
it up again. Once lost it was lost for ever. The hope of  
London seemed to lie in the munificence of a few wealthy  
men or corporations, who might be moved to preserve  
the structure in which His Majesty was interested.  
Here in Glasgow, faced with a similar problem, they ap-  
peared to have taken a better way. For the preservation of  
the ancient house from which the Society took its name  
they had relied on the many, not the few; and they  
proposed not merely to rescue the house from the des-  
troyers, but to maintain it on a wide basis of public  
support for the enjoyment of all, and the use and service of  
all. While it would stand as a landmark of the city's  
history, they had sought to invigorate the literary and  
antiquarian activities of a living Society with the grey  
traditions that clung to its ancient walls. Under their  
guardianship Provand's Lordship would not be a mere  
dead relic—venerable indeed, but unrelated to the intel-  
lectual life of Glasgow; it would become a visible and  
palpable link uniting past and present generations of  
Glasgow citizens. That aspect of their action it was  
which specially appealed to him, and he did not  
doubt that it would appeal also to multitudes of  
others who were not more professed antiquaries than  
he was. The cathedral close by would lose, for  
him at least, much of its beauty and value, considered as a  
memorial of the piety and skill of our forefathers, if it were  
left empty and unused, a mere gazing-stock for the passer-  
by. Its significance was enhanced by the fact that it was  
still made to subserve the sacred purpose to which that  
piety and skill were consecrated by the builders. Ancient  
history, whether embodied in mouldy annals or in crumbling  
stones, was apt to leave us cold unless it was brought into  
organic relation with the life of to-day and with the history  
that was being made before our eyes. But when it was

used to illustrate and exemplify the great principle of continuity which runs through life in all its ages and stages, then and then only the dead bones lived, and live men felt that ancient history touched them very nearly. The past became more than "a tale that is told;" it shed light upon the evolution of the present, and helped to explain this perplexing world, which so sadly needed explanation.

For the like reason he might confess, at the risk of obloquy from the "Anti-Scrape Society," that he rejoiced in the so-called "restoration" of the abbey church of Iona. It had long been a wind-swept ruin, gazed at by summer tourists and quarrelled over by archæologists. The inevitable processes of decay would soon have left nothing to gaze at or to quarrel over, and peace would have come when only a desert remained. Much criticism had been levelled at the manner of its structural repair; so at least his co-trustees informed him. On that subject it would be unbecoming for him, the last and youngest of them, to say a word either of agreement or dissent. But that the double purpose of its restoration was right and laudable he was persuaded. That purpose was the same as theirs—to conserve the ancient fabric by all proper means, but also to revive and maintain its serviceableness to living men. Time had been the arch-innovator; it had decayed the substance, it had obstructed the use of that temple of our fathers. That was the truest conservatism which sought to undo the innovations of time and to restore the venerable building to its venerable service. Another generation, if not the present, would be grateful for this effort of their own, when it found the tradition of that sacred site, hallowed by its memories of Columba and the early dawn of Christianity in Scotland, still alive and effectual after more than a millennium of years. The crudeness of our modern civilisation was redeemed and mellowed when we were thus made conscious of the subtle bonds of descent and inheritance that united us with the older world. To come nearer home again, it was, to his mind, a grievous loss to the community when the old College buildings in the High Street were destroyed. The visible embodiment of our academic traditions, the silent witness of our long and stirring academic history was then done away beyond recall. We were proud of the splendid pile on Gilmorehill, with its spacious courts and halls, round which in time no doubt memories would cluster like the young ivy which was here and there beginning to aspire at the foot of its walls. The new building was nobly fitted for its high purposes, as the old had doubtless ceased to be. But still the old had its spiritual value, even its educational value, for our students and graduates and citizens; and while he prized the amenity of the West, he could not but regret that so little remained to remind them of their origin in the East. Let him say, to prevent misunderstanding, that he had no thought of reverting to their old abode. He was not sorry that the houses of principal and professors now looked out on something brighter than the Vennel. He would not move a finger in the direction suggested by an American man of letters, who like many of his countrymen was strong for all that savoured of antiquity. He wrote thus to him during the summer:—"Of course you will cause the university to leave the fantastic modern buildings it at present occupies, and return into the truly venerable quarters where Francis and Rashleigh were parted by Rob Roy." No, he recognised unreservedly that the university had to flit or perish of asphyxia. But though, as he had said, he admired the grand new mansion, he wished that the old home also had been allowed to remain. It might have been adapted to some other academic purpose. It might have even kept an honoured place as the seat of literary and antiquarian fellowships such as their Society. We and our successors might still have taken "pleasure in her stones," and contemplated with profit the rock from which we were hewn. And the continuity of the modern with the early history of the university, which dignified our common life and gave it perspective, would have been more easily realised by the inheritors of its renown. Regrets like these are vain, however, unless they led us to action—such action as was still open to us, such action as their Society had taken in procuring the conservation of their eponymous abode and in bringing together that exhibition on its behalf. "Let Glasgow flourish," they said; let it flourish like the tree upon its shield. Yes, but do not forget its roots. They were worthy of solicitude, for through them the city has drawn its life from the rich soil of the ages. Principal MacAlister concluded by declaring the exhibition open and commending it to the citizens.

## ARCHITECTURAL EXERCISES.

THE subjoined exercises were offered to the students at this year's examination of the Board of Education. They will be found useful by many students. The exercises in other branches of art—viz. ornament, perspective, hand, &c.—are also deserving attention.

### Section I.

Draw in elevation one complete column with its base and entablature belonging to a Greek Doric order and a similar example of the same Roman order. The column, unless it belongs to a circular building, shall be an angle column, and the lower diameter in each case shall be 1 inch. Draw attention to any striking difference in Greek and Roman treatment of the order you select.

Make a careful sketch or drawings of a Greek Ionic capital or of a Roman Corinthian or Composite capital so as to measure at least 5 inches high; make to a scale a sketch of a single acanthus leaf from such capital, showing both a Greek and a Roman variety.

Make a section to measure at least 5 inches in height through a Roman Corinthian or Composite cornice. In addition, make sketches or geometrical drawings to a scale of one of the modillions and of one of the scrolls under the corona, or draw in section and elevation other members of the cornice each to measure not less than 1½ inches in height with the appropriate carved ornaments in each case.

Make drawings of a small Classic building or of a larger building; if not to scale, give a few of the dimensions approximately. The drawing should be sufficient to show the general character and appearance of the building, with some details of its construction, including the method of roofing it and of its mouldings and ornaments. A Greek temple or propylæum, a Roman basilica or the peristyle of a house would be suitable.

### Section II.

Make an elevation at least 6 inches in height of the front of an important church or cathedral of any period of developed Gothic; give the approximate date. Indicate about half the arch on either side and the string below the triforium. Draw to a larger scale a plan of the pier sections of the cap and base and of the arch mouldings. Indicate the joining of the masonry.

Make drawings of a rich or important example of Gothic woodwork and indicate the manner in which it is finished. Give detail sketches of any mouldings and of any carvings used to enrich the example. An ornamental open timber roof, a rich half-timber gable, a chancel screen or stalls are suggested as suitable.

Make a sketch plan of an English Renaissance building erected during the seventeenth century in which one or more orders are employed. Give details of part of the building showing how the order is applied and any special ornaments that are made use of.

Make drawings of two openings (doorways or windows) from Renaissance buildings of a somewhat ornamental character. One is to be an example of trabeated, the other of arched construction. Add brief notes pointing out the chief advantages of each form of construction and the precautions that must be observed in employing each.

### Section III.

Draw the plan and an elevation and section of a building that you have personally visited and studied. Show as clearly as possible the nature of the construction and any decorative treatment. Attention should be given to neatness and precision in drawing—any features which require need not be drawn completely more than once. Give name and approximate date of the example selected.

Make a careful sketch with figured dimensions, or make drawings to scale of some feature from a Mediaeval or Renaissance building that you have yourself measured. The subject selected, which should be typical of the period to which it belongs, should include some carving or sculpture. Show all details of construction, sketch to a large scale profiles of all mouldings, and add brief notes of materials employed.

### Section IV.

Write a short account of some building you have visited and studied, which should not exceed two pages in length. Notes as to the date or dates of erection should be included. Describe the general disposition and treatment of the various parts of the building and any noteworthy features, especially characteristic of the style or styles employed.

materials used in construction should be described and manner in which they affected the construction. Illustrate by sketches, with the addition of brief explanations when necessary, the following terms:—Acroterium, baluster, bema, bondstone, cartouch (one only), cymatium, dog-tooth enrichment, dripstone, eustyle, frieze, gable, guilloche, minaret, newel, pendentive, podium, purlin.

#### Architectural Design.

Section and plan of a sash-frame and a casement window, the latter in two heights with transome. Write a short specification for painting walls, door and floor of a bath-room. What is meant by priming, planing, sprigged, flatted, clere coling? Give examples of hinges. What is cross garnet, rising and falling hinges?

#### Subject.

Design a clock tower as a memorial in a large town. It is supposed to be an open one, in the centre of a square or "place." The base should be utilised for drinking fountains, and there must be access to the clock internally (a ladder is sufficient). The height of the tower must be more than 75 feet, and the width of the base not more than 25 feet.

Materials, brick or stone, or both in combination.

Drawings required are:—(1) Sketch plan and elevations, showing scheme to be adopted; (2) three plans, a plan, plan of clock chamber, and a roof plan, to the scale of 8 feet to 1 inch; (3) one section, to the scale of 8 feet to 1 inch; (4) one elevation, to the scale of 8 feet to 1 inch.

Further drawing must be attempted either:—(1) Some section to the scale of  $\frac{1}{2}$ -inch to 1 foot; or (2) a perspective.

### TORPHICHEN PRECEPTORY AND CHURCH.

On Saturday afternoon Glasgow and Edinburgh districts of the Scottish Ecclesiological Society paid a visit to the preceptory of Torphichen, the principal Scottish residence of the Knights of St. John of Jerusalem.

John Edwards said that the Order of St. John of Jerusalem early in its history established itself in Scotland, and it found the country a recruiting ground for the warriors required for Eastern warfare. Men were a valuable asset to the Hospitallers—owing to death and thinning their ranks—and they found that Scotland possessed this asset. It was generally stated that the story was founded by David I., and this, although not certain, is very probable. The first charter which mentions the Order in Scotland is dated 1160. Early masters are known to us only by name, as the story is very fragmentary in its early period, but at the time of the Scottish War of Independence the master, Alexander de Wells, who was an Englishman, was found with his followers on the side of King Robert, and is said to have been slain at the battle of Bannockburn. A few months previous to this Sir William Wallace had taken possession of the preceptory, the knights were withdrawn to Linlithgow. Here he issued the only charter granted by him that has come down to us. In it he himself "Guardian of the realm of Scotland and of the Armies of the same." Mr. Edwards then made a rapid sketch of the subsequent preceptors down to the time of James II., when Sir Henry Livingstone, second of the first Livingstone of Kilsyth, is found in office. His family became one of great importance, holding even two earldoms—those of Linlithgow and Callander. William Knollis, who succeeded Livingstone, was one of the most distinguished holders of the office. He was the first to be called Lord St. John, a title which his three successors—Sir George Dundas, Sir Walter Lindsay and Sir James Sandilands—also bore. Henceforward the lay character predominated over the clerical, and the head of the Order in Scotland sat among the peers of the realm. Sir George Dundas succeeded to the title in 1504. He was the schoolmaster of Hector Boece, and was noted for his learning. He was also strenuous in vindicating the privileges of the Order against all parties attempting to infringe them, and did not hesitate to take legal proceedings against the king and bailies of Stirling for "brekand ye prevelege of John's." His nephew and successor—Sir Walter Lindsay—raised a monument to his memory at Torphichen in 1538, part of which still exists with the following inscription:—"Valterus Lyndesay hujus successor et ex-

sorore nepos hoc monumentum fieri fecit 1538." Sir James Sandilands succeeded Sir Walter Lindsay in 1547. Having espoused the doctrines of the Reformation, he resigned in 1563 the preceptory—with the different lands, baronies and other properties—into Queen Mary's hands, and received a Crown charter regranteeing them to him and his heirs united into one barony of Torphichen. A short reference to the large estates belonging to the Order in pre-Reformation times concluded the paper. Sir James Balfour Paul, in seconding a vote of thanks to Mr. Edwards, moved by Dr. Cooper, stated that it was in the minds of some to form some kind of society, philanthropic or otherwise, to perpetuate the Knights Hospitallers, and he hoped that such would soon be an accomplished fact.

According to Mr. T. Ross, the architect, Torphichen Church had been a building of much importance. Along with the old-fashioned village, it is situated well up the ridge of hills that separate the valleys in which Linlithgow and Bathgate are respectively situated, and from either of which it is some three or four miles distant, and quite out of the tourist beat; indeed, few people go there, but it is well worth visiting, both for its natural beauty and its great historical associations. The church and village are situated in a hollow among the hills, and it is with something of surprise that one sees for the first time the great massive tower and lofty church in this lonely, out-of-the-way spot. One's first idea is that it is an old baronial keep, with wide ample chimneys on the gables, with its weather-worn battlements and roofs still intact. But the sight of the surrounding churchyard, with its many quaint monuments, the traceried windows, and the parish church with its belfry, soon reveals the true character of the building, which shows the remains of a large cross church, of which the north and south transepts and crossing, with the lofty central tower, covered with a saddle-backed roof, still remain in a state of fair preservation. The parish church, an interesting structure of the seventeenth century, occupies the site of the ancient nave. Of the choir, part of the north wall remains, along with the east gable. The whole length of the fabric has been about 155 feet from east to west, the transepts being about 70 feet from north to south. These latter are groin-vaulted in three compartments. In the centre compartment are the finely moulded piers and arches for supporting the tower, rising to a height of about 30 feet (the tower itself being about 70 feet high), with the usual round aperture in the centre so invariably found in the vaults of all Scottish towers. There is a fine traceried window in each transept, one in the south gable and the other in a side wall. From the north transept there has evidently extended outwards a long row of domestic buildings, of which the remains of one exist about 100 feet away, and from the apartment next the transept a window of an upper floor still remains looking into the church. This window is provided with side seats, so that the occupants of the chamber could participate in the church service without going into the church.

The peculiar feature of Torphichen is the upper chambers, four in number, one over each transept, and two, one above the other, in the tower. These are reached by a wheel stair, now in a very broken condition. These rooms are of a fair size, about 20 feet square, and with their thick walls and quaint small arched windows one can easily realise how comfortable they were with their blazing fires in the long nights of centuries ago.

These buildings probably date from about the beginning of the fifteenth century; but a small fragment, now built into the wall beneath the great west arch of the tower, is of the Transitional period of the twelfth century. It consists of a round arch supported on shafts having carved capitals, and may have been the chancel arch of the first church of Torphichen. The data for the early history of the place is not very great, but this arch is as good as a charter for its period. There are other details, built into the walls, belonging to the period between the foregoing dates, which quite bear out the statement of Mr. John Edwards, of Glasgow, when he infers from a grant by Edward I. of three oak trees to the Master of Thorfighyn that building operations were in progress then. Shortly after this, in 1296, the brethren of Torphichen sent a petition to Edward I., which shows how firm his grasp of Scotland was. They say:—"That whereas it is a great security to the English residents in Scotland to have access to a castle or fortress near them, in case of many accidents which might arise, although the land is now settled, he would be pleased to grant them of his Grace the privilege of access into the castle of Linlithgow, which is only two leagues from Torphichen, for the

safety of themselves and their goods when there shall be need, and as an aid and defence for the said castle if necessary, and that he would send a letter to this effect, if he please, to his Constable of Linlithgow." As Mr. Edwards remarks, the king was not quite sure about the hospitallers, but grants the petition, "provided that the Constable be sure of them." Two years later, in 1298, Wallace is in possession at Torphichen, and grants a charter, the only one by him which has come down to us, and the memory of this still survives among the inhabitants, as they can show you the sword of Wallace carved on an old tombstone now doing duty as the lintel of the curious window looking into the north transept already referred to.

### MODERN GERMAN FURNITURE.

A VERY marked change in the general character of interior decoration has occurred during the past few years in Germany. The present school of architects, painters, decorators and designers is aiming at artistic effects in which simplicity is the dominant note. The demand is for symmetry and grace of outline and broad, even surfaces with effective chromatic harmonies, but discards the mass of minor accessories and the elaborate detail which have hitherto characterised the treatment of a German interior and the art of the upholsterer. This change, according to the American consul at Chemnitz, was strongly pronounced last year in the exhibits of furniture and decorative designs at the industrial exhibitions held at Nürnberg, Yurikan and other places, and especially at the exhibition of German industrial art in Dresden. At the latter there were exhibits of over 100 completely furnished rooms. Nowhere were fringes, tassels, galloons or the like visible. Woodwork was almost invariably smooth, and but rarely touched by the carvers' tools.

The change in public taste is so marked that it has affected several well-established Saxon industries so seriously that the Government has felt compelled to carefully consider the situation, and ascertain whether any measures can be taken to relieve the stagnation in the group of trades directly involved. The Minister of the Interior recently called upon the Chemnitz Chamber of Industry for a full report upon the matter, together with its recommendations. Chemnitz, like other German cities, has, in addition to its Chamber of Commerce, also a Chamber of Industry—*Gewerbe-kammer*—directly representing in the productive industries both capital and labour. The Chamber has recently communicated its report to the Minister, and the following is a summary of its conclusions. In regard to such upholsterer's accessories as are produced by a branch of the so-called *passementerie* manufacture, there is no question on the part of the trade but that the tendency of modern art is completely opposed to the further utilisation of their creations. This is strongly marked in the costlier forms of furniture, less so in the cheaper forms. The chief cause is the demand for smooth, even surfaces, in harmony with the prevailing canons of taste. In the category of less expensive furniture the unwillingness to pay present prices for trimmings of good quality has limited the use to some extent. Upholsterers complain that heavy fringes, tassels and similar accessories, which formerly gave them much remunerative employment, now are completely banished, or are replaced by modest, inexpensive edgings. Until recently they were frequently called upon to undertake complicated designs of folded stuffs in the interior decorations of rooms, which involved preliminary sketches and a high grade of artistic ability in the execution of the plans. The present style of decoration calls for simple materials, free from folds, with a limited amount of embroidery, which are found ready made in shops, and involve no special ability in arranging. Plaster decorators and wood-carvers and turners state that their trades have all suffered seriously from the prevalent fashion for smooth surfaces on furniture and in decorative architectural features.

The Chamber has appointed a special Commission of experts to study the case, and the opinions of the members of this Commission are worthy of note. One member, an architect and professor in the technical college, declared that from the hygienic standpoint he was strongly opposed to any return to former styles, and in favour of extreme simplicity in all furnishings. Another member, the President of the Industrial Art Society, emphasised the fact that the modern decoration methods meant more light and a freer movement of air in the home than was formerly the case.

Further, the new movement had lifted German decorative art from a condition of stagnation, and it was now to meet competition in the world's markets. It was regretted that it involved temporary loss for a group of trades, but the future development would soon offset this for the workpeople now so seriously affected.

The Commission was, however, unanimously of opinion that the tendency towards simplicity was overdue, and was in danger of becoming a fad rather than a healthy, artistic development. Symptoms of this appear to be already visible. The older patterns favoured in the orders given for the choicest kinds of stuffs employed in upholstery. There is a fall in the demand for perfectly smooth and even surfaces of furniture. Projects for intervention on the part of the Government, by offering prizes for designs in harmony with the older fashions, and by influencing the courses of instruction in the schools of industrial art, were rejected as unwise and useless. It was regarded as entirely outside the province of an administrative body to attempt to stem or guide movements which are exclusively questions of public taste and fashion, and which intrude into the domain of æsthetics. This recommendation will no doubt be followed by the Saxon Government. In the present state of unexampled prosperity in the industries of Saxony, especially in the textile branch, the classes of workmen affected by these changes will, it is said, easily find occupation. At present, however, they are inclined to treat the apostles of "the simple life" with scant courtesy.

### THE NATIONAL GALLERIES OF SCOTLAND.

THE Board of Trustees for the National Galleries of Scotland decided some months ago that it was advisable in the interests of the National Gallery and the National Portrait Gallery to make certain transfers of works of art from the one to the other. This resolution has now been given effect to, says the *Scotsman*, by the director of the galleries, Mr. James L. Caw. A few traits, of which the interest was primarily historical, have been transferred from the National Gallery to the Portrait Gallery, and others in which the artistic interest predominated over the biographical have been brought from Queen Street to the Mound. Among the former class are specially mentioned the two portraits by Alexander Nasmyth of Robert Burns, the national poet—the known head and the cabinet full-length. These have been hung in the National Portrait Gallery, along with other three portraits of the poet—that by Peter Taylor of the earliest of the set, the Myres silhouette, done in 1787, and the beautiful Reid miniature, perhaps the most interesting of all the Burns portraits, which was executed by Dumfries shortly before his death. The whole forms a strong and quite unique group. Another portrait taken from Queen Street is that of David Hume, the philosopher, by Allan Ramsay, which constitutes an important addition to the Gallery of national men of mark.

From the Portrait Gallery there has been taken the portrait of James Oglethorpe, the founder of Georgia, by the Mound, by the permission of the trustees of the Duke of Hamilton, the noble full-length portrait of the second Duke of Hamilton by the Dutch artist, Daniel Mytens. By the Hague about the end of the sixteenth century an artist was for some time Court painter to King Charles II. until he was superseded by his more brilliant neighbor, Anthony van Dyke. The Duke of Hamilton here portrayed himself in the title—received a mortal wound in the service of Charles II. at the Battle of Worcester. He is also seated at the Portrait Gallery in a group with Laud, painted by Cornelius Janson. The young Duke, with an aristocratic mien, is elegantly posed. He is attired in silvery grey velvet corded costume of a Cavalier, a pointed doublet, slashed on the breast and sleeves, a lace collar, wide knee breeches and grey jack boots. His head is a full wig. In his left hand is a black Cavalier hat; the right, carried to the hip, holds a staff. For ground there is a Classic terrace with marble balustrade and pillar in a rich brown tint, a turquoise shaded curtain on the left, and a conventionalised landscape. The painting is careful and distinguished, especially of the picturesque costume, and the silvery coloring gives much charm to the portrait. This work has been hung in the first gallery not far from a splendid group formed by centring the Rembrandt and supporting it by two portraits by Franz Hals. Another portrait, of artistic and historical interest, is that of Margaret T.

Henry VIII. and queen of James IV. of Scotland. by the Flemish artist, Jan Mabuse, who flourished and of the fifteenth and beginning of the sixteenth s. This portrait is in his early Flemish style, he went to Italy and became Italianised. Painted el, the portrait, bust size, is that of a sweet young a rich brown hair, dark brown eyes, a dainty mouth ty chin. On her head is a quaint jewelled chaplet and silver and red tints. The dark velvet robe is ut and open at the bosom, and shows at the sleeves satin lining. Round the neck is a velvet band a jewel in pearls and rubies; and over the s is a massive gold chain with large open links. o little hand with rings on two of the fingers is to the bosom; the other is toying with an open resting on a rose-tinted piece of drapery upon a ry table. The face is notable for the warm, bloom- ur in fine preservation, and the portrait generally nished workmanship put upon it.

ie's portrait of himself as a young man—an admir- ce of work—is now at the Mound, hung in the last on the right of a new landscape by Crome, referred rmer notice. The subject of this latter work is a y in Wales, and out of simple materials the artist ted an impressive picture. An interesting portrait anferred from the Queen Street Gallery is that of er Runciman the artist, who was master of the school of the Board of Trustees in 1773, and his John Brown, a portraitist of the same period, in discussion over a passage of Shakespeare's est," which is open before them. Runciman, in a crimson cowl with tassel and striped gown, is a gure. The work, dated 1784, belongs to the Society quaries. There have also been transferred to the a portrait of Sir Hugh Paterson of Bannockburn, a Thomas Seton, a little-known Scottish painter he last quarter of the eighteenth century; and a roup in rich colour, showing some deterioration, by y Geddes, of Terry, the actor, and his wife, Elizabeth h, a daughter of Alexander Nasmyth, who painted ns portrait. It was this Mr. Terry who dramatised er of the Waverley novels—Scott called it "terrified" e Edinburgh stage in the beginning of the nineteenth

charming portrait of Mrs. Bruce of Arnot, by Allan y, the acquisition of which by the Board of Trustees ntioned about a fortnight ago, now hung on a screen, n much admired for its grace and delicacy. The work by W. E. Lockhart, "Gil Blas and the Arch- of Granada," has been placed in the fourth octagon. its story well and, alike in its correct draughtsman- d rich, glowing colour, it is in all respects an excellent e of the art of the painter. In this octagon, on the e great portrait by Gainsborough of the Hon. Mrs. n has now been centred, and is well supported by n's portrait of Dr. Adam and by Watson-Gordon's t of the Provost of Peterhead, by a landscape by and the "School Scalin'" by Sir George Harvey; opposite a fine wall has been formed by giving a to Thomas Duncan's group of "Anne Page and r," and supporting it by Raeburn's portraits of Major y, with his horse, and Macdonell of Glengarry. e piece of antique sculpture with which the Gallery st been presented by Sir Thomas Gibson Carmichael, an of the Board of Trustees, is that of the head of n found at Thebes. The nose is damaged, but other- e work is in good preservation. The face has great r, and the tint of the marble, with age, is soft and ivory- e head, it is suggested, is the work of a Grecian or, who lived not earlier than 200 B.C. and not later o A.D. One reason for assigning it to this period is ere are signs of portraiture in the face. It is not a y generalised face such as prevailed in earlier n sculpture. This antique is an interesting addition small collection of sculpture in the Gallery.

eresting Discoveries have been made during the now in progress, of repairing the parish church of rooke. The removal of loose plaster from the east as revealed two windows in the upper part of the one in perfect preservation, and also traces of wall- ings and one or two black-letter inscriptions. The of the famous chancel, which was destroyed by Wal- am, is coming out almost intact, and the foundations e ancient chancel are known. Another appeal is being for the restoration fund.

## BRITISH SCHOOL AT ATHENS.

ON Tuesday the annual meeting of the subscribers was held at Burlington House. Professor Percy Gardner presided. According to the report for the year excavations had been carried on continuously at Sparta and had resulted in important discoveries. Progress had been made in the survey of Laconia and various outlying sites had been explored. Mr. R. M. Dawkins, the director, reached Athens at the beginning of November and paid a short visit to Crete with Mr. Woodward in January 1907. The remainder of the session was spent in Athens and at Sparta in super-intending the excavations. The director acknowledged his obligations to the Greek Government and to Dr. Kavvadias and Dr. Stais for assistance in obtaining photographs and carrying out various other commissions for correspondents. The assistant-director, Mr. F. W. Hasluck, who arrived in Athens on November 22, 1906, had been able to determine with probability the site of Caesarea Germanica, and identified two Frankish castles, Combouclea and Catoecia, near Brusa, returning to Athens on March 11. Mr. Guy Dickens was in Athens from October 1906 till March 1907 working at his paper on Damophon of Messene and writing reports of the excavations at Sparta. Mr. J. P. Droop travelled in the South of Italy during November and December 1906 in search of Messapian inscriptions. Afterwards he and Mr. Wace spent a fortnight in Thessaly excavating the ancient site of the Magnesian promontory. Mr. Jerome Farrell visited Aegina, Epidaurus, Tiryns and Mycenae, but his work was interrupted by illness, and he was obliged to leave for Switzerland. Mr. Walter George arrived in Athens on October 11, 1906, visiting museums in Germany on the way. After working in the Acropolis Museum and travelling in the Argolid, Mr. George went to Egypt and worked at Cairo, Medinet-Habu and Abydos. After leaving Egypt he visited Salonika in April, and a complete and full survey of the following churches was made:—St Demetrius, St. Georgios, Eski Juma and the Holy Apostles. Miss Mary Hamilton, who held a fellowship from the Carnegie Trust for the Universities of Scotland, came to Athens in November 1906. Her special subject of study was the festivals of the Greek Church and their connection with the ceremonies of the ancient Greeks. Mr. T. E. Peet arrived in Greece in January 1907, and spent three months in the study of prehistoric Aegean antiquities. Mr. H. J. W. Tilliard arrived in Athens in February. In the National Library he studied a thirteenth-century manuscript of Greek Church music. Mr. A. J. B. Wace travelled in Greece during November 1906, visiting Monemvasia, Epidaurus, Limera, Asopus, Helos, the Hyperteletic Sanctuary, Krokeae Geronthrae and Sparta. Mr. A. M. Woodward arrived in Greece in October 1906, and worked at the literature dealing with the antiquities of Maina, and began to study the Spartan inscriptions of the imperial age from the point of view of prosopography.

In 1905, Mr. Wace observed some remains of a Greek building close to the chapel of the Theotokos, near the promontory usually identified as Cape Sepias in Thessaly, near Bromyri. It was conjectured that the foundations of a Greek temple would reveal themselves. The cliff was much corroded, and it was suggested that the temple to which the fragments belonged once stood on the cliff. The chief task planned for this summer was the complete exploration of the precinct of Artemis Orthia, containing two strata, belonging to periods before and after 700 B.C. It was also intended to continue the tracing of the city wall, to attempt to locate the Agora, and at the same time to go on sinking trial pits at various points. Another centre of labour was Sparta and the Sanctuary of Artemis Orthia. The Roman theatre (the "Circus" seen by Leake in 1830) had been completely excavated. The general plan, including entrances and steps leading to the seats, could be reconstructed from the remains, and Mr. George, whose architectural skill had been of the utmost value, was preparing drawings of the restoration. This theatre was built in the third century A.D. to accommodate the spectators who came in great numbers to view the contests in honour of Artemis Orthia. The arena of the theatre and the interior of the sixth-century temple had been cleared down to the solid earth, with the result that three strata could be distinguished. At the top was the Roman stratum in which stood the Roman altar. Below this lies a thin Hellenistic stratum containing remains and ashes, and in this stratum was a Hellenistic altar, immediately below the Roman one. The deepest stratum was a metre thick, and contained a large altar in very good preservation, made of roughly-

dressed stones. The altar stood near a fragment of cobble pavement, and was surrounded by charred remains. The rest of the lowest stratum consisted of a mass of objects ranging in date from the ninth to the sixth century B.C. These objects, the cobble pavement below them and the altar must be dated between the seventh and ninth century B.C. The temple of the same period had yet to be found. The temple which had been found should probably be assigned to the middle of the sixth century B.C., and to it might be assigned a fragment of a lion's head, brightly painted, and other scanty remains of archaic sculpture. The next object of interest discovered was the sanctuary of Athena Chalkioikos. The brazen house of Athena on the Acropolis of Sparta was a temple coated with bronze plates, in which Gitiades had fashioned the deeds of the gods and heroes. Athena Chalkioikos took her name from this temple. The temenos where the brazen house stood was surrounded by a colonnade and included other sanctuaries. Within the temenos Pausanias of Sparta took refuge as a suppliant, and was there starved to death. This famous sanctuary was identified when the first trial pit was sunk on the Acropolis of Sparta on April 4, 1907. The discovery of a roof tile with the descriptive stamp again left no doubt, and two more had since come to light. Many other interesting and instructive finds had been made.

The revenue account for the year showed a credit balance of 52*l.* 17*s.* 2*d.*, compared with a debit balance of 112*l.* 4*s.* 5*d.* for the preceding year, owing to the response to this year's appeal for contributions to the Laconian Excavation Fund. The deficit in respect of these excavations which was so prominent a feature in the preceding half-year's accounts had been nearly wiped out. The annual subscriptions amounted to 938*l.* 6*s.* as compared with 911*l.* 1*s.* for the preceding year.

The Chairman testified to the variety of the researches carried on by the school and the energy with which they had been pursued.

Mr. R. M. Dawkins exhibited several lantern slides illustrative of the excavations at Bromyri.

### GENERAL.

**The Plans** of Messrs. Mangnall & Littlewood, of Manchester, for the proposed pavilion to be erected at Weymouth have been accepted.

**Mr. Hewlett**, of Leeds, was on Monday selected by the finance committee of Barrow Corporation for the position of town clerk at a salary of 600*l.* per annum.

**Mr. Frankland B. Ware** has been appointed State Architect of New York in succession to the late George Heins.

**The Institution of Civil Engineers** will hold their first ordinary meeting on Tuesday. There will be an address by Sir William Matthews, K.C.M.G., the president, and presentation of medals and prizes awarded by the Council, followed by a reception by the president in the library after the meeting.

**Dr. Meredith Young** has been appointed by the Marylebone Borough Council medical officer of health for the borough at a salary of 600*l.* per annum. Dr. Young has been medical officer of Stockport for about ten years.

**The West Ham Town Council** have passed a resolution in favour of the borough being chosen as the cathedral city for the proposed new diocese of Essex. The Mayor said that West Ham had a population of 300,000, and the surrounding districts a further 800,000, and no town was, in his opinion, more fitted to become the centre of religious life in the county.

**The Stirling Town Council** have agreed that the time for receiving competitive plans of the proposed municipal buildings be extended from October 31 to November 30.

**The Town Council** of Lancaster last week considered the question of adopting an official badge for the town. The red rose was proposed, but it was pointed out that this was a "Royal emblem," and would cost a great deal to be registered. It was also urged that it would not be right to appropriate for the town a badge that belonged to the county of Lancaster. Eventually, however, it was decided to adopt the red rose, as it was part of the crest registered by the Heralds' College. It was agreed that the adoption of a part of a crest was quite in order. Notice was given to move a resolution to rescind the resolution by which "Luck to Loyne" was accepted as the town's motto.

**Excavations** are about to be carried out at the amphitheatre at Maumbury Rings, Dorchester, believed to be the most perfect of its kind in England.

**The United Free Church**, Scotland, are making arrangements for the erection of about sixty new churches about the same number of manses in the High Presbyteries. An appeal for 150,000*l.* was made some time ago.

**The Metropolitan Asylums Board** in May relieved J. W. Restler, the deputy chief engineer, of his duties as district engineer for the Southern District, in order that he might devote himself entirely to assisting in the control of the whole of the engineering department. The committee at the last meeting recommended that Mr. Worger, who is at present an assistant engineer of the Southern District at about 650*l.* per annum, should be appointed to the vacant office at an inclusive salary of 1,000*l.* A question, however, was raised as to the position of Mr. Worger in regard to compensation under the Board's regulations, and after some discussion the recommendation was carried back with the view of having the position made clear.

**The Dean and Chapter of Winchester** have issued a second appeal for a further sum of 59,000*l.* to enable them to complete the work that is absolutely necessary for the preservation of the cathedral. A careful estimate of the required expenditure amounts to no less than 80,000*l.* Towards this sum there has been received in payment of promises about 27,000*l.* The appeal states:—"We have no permanent fabric fund, and our revenues have been greatly reduced for some years past. Consequently we have no option but to appeal to the further generosity of the nation for help in securing the safety of a building, unsurpassed in beauty, which is also a national monument closely identified with the makers of our history and hallowed by memories of the great heroes of our country."

**In a Special Report** to the Hanley Town Council on the smoke nuisance, a sanitary inspector stated, with reference to steam boiler chimneys, that it was an acknowledged fact that the dense volumes of smoke which were emitted from these chimneys were unnecessary. He had visited a number of works, and in the majority of cases had found that nothing whatever was being done in order to try to abate the nuisance. In order to ascertain the best method of securing the abatement of the smoke nuisance he suggested that he should be allowed to visit several of the large towns where the matter had been dealt with. The Council decided that, under the direction of the medical officer, the inspector be authorised to visit other towns with a view of ascertaining the mode of smoke prevention there.

**At a Meeting** of Stirling Town Council last week it was reported that Mr. Fitzgerald, Assistant Secretary of the Office of Works, had visited the abbey along with the medical officer on September 25, and made an examination of the tower and ruins. Mr. Fitzgerald stated that he would favour a scheme for enclosing the tower and remains of the abbey church and chapter-house with an ornamental railing, and foundations of the walls of the ruins and bases of pillars being uncovered so far as possible, and the interiors of the buildings marked by being laid with gravel. The expense of the work and the annual cost of keeping the place in order would be borne by the Office of Works. He provided the patrons arranged with the farm tenant to give the grazing of the portion enclosed, while the public would be admitted to the enclosed portion as well as to the tower for the present payment of 2*d.* each. He further stated that at some future date the remaining portion of the tower might be similarly dealt with. It was agreed that after consulting the Board of Works and the Treasury officials Mr. Fitzgerald should submit a written proposal to the patron.

**At a Meeting** of the executive committee of the Scottish National Exhibition on Friday the spaces committee reported that allotments had been made to the value of 5,900*l.* that applications in hand were sufficient to take up the remainder of the space twice over. Considerable space was being reserved for any more applications that might come in, for which a system of selection by ballot or otherwise would be necessary. The committee had four proposals necessary to enlarge the machinery hall 50 per cent to accommodate the numerous and desirable exhibits. Satisfaction was expressed at the progress made under unfavourable weather circumstances at the industrial hall.

## THE WEEK.

WHEN commenting on the seizure of the paintings and drawings belonging to the United Arts Club for rent due by an under-lessee or yearly tenant of the premises, we said:—"It is doubtful whether a power which has been respected for so many centuries would be set aside by any judges." The decision in the Court of Appeal confirms the view taken by us. Their Lordships said they could discover no legal ground on which the exemption of the pictures could be supported. The action was dismissed with costs, and the stay of execution applied for in order to bring the case to the House of Lords was not granted. It was held down that by the common law a landlord is entitled to distrain upon any goods found on his premises without any regard to the ownership. That may be anomalous, as we said before, but the Court is bound by a long line of authorities. An effort was made to bring the case under the exception that paintings delivered to a person exercising a public trade, whether carried, wrought, worked up or managed in the course of his trade or employ," were exempt. But it could not be made out that finished pictures were things manufactured or worked up.

THE Hammersmith workhouse is likely to become a historic site, for it exemplifies the influence of some peculiar doctrines in political economy and sociology. The poor were supposed to be the victims of a false system, and compensation was to be provided for them by the State. At Hammersmith, the greater number of whom were engaged in a hard struggle to keep out of the workhouse, the whole of the bills have not been met, and we suppose if claims are brought into the Law Courts they will end in a similar way to the action taken for payment for the electric-light fittings. Messrs. FRYER & Co. claimed 606*l.* 18*s.* 4*d.* for standards, electroliers and sockets. The fittings were selected by the building committee from priced samples submitted. The Guardians imagined that a provisional estimate of 400*l.* could not be exceeded, and declined to pay more. Everything was done by the contractor in a proper manner, and the certificate of the electrical engineer was duly obtained. Practically there could be no defence. It was endeavoured to be made out that the contractor could be held responsible for the provisional estimate of 400*l.* But one of the Guardians, a builder, having declined to answer the question whether the contractor had completed the work was entitled to be paid, the court found for the plaintiffs for the amount claimed and judgment was given with costs. It remains to be seen whether the Local Government Board will allow additional money to be borrowed in order to meet such extraordinary extravagance.

An action was brought by Mr. J. C. SIM, architect, in the County Court, against the local School Board to recover 71*l.* 6*s.*, balance of his claim for fees in connection with the preparation of plans for alterations and additions to the school. After the plans had been prepared the Board decided to postpone the extension of the building, and they paid 70*l.* to the architect. Mr. SIM in his receipt acknowledged that the money was full payment for plans, schedules, &c., and for all work done up to present. . . . And it is understood that should the Board decide to proceed with the work of extension, the said 70*l.* will be an instalment of my fees." Subsequently the Board decided on carrying out the extension from plans by another architect. Mr. SIM accordingly claimed payment of the balance of his fees.

The Board denied that they were proceeding with the work as originally contemplated, and explained that the work that was being done was of the nature of alterations. They further pleaded that the claim was barred by the terms of the receipt. The Sheriff who heard the case considered that the receipt was a discharge of all claims for work already done. He also found that the additions and alterations represented on the plans were not identical, except in unimportant points, with the scheme of alterations recently carried out. As consolation, however, it was suggested that Mr. SIM might still bring an action against the School Board for breach of contract.

THE abatement of the smoke nuisance is most desirable. But care should be exercised when prosecutions are undertaken that they are based on rational and scientific grounds. Amateurs, artists and lovers of the beautiful in general regard themselves as superior to all mere business considerations, and so long as there is no sign of smoke in their district they do not care what industries may be hampered. There is no reason why manufacturers should like smoke; and if occasionally volumes of it are seen, the spectacle is due to causes which are not easily controlled. Mr. CURTIS BENNETT has decided one case which should be taken as a warning. The Chelsea Borough Council were induced to summon the Underground Electric Railways of London, Ltd., on account of the issue of smoke from the chimneys of the generating station. The magistrate declared the evidence given on behalf of the Borough Council was slender and unsatisfactory, and they admitted they were unable to find any fault with the works, which were as perfect as science could make them. The smoke was really dark brown, but looked black to the unscientific eye. The case for the prosecution having failed, Mr. CURTIS BENNETT said he considered that substantial costs should be inflicted. The amount would not recompense the company, to whom London owed a debt of gratitude for saving millions of passengers from the stifling atmosphere of the old trains. But he would order the payment of 300 guineas costs by the Council. It is to be regretted that the members of the Council cannot be made to provide that sum.

It is to be hoped the Australian Commonwealth will not decline to negotiate for a site for offices on the vacant land in the Strand created by the London County Council. It should have been long ago recognised that the land was too costly to be used for business premises, and unless acquired for colonial offices or allied institutions it will remain a wilderness for many years to come. It must be said, however, that the Australian Commonwealth had gauged the position of the Council. The land was valued at from 12*s.* to 20*s.* per square foot. But those are what are known as fancy prices. The Victorian Government obtained their site at 13*s.* per square foot. The adjoining site, which in some respects may be considered better, is the one sought by the Australian Government. It was valued at 20*s.* per foot, but the Australians offered in July 13*s.* per foot for a depth of 70 feet. The Council were willing to accept 18*s.* a foot. Every failure to secure a lessee must, as a matter of course, diminish the value of the sites, and the French fiasco was not without its effect. The Australians, therefore, reduced their offer to 12*s.* 6*d.*, and, instead of 70 feet, they proposed to take only 60 feet. That would make a difference of 3,000*l.* less per annum than the rent estimated by the Council. The improvements committee consider they cannot recommend the Council to accept such an offer. But unless there is a sacrifice it is very doubtful whether tenants can be found for sites having such peculiar characteristics.

## ANTONIO CANOVA.

FRIDAY last was the one hundred and fiftieth anniversary of the birth of ANTONIO CANOVA, the sculptor. It was anticipated that opportunity would be taken of the occasion to have public rejoicings in Italy. But it does not appear there were extraordinary celebrations. It is to be regretted if the countrymen of the sculptor have become indifferent to the reputation of so able an artist. Among foreigners the influence of CANOVA has declined, and it would be interesting to discover how far the Italians agree with them.

Opinion concerning his art has varied greatly in England. It might be said that contemporaneously with CANOVA a rival appeared among us. He was born in 1757, and two years before JOHN FLAXMAN was born in York. The English sculptor's style possessed the severity which was desired in CANOVA's works. Yet FLAXMAN was most generous in his appreciation of the Italian's genius, although he must have felt that the favour with which it was received by his countrymen was injurious to himself and his fellow sculptors. In the course of an address which FLAXMAN delivered before the Royal Academy after CANOVA's death he said:—

In considering the style of this artist's sculpture, we shall at once acknowledge a poetic fancy which gave a luminous interest to his conversation, equally with his compositions. His figures are graceful, his forms grand, muscle, tendon or bone most naturally distinguished, and the flesh seems yielding to the touch, by an execution as powerful as delicate. It has been observed by some that in Canova's sculpture we sometimes seek in vain for the severe chastity of Grecian art. This may indeed not be destitute of some foundation in truth, but we must not look for complete perfection in the works of imperfect man; he is most perfect in whom the fewest faults are discoverable. Canova in early life must have received a strong bias from the imposing and luxuriant paintings of the Venetian school, but many and great excellences counterbalance and, as it were, annihilate trivial and venial faults.

HAYDON, the painter, insinuated that FLAXMAN was morbidly jealous of artists who won public favour. But his treatment of CANOVA was a repudiation of the calumny. It should be remembered that several influential English amateurs had become CANOVA's patrons. Lord CAWDOR was one of the earliest; the Duke of BEDFORD was another; the Duke of DEVONSHIRE acquired several of his works; Lord CASTLEREAGH, the Duke of WELLINGTON, Sir WILLIAM HAMILTON, THOMAS HOPE, the historian of architecture, and others, including the Prince REGENT, preferred him to any English artist. He was even invited to prepare designs for a Nelson memorial. Towards the erection of his monument in the Frari, Venice, 4,000*l.* was subscribed in England. Yet FLAXMAN, although he must have regretted the tendency of taste, was not afraid to extol his Italian rival.

In our time it is doubtful whether any sculptor would venture to express so much praise. RUSKIN did not consider it was out of place in the early volumes of "Modern Painters" to condemn the "vile classicality," the "ball-room imagination" and the want of sentiment in CANOVA. Many amateurs have followed him. But it is satisfactory to find that one competent judge—the late Sir DIGBY WYATT—did not hesitate to speak of CANOVA as "the new bright light of modern sculpture"; and his works were said, if compared with those of his immediate predecessors, to stand out as light from darkness. Apart from the nature, purity and beauty of his figures, and the simple but most elegant execution of his work, DIGBY WYATT maintains that but for the energy and firmness with which he proclaimed his conviction of the value of the Elgin Marbles, our country might never have acquired them. But it is to be regretted, for his own sake, that CANOVA was unable to see the marbles until his career as a sculptor was ended.

The life of CANOVA is interesting, not only on

account of his success, but for offering a model instance of the system under which many of the great Renaissance artists were formed. He belonged to a family of stoneworkers. His birthplace, Possagno, was an obscure village about four miles from Asolo. The district abounds in marble; but more people visited the quarries than the village to which, prior to CANOVA's time, there was no other approach than the dried bed of a stream. When CANOVA was not more than three years old his father died and he was brought up by his grandfather. His education was in the workshop, and when he was a boy of nine he was recognised as an assistant who was able to earn wages. He was noticed by a Venetian gentleman, GIOVANNI FALIER, whom he was introduced to the Venetian sculptor BERNARDI, commonly called TORETTO, who accepted him as a pupil. We hear of incidents which recall the elder days of art. TORETTO was proud of the young man, and if he did not encourage him to undertake ambitious works it was because he realised that in so remote a district commissions of the kind were not likely to be forthcoming. But on the death of TORETTO, CANOVA was invited by his patron, FALIER, to Venice, and there he was engaged as an assistant by a relative, TORETTO'S. As he was employed for only part of the day the wages he received were merely nominal. He was without the modern desire for wealth, and poverty was not considered discreditable with a student.

It is easy to understand how a young mountain boy had seen no examples of painting and sculpture except those to be found in the simple churches of Possagno and the neighbourhood, could not fail to be impressed with the style of art dominant in Venice. He was able to study not only in the Academy, but in some of the private galleries. Apparently his first commission was for a pair of baskets of flowers and fruit, which he executed for the Commendatore FARSE. That they are not remarkable products for a lad of fifteen is, we think, creditable to CANOVA. Instinctively he felt that the representation of the human figure should be the aim of every true sculptor, and moreover flowers and fruit might have been imitated in the Possagno workshops by children. But such skill as he possessed was not obtained by the aid of any external machinery in the form of lectures, classes and prizes. The training was as simple as in any handicraft profession, and having the true spirit CANOVA succeeded.

CANOVA was occupied in his early Venetian apprenticeship with a subject which suggests that the old Classicism had still power among students of a humble class. Before his sixteenth year was completed he modelled at Asolo a figure of *Eurydice*. It was not in any of the lower regions, and a colossal hand was introduced as if to keep her within that bourne from whence the traveller returns. The model excited an enthusiasm such as was common in the golden age when masterpieces abounded. One of the results was an offer of a room in an Augustinian monastery to serve as a studio, and in which he worked for four years. He returned to Venice, where he undertook the companion statue of *Orpheus*, and he received a commission for a bust of the reigning Doge.

It was still the custom in Venice for an exhibition of recent works to be held in the Square of St. Mark, which was indeed a survival of a Greek custom. CANOVA was persuaded to send his *Orpheus* in 1777, when he was in his nineteenth year, and the approval it received was not only satisfactory, but convinced him that he had not mistaken the art for which he was competent. He obtained a commission for a statue of *Orpheus* in marble. Next he undertook a large statue of *Æsculapius*, and then an *Apollo and Daphne*, which was evidence of courage, for the work of BERNINI was just then admired. Next he was given a commission for a statue of *Dædalus and Icarus*, which was placed in the same room with *The Family of Darius*, by PAUL VERCESI, and which is now in the National Gallery. There were

ently an outcry against a sculptor in Paris who was supposed to have photographed a group of figures and reproduced them from the print instead of from the original. Some of CANOVA's rivals asserted that the two figures of the aeronauts were first cast in wax from the models and then recopied in marble. In no other way is it supposed so much accuracy could be attained. It can still be seen that the figures are not of an ideal cast, and that circumstance supported the allegation, which, however, there was no ground.

CANOVA was sufficiently advanced in his art to be convinced that he had still much to learn, and that the school for him was Rome. Accordingly he left Venice and arrived in Rome at the end of 1780. Seven years afterwards a similar experiment was made by FLAXMAN. Both the sculptors appear to have been encouraged by Sir WILLIAM HAMILTON. CANOVA, as an Italian, could however count upon official influence, and care had been taken to have his group of *Dædalus and Icarus* transported to Rome for the scrutiny of the Academy.

The Venetian ambassador gave him a commission for a group of *Theseus and the Minotaur*, and before the marble was completed the marble for it was placed at his disposal. The Venetian Senate had awarded him a pension of 300 ducats for three years, and this enabled him to give time to the study of ancient sculpture. His *Theseus* when completed was by some considered as inferior to a Greek work. But the statue was surpassed by his *Theseus and the Centaur*, which he executed a few years afterwards, and which was said to have surpassed the best Greek sculpture on its true basis. GAVIN HAMILTON, who possessed great influence in Rome at the time, declared that CANOVA was the only sculptor then living who was competent to undertake an important work. As a result CANOVA was selected to execute the monument of PIERRE L'ÉCLAIRÉ (GANGANELLI) and afterwards one of the predecessor REZZONICO. The latter is one of the most admired of CANOVA's works. It represents the Pope seated in a cope and kneeling, his mitre lying beside him. There is no suggestion of supreme power as in the other similar monuments, for what is seen is a bishop humbly kneeling. It has been imitated in memorials of other popes. That such a work could be produced by a sculptor who was known by his mythological subjects seemed at the time to be remarkable, and it is enough to suggest that if CANOVA had remained in Italy to Classic myths he could have anticipated a good deal of what is admired in modern works and might have become the pioneer of realism. The mausoleum of PIERRE L'ÉCLAIRÉ, which he had executed some years before, is less simple, but it had the effect of putting an end to the extravagance long tolerated in monumental sculpture.

A Papal monument was then supposed to place a sculptor in the highest rank, and CANOVA was able to include that he could remain in Rome and meet all the charges of his position. He was always a modest man, and the influence of his early life at Possagno was strong with him. He expected to be compelled to return to Venice, but after such a series of successes abandoned his humble Venetian studio. Much of his mechanical work on the two monuments was executed by himself, and as the labour was beyond his strength his health suffered during the rest of his life. It has been said that he preferred finish to all other qualities in a statue.

The outbreak of the French Revolution was as a catastrophe to CANOVA. He was only about forty, and it is supposed, like many of his contemporaries throughout Europe, to have hailed an uprising which was to promise a new era for every man of genius. He was one of the conservative Italians who found themselves both under the government of the Doge and the government of the Pope. He went back to his out-of-the-way Possagno, where he expected to live in peace. He could not expect commissions for his works of sculpture. But he hoped at least to find

enjoyment in painting pictures. His first work on a large scale was an altar-piece for the parish church of Possagno. He also travelled. But when NAPOLEON attained ruling power the sculptor could no longer hope to live in seclusion. There were moments when the Conqueror seemed to feel he had a mission to elevate Italy and the Italians. CANOVA was invited to Paris to model the bust of the First Consul, and projects were suggested by which he would become the chief agent in the glorification of his fellow-countryman. But CANOVA was obdurate to all the blandishments. Like a true Italian artist, he doubted whether the French had any real love of art, and the coolness with which the galleries of Italy were despoiled to enrich the Louvre he considered was due to a love of display rather than of art. CANOVA might have had the transformation of Paris in his hands and he would become in one way a dictator in Europe, but his heart was in Rome and he could not be happy outside the city. The only Frenchman with whom he was on friendly terms was QUATREMÈRE DE QUINCY, with whom he kept up a correspondence during several years.

If, however, he declined to be NAPOLEON's marshal in art, he was selected to represent nearly all the members of the new royal family—from Madame LETITIA, the mother, who is made to appear as if she were a Classic Priestess, to the Princess PAULINE, who preferred to be shown undraped. The large nude figure of NAPOLEON himself is in Apsley House, while a copy in bronze is in Milan. Many other Italians were taken as subjects by CANOVA, and he was invited to again visit France in order to prepare a bust of the Empress MARIE LOUISE. When Napoleonism vanished for a time CANOVA was deputed to recover the works of art which had been removed from Rome. It was a difficult duty, for, with the exception of Great Britain, the countries who had opposed NAPOLEON were eager to secure many of the masterpieces. By the aid of the Duke of WELLINGTON, CANOVA succeeded in having the claims of the Papacy respected. He seized the opportunity to visit London, primarily in order to see the Elgin Marbles, and here he was received with the respect due to his ability and honesty. On his return to Rome he was raised to a Marquisate with a pension of 625*l.* a year. He employed the whole of the money for charitable purposes. He died in 1822, and it was supposed that the inner complications which led to his death were mainly caused by working on marble in order to attain the finish which he desired. He designed a church for Possagno, and he left a large part of his wealth for the benefit of the inhabitants. Four years afterwards JOHN FLAXMAN passed away. It is not generally known that CANOVA sent works to the exhibition of the Royal Academy in 1817. He was described in the catalogue as "Principe Accademia de St. Luca." His works were *Terpsichore*, *Hebe* and a bust of *Peace*. In the exhibition of 1823 appeared his *Danzatrice*.

#### ARCHITECTURE IN AUSTRALIA.

THE last part of the Journal of Proceedings of the Royal Victorian Institute of Architects has a melancholy interest. At the beginning is the presidential address by Mr. FRANCIS J. SMART and a few pages further on is an obituary notice of him. Mr. SMART was born in Tasmania in 1852. Afterwards his parents removed to Victoria. At his own desire he was articled to Messrs. REED & BARNES, architects, who possessed an unusually large practice. After his pupillage he entered the Educational Department as an architectural assistant. In 1878 he commenced private practice in connection with the firm of Messrs. HENDERSON & SMART. Then he rejoined his old office, which during subsequent years was known as REED, HENDERSON & SMART; REED, SMART & TAPIN; and finally, SMART, TAPIN & PEEBLES. Mr. SMART was the architect for the National Museum and Public Library in Melbourne, the University and

the portico for the Town Hall. He designed a great many churches, convents, monasteries, mercantile buildings and stores. But his health broke down and he died on August 10 in his fifty-fifth year.

The address which he delivered a few months before did not indicate any feeling of weakness. On the contrary, it was marked by a hopeful and optimistic spirit. Mr. SMART considered that this year was a fairly prosperous one for architects; there was a large amount of work pretty well distributed, and they might safely conclude that depressed times and lean years had vanished. The members were feeling the prosperity and were able to display their individuality. The membership of the Institute was increasing, and there was greater evidence than before of spontaneous work and effort by the younger students. Mr. SMART compared other professions as strengthening the corpuscles flowing through the body of the community, while architecture was the "life blood itself, the very invigorating and colouring matter, and saves a community from being deadly anæmic. Architecture lies at the very portals of humanity. It is woven into its fabric and is part of its being, expresses its wants, its aspirations and its everyday life." Then he remarked how often nature aided in making a beautiful city. He contrasted Edinburgh, with its Castle Hill and Calton Hill as the termini of a thoroughfare, and Melbourne, "with its monotonous check-board squares and wide streets, more easily suited, as it turns out, to our modern tram and motor-car traffic—considerations which in themselves are practically accidental and happen to suit this practical age. To obtain a satisfactory result in such a case as ours, what is an architect called upon to do? Simply to content himself with the small or large site pointed out to him, and to work out his salvation as well as he can on a frontage, say, of 25 feet or 30 feet, or larger if he is lucky. He must design with care every moulding and form from the base stone to the top of the parapet, and enter into the requirements of his client in every particular by planning and arranging the details of rooms and fittings throughout, giving consideration to the style to adopt and its effect upon the surrounding buildings, and their effect upon it." The architect, according to Mr. SMART, should seek after something higher than his commission of 5 per cent. on the cost of his buildings. If he had no other motive he advised that the account should be made out in the following terms:—

To amount of account for professional services rendered in anxiously wondering if I could get your work, calling on you in a doubtful frame of mind to find if anyone else had obtained the job. Taking your level, making several bad sketches, in one of which you kindly pointed out that I had provided no doorway for one of the rooms and no proper position for one to be placed. Making a careful underestimate, or rather, an under-guess, of the cost, leaving out of consideration everything but the mere shell. Obtaining tenders and better work for you than was specified, and in checking grumbling contractors' heavy bill of extras and thoroughly displeasing you in many ways. Making-up contractors' account and the pleasure of sending in this one, which I hope you will settle by return post. Five per cent. on total cost.

He advised self-restraint, because the partiality for cement in Melbourne had led to excessive detail and bad architecture. It was easy to be showy, but too much flourish was wrong, and recalled the instruction to the village band, "When in difficulty beat the big drum." "Some architects," said Mr. SMART, "are fond of the big drum." He referred to the local Building Act, which had become obsolete, and was ill-adapted to the new methods of construction which had been introduced. The Institute had offered suggestions, but no definite result followed. Mr. SMART also drew attention to the exhibition which is to be held in Melbourne in 1908. The architectural section was to include not only drawings of new work, but views of earlier buildings in Melbourne and other towns. The hope

was also expressed that in course of time a Registration Act would be obtained.

In the speeches that followed further information was given concerning some of the topics introduced by the President. Mr. JOHN LITTLE, the honorary secretary, said that a report had been sent to the Council on the subject of the by-laws in 1905, and was still under consideration. There was little use in amending the by-laws, for they were antiquated, incongruous, and should be set aside and a new set made. Mr. BEVERLEY USSHER said that in connection with the Building Act the appointment of a surveyor for the city was most important. He would have to find a man of great ability, for, unless he were, with the methods there would be collapse of buildings and probable loss of life.

As regards registration, Mr. LITTLE said that he desired that the Bill for the purpose should be introduced into Parliament under normal conditions and discussed on its merits alone. They had no desire to pass hasty legislation. Other professions were acquiring legal status, but "the incompetent and worthless characters which had infested them were being driven out, and were at present making the architectural profession the theatre of their blundering work and their nefarious rascality." Mr. USSHER said they ought to be protected from the quacks and sham architects who were foisting themselves upon the public. Registration would do most of the architects who were practicing to-day very little good, but its effects would be seen twenty-five years hence.

Mr. HADDON argued that if dentists were entered to registration, and if a plumber could not work at trade unless he had proved his competency, surely it seemed anomalous that the men who built cities should not have their competency registered.

We may conclude from the reports that architecture in Melbourne is practised under conditions which are not unlike those in England. Business requirements are urgent in Melbourne, and it is believed they can be met only by the use of reinforced concrete. But the authorities imagine there are risks attending its use, and they hesitate to assume any responsibility for it. Yet with a competent adviser it would be as easy to prescribe conditions in Melbourne as in New York or Chicago.

As yet there is no sign that the Australian architects, although they have a free hand, have been able to improve upon the models long adopted in England. With a material like reinforced concrete they might be able to introduce other novelties besides piling storeys upon storeys. The only sign we can perceive of a reaction against stereotyped forms is in a criticism of a paper on a modern church building in the Journal of the Local Institute, where it is said:—"In our freer Australian religious atmosphere we decline to be bound by any of the traditions under which church buildings at home are erected. 'Orientation'—whatever it may mean—has no significance to us, and many of our Anglican and Catholic churches have their sanctuaries at other than the east end." It is also worth notice that a sketch proposed in the competition for a silver medal for a Roman Catholic church in the Byzantine style, which gave evidence that the Westminster experiment is appreciated in Melbourne. For the bronze medal the measured drawings an engineering subject is selected, viz. the abutment and half pier of Princes Bridge, Melbourne, at the south end facing east, showing the roadway span.

The practice of architecture in Australia, as in other countries, is not without difficulties. But it is evident that architects are doing their best to protect their own interests. Traders sometimes express disappointment at finding there is less desire to utilise new inventions than they anticipated. But it should be recognised that architects have not as much freedom as is desirable, and that antique modes and forms receive no less reverence in Australia and other Colonies than in Great Britain.

## THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last in the premises at Tufton Street, Westminster, Mr. Walter Cave, president, in the chair.

The following gentlemen were elected as members:—Messrs. T. H. Needham, O. G. Hunt, H. L. Geeson, F. S. St. J. H. Prynne, R. Woolley, D. J. S. Dawson, P. G. G. Small and J. T. M. Whitelaw.

## The Late Mr. G. F. Bodley, R.A.

The PRESIDENT said it would not be out of place if he made just a short reference to the death of Mr. Bodley. The deceased architect was not a member of the Association, but his work would be known to everybody in the country. He was the most distinguished exponent of Gothic architecture they had had in England for a great many years, and very probably the most eminent architect of the Gothic revival. Mr. Bodley's work bore an extraordinary distinction, and it was full of very deep thought and beautiful proportion. He was the means of introducing an entirely different note into the Gothic work in this country. Mr. Bodley was a gold medallist of the Institute. His charming personality, kindness and sweet disposition had won him many friends, and his memory was one which would long be remembered in England. On the motion of the President, a vote of condolence was passed to the widow and relatives of the deceased. Professor W. R. LETHABY delivered a lecture entitled

## Travelling Studies and Students' Drawings.

He said there was, perhaps, hardly a subject which could be made so delightfully interesting for them to hear about as the travelling studies of architects, and from many points of view. We might begin even a modern account of the search of architecture quite far back, and touch on various interests as they succeeded one another. There was the classical Greek phase, in which English research led the way, and the Gothic study in which we also led, and we were to be the first again in arriving at a stage of general enquiry in study. The adventures and discoveries of travelling architects—Adam at Spalato, Wood and Dawkins at Smyrna, Stuart and Revett at Athens, Cockerell at Nauplia and Barsoe—would make a most exciting and instructive story. So also would the enthusiasms and wanderings of the early workers on Mediæval architecture and John Carter recording so many things which had now been forgotten from England; Cotman, almost discovering the buildings of Normandy and making those wonderful drawings of them which remain still the most beautiful records of architecture which we have ever produced; the incessant activity of Pugin; and Ruskin, drawing all the details of Venice with one hand, while he was hanging the canals with the other. Or we might try to recall the impressions of our own impressions—the first look at some cathedral by starlight after a late arrival; the clearings, when the sky shone, never so blue, through the eaves of the parapets adorned with wallflowers; the views of Florence from the hills, Venice from the sea, the towers of Bologna against an evening sky, the drive to Apollinare in Classe, Rouen from St. Catherine's, and so on from the plain below.

For this purpose, however, was not to speak of these; nor was he going to argue for or against travelling studies, but to show that a good argument could doubtless be made out on either side. On the one hand, he thought it might be objected that such studies might even be harmful as leading to resultative ways, a sauntering view of architecture, and to discontent and disillusion. On the other hand, the knowledge of some of the world with a purpose, the possibility of making small discoveries of our own, the entering into the great part of art were all, assuredly, wonderfully valuable.

He passed by these ways of being certainly interesting, possibly even of being the most useful; for, after all, it was not one whether anything better could be done than trying to stir up enthusiasm; whether clapping one's hands and saying "Go it!" and "Tally Ho!" were not more to students than uttering opinions, arguing points and urging that we should get better value for our money. It was these last dull and troublesome things, however, that he was going to ask them to think about; but he was not arguing for the necessity of the study of ancient works of art through all future time, nor was he urging extension of the system. He did not even think that the studies stood high amongst the architectural principles of the moment, and his subject really limited itself to this,

Taking our facilities for study and our present methods of education for granted, how should they best be made not only productive, but reproductive?

In one's individual study the main things to be desired were definiteness of purpose and thoroughness of investigation. Without this definiteness of aim one might wander over half Europe without observing anything striking, without anything having been really seen. This definiteness might come in many ways—best of all for their purpose, he thought, from having attained the proper architect's way of looking at things, the seeing the object whole, and then resolving it into its component parts, not the ornaments, not seeing it in its atmosphere like a painter, but as active structure. It might come from marking down a certain era, or a geographical area, or it might come from having some other special interest for the time. But definiteness was essential. If they asked for a subject, he should almost say all subjects, for few have been attempted, and those that have been redone could be supplemented. Few subjects had been attempted in the modern light, for things were not done once and for ever; they perpetually needed doing over again, so that we could say nothing had yet been done finally. It was not a deep study of Gothic architecture to walk around Amiens and note the width of a buttress and the form of a diaper; then to go on to Beauvais and make a sketch of the towering spire as seen from the marketplace; and then to pass to Chartres, and so on. As to the different forms of Romanesque in Europe, or even in England, that was nearly an untouched field. For Italy, every town might be the subject of investigation, as Ruskin investigated Venice, Pisa and Lucca, Sienna, Bologna, and still Rome remained and would remain—many Romes, indeed; antique, early Christian, Mediæval. Better even than every town, every building of a certain standing and importance was a subject. If we might assume that the present type of civilisation was going to be long continued, every great building needed its special biography, for the time seemed near when many of them would only exist in books. Then as to thoroughness of investigation, only thus did the thing seem to enter through our thick skins to our hard hearts, and then only in small quantities—only at the end of a month did we discover some essential fact, and only thus could we begin to see the entire thing as made up of wall and roof and pier and arch as well as of cusp and pinnacle, colour, decoration and other overlays.

One of the great heresies of recent years was the sketching mania. He should like to say, never sketch. It swallowed up a lot of time, and resulted in nothing. Men he knew who had drawn carefully seemed to have more drawings than could be counted, for if they spent a week, or month even, over one study they soon increased, but the sketcher never got any forwarder. Drawings stood some chance of surviving, but sketches never. Nor did he believe that drawings ever got finished up at home; other matters pressed and they were put aside. Moreover, they would not work out; we could not decide whether a dimension should read 76 feet or 96 feet, and one got disquieted. Drawings finished at home got something unreal into them with every added touch. Everything done on the spot was something struck off between the object and the artist; that which was added at home was all artist. Let him beg of them to consider the importance of the studies they might make from the point of view of records. A great loss of seriousness had come about in many departments of art work by looking on it as only done for self-improvement and practice. In art schools a similar custom had sprung up of students looking on their drawings as a mere form of gymnastics: they were carried to a point, and were trampled on the floor, and the result of all this was that most life drawing was a very hollow business indeed. Now, the masters down to, say, Alfred Stevens looked on life studies as material for reference. Drawings should be collected and treasured, and when done with handed on to some museum to be preserved.

The central point of his story was really this. He did not think that students, or architects generally, or the public, had received sufficient return for the valuable yearly studentships which had been given for some generations, and the primary purpose of which was to encourage effective and productive study of old architectures. Properly, these scholarships were endowments for architectural research and culture, and must be double-sided in their aim, having a reference to the individual student and the wider public whose ambassador he is. The Institute disposed of between 400*l.* and 500*l.* a year in this way; the

Royal Academy of about 150*l.*, and other bodies of 200*l.* or 300*l.* in the aggregate. We might possibly estimate the total annual sum thus offered to students as about 300*l.* a year, which, capitalised—he believed this was the first time he had ever used that word—must represent something like 20,000*l.* He could not undertake to review what had been done as the result of this fine endowment, but at the highest estimate he could not think that the results could be considered other than disappointing. All these years French, German and Italian scholars had been minutely studying works of ancient architecture, and recording their observations in fine volumes and in many special publications of learned societies. Here, we must confess, it was hard to point to anything which had been systematically studied and recorded by the holder of a scholarship, anything which went beyond the formal task essay. Indeed, to go outside of the student question for the moment, and leaving living architects out of the count, we might venture to ask what contributions to the study of ancient architecture in Europe had been made by Englishmen during the last fifty years? So far as he knew, the last important original work on Classical architecture published by an English architect was the late Mr. Penrose's scholarly book on the "Principles of Athenian Architecture," while Mr. Street's study of "Gothic Architecture in Spain" was, he believed, the only one dealing with the Mediæval styles of the Continent which had anything of a reputation, so that one might see it referred to in the footnotes of foreign books. Professor Willis's learned treatise on vaulting, which did have an immense effect on the continental criticism of Gothic architecture (an influence which might be traced to-day, through Viollet-le-Duc, in Choisy's clear analytical diagrams), could hardly be mentioned, as he was not an architect. It was somewhat mortifying, indeed, that this work, which had more of what should be the architect's way of looking at things than any other that our country had ever produced, should have been written by one whom we must call an amateur, and so many architects' books were written by amateurs. But Willis, like Penrose, was disciplined in method. Our losses in this respect were manifest and manifold. While we did not take sufficient part in these things, we stood, in a sense, outside European scholarship, and necessarily acquired the characteristics of provincialism—characteristics which react, he thought, on all we do by way of architecture, and finally, on London itself, which had well been called "a colossal village," or a conglomeration of Batterseas. The loss in disciplined study to the architectural body and the individual was also momentous. Under the foreign system such study formed an opening to public art life and a contribution to science. With us it had been for the most part a sort of students' picnic—haphazard, desultory, faddy; such as it must necessarily be when no lines were traditionally laid down. A student gaining one of these valuable scholarships was apt to drift through France and Italy making notes of superficial forms, sketches of picturesque corners and water-colour drawings. The jottings, sometimes extraordinarily clever and individual, were brought back in various sized notebooks and half-finished sheets, and from that time were apt to disappear, so that it was almost as great a marvel what became of the immense mass as what became of the infinity of pins. Systematic travelling study should be clear in aim, accurate in record, and lead up necessarily to publication. Indeed, it was the lack of this last essential corollary to form a natural and necessary completion to their studies which showed the method to be wrong. Nothing else would brace them up to discard vagueness and unreality.

We did not, he thought, expect enough of our students. It was taken for granted that their views could only be secondhand reflections, and at the best of only academic value. But the body of students, he ventured to say, were not properly merely infant practitioners. They might, if rightly guided and wisely ambitious, fulfil a function necessary for the whole body—the real function of studentship. He more and more wondered at the gifts, aptitudes and enthusiasms of the young men, and felt assured that it was only suggestion and proper channels for their activity that were needed—these, and the aptitude of expectancy, not that of taking insufficiency for granted.

What we had to expect was that complete studies of great Greek, Roman and Mediæval buildings would be made by our students up to the standard of French and German work, and he could not think that if they were forthcoming there would be any waste of laborious study which had brought about the result he was venturing to bring to their

notice. When some of these scholarships were found means of publication were not so easy as they are now our methods of reproduction; but he could not think that was in the purview of enthusiasts like Soane and Pugin that collections made as a consequence of their benefactions should practically disappear.

Let them turn to the particulars of prizes and studentships in the Institute Kalendar—his copy, he found, was 1904. The first application of the endowments he had been speaking of was the announcement of an award of 25 guineas for an essay on the "Delineation of Architecture." The first thing that struck him on this was, not that there was anything necessarily wrong in the subject, or way that it was put, but that somehow it was obvious just an essay title "in the air." Those who set the subject and those who "wrote up to it"—if he might be allowed the phrase—were hardly likely to feel the pressing reality of the subject. Nobody wanted to know about delineation of architecture, and consequently there was a feeling of exhaustion and make-believe about the whole matter. He feared that former years might have been like it for he found that in the seven years previous the prize was withheld four times, the contributions not coming up to the pitch, whatever that might be. Who, indeed, was likely to play up to the situation when such questions were pounded as it were in a vacuum, and when the answers remained by custom in oblivion after judgment by incognito in camera? He could not help wondering, too, whether the essayists read the really classical utterance on architectural delineation by the late Mr. Emmett. The prize had now been given for twenty years, and it was not business to be getting a character for intrusiveness and inviolability, but he did want these things to be brought up to standard. The intention in the establishment of this essay prize could not have been to encourage mere exercise writing. He dare say all this because he did not know one of the essays, nor did he know where he could find them. It had not been the custom to treat the prize seriously, and he followed custom, and that was his complaint. To use the cant phrase, he complained of the system, not of the individual, and he could only wonder what a German university would do with such a prize endowment. The prize, it seemed to him, might be given on a set subject when it was desired to bring some branch of knowledge up to date; at other times it should be given for original researches, and all prize essays should be published as the standard introduction to the subject. Directly we want to know things it was easy to set questions by the score and hundred. If even it were a standing question like an account of the foreign architectural literature of the year, with a biography, how valuable would be.

He came next to the measured drawings prize of which had been given for twenty-five years and had brought forth nothing but good work. Still, he did not know what to lay his hands on the results, and he saw that in one direction it would be a valuable means for exploration and record. The valuable Soane studentship of 100*l.* followed. For fifteen years it had been of this amount, and for twenty years before that it was of 50*l.* That was, 3,000*l.* had been distributed in this way.

Then came the Pugin, the Godwin, the Owen Jones, the Tite, the Grissell, the Cates and the Ashpitel endowments and in all of them the vital and educative character of the exercises set had to be considered, and also the general ability of the answers and researches which followed. It ought to be possible to bring the general situation of architectural education to bear on the character of the essays and projects and records, and to make the endowments a very valuable accessory. He would like to see one of the events, the Institute prize for measured drawings, and so shape the conditions that the examples selected for prizes should be central and safe of their kind, and should be drawn in a plain, unaffected way, with readable lettering all more or less uniform. They should then be taken up by the Institute, and be printed and circulated as standard examples in the schools. Was there any student who would not be disciplined by thinking that his drawing might be "Standard example No. 22"? The Association had published a great number of years published in their sketch-book delightful views and valuable measured drawings of various ancient buildings which formed now a collection of immense value; but this sketch-book had no direct association with travelling students as such, and it did not propose to publish minute analyses of historical monuments. The practical aim of his paper was to suggest that a m

be found for the regular publication of worthy studies made by what he might call official students. His publication to bring about the actuality which was needed to make students' study in itself real and valuable. He could not believe there would be any difficulty as to publication if the books contained real matter. Indeed, up to a certain standard had to be bought by the great libraries all over Europe and America, and one of the consequences of what he had been speaking about was that they had to buy foreign books, whereas the students were not under the necessity of buying English books. Turning from this question of publication, he tried to bring to the mind of students the fact that the new conditions as to thorough study had arisen in the last few years by the establishment of British schools in Athens and Rome, to some extent parallel to French and German institutions in those cities, and that beside these exploring societies like the Egypt Exploration Society and the Egyptian Expedition Fund sometimes had work for young architects which was germane to their studies. To go out on a definite mission, self-imposed, or under the direction of others, stood in quite a different category to any of mere sight-seeing and note-taking, and this was the point that he wished very much to recommend to individual students. It was the old story of concentration which every virtuous lecturer dragged in, and which students received in the orthodox way as a pious commonplace. But really it was quite true that plenty of one thing was infinitely better as a stepping-stone to even universal knowledge than a smattering of many things. Again, they were not to be travellers to be students. They could learn of foreign art in their museums if they would really study the things. To do this they needed first to be drawn to special interest, and if they could not find what they were interested in it would not hurt to toss up. Then, after a general view of the things and where they were found, it was necessary to read all that was known of them, with some reserve of doubt that all that was said need not all be true. Then they should look at the things again and again and compare them with all others that were found, and at last they would be rewarded by finding that what somebody had called a cow was, in fact, a lion, and that one thing was a good deal like another, which was said to be English and not French. In conclusion, he hoped they would understand that he was not spoken entirely of ideals and principles, and that least of all he had any thought of less than reverence for the arts and their works. Studentship should be a spirit of youth, but for all our lives. We saw in those days and it and in whom it lasted—Cockerell, Penrose, and Street—types of mind which sweetened and ennobled the calling to which they belonged. Granted that to the extent it might be a matter of natural bent, it was, nevertheless, a matter of heart plus imitation. Without discipline and leading, perhaps two in a hundred could be brought through to be amateur students, but with proper guidance and discipline he could hardly think that so many of a hundred could remain untouched by its refining influence.

WALTER MILLARD proposed a vote of thanks to Mr. Lethaby for his lecture, and said he had often wondered how important it was for students to be set a method of study, and the lecture had emphasised this point. It seemed to him that the first endeavour of a student should be to master one single building no matter how large, and he should be taught to grasp the building as a whole and to know all that could be learnt about it. To draw it and represent it exactly to scale. Once the student understood all that was to be known of even a single building his knowledge would serve as a key to the secrets of architecture.

THEODORE FYFE seconded the motion, and agreed with the lecturer that a great deal of sketching was necessary, and he also suggested that the course of studies for architectural students should be more systematic.

H. H. STATHAM differed with some of the views expressed in the lecture, for he could not agree with the lecturer that the results of architectural studentships could be so much time lost. With regard to sketching, he thought that all the best architects in modern times were sketchers, and he believed that the same genius that made a man a fine architect impelled him to make drawings. He ventured to say that by sketching a building seen on one's travels more would be learnt about it by merely looking at it. With regard to the Insti-

tute essays, Mr. Statham could not agree with the views expressed in the lecture. He had seen the last Institute essay, and thought the subject set was a most useful one. The objects of the essays were the education of the essayist, the encouragement of the habit of thinking critically on architectural matter and the expression of such criticism in literary form.

Mr. W. CURTIS GREEN also supported the vote of thanks.

## GERMAN TOWNS.

IN his last report Mr. Thomas H. Norton, the United States Consul, writing from Chemnitz, says that the sojourner in Germany is frequently impressed by the evidence of many-sided efforts on the part of municipal authorities to gratify the æsthetic sentiment of the population at large in all that appeals to both eye and ear. The tendency is almost as strongly evident as the more distinctly utilitarian determination to abolish mendicancy, improvidence and suffering from poverty during sickness and old age. An interesting phase of this policy is revealed in the prize competition offered recently by the authorities of a neighbouring Saxon town. The Town Council invites architects to submit suitable plans for the fronts of residential and business edifices. These façades should be in keeping with the location and general character of the place, and aim at fitting and harmonious effects, within the reach of modest purses. Four substantial prizes are offered for the most successful competitors, and other projects are to be purchased if deemed desirable. These plans will be placed freely at the service of property owners who decide to build or to alter existing constructions. It is hoped by this means to combat unfortunate and all too prevalent tendencies on the one hand toward monotonous uniformity, on the other toward the baroque and grotesque, when architectural details of projected edifices are often confided entirely to builders destitute of adequate training or taste for the æsthetic. The idea is certainly one which, if intelligently carried out, should eventually improve materially the general appearance of the towns where it is introduced. It is of importance in a country like Germany, where even in villages buildings are erected in continuous blocks. As but one side of a construction is exposed to public view, it frequently happens that the services of an architect are not sought. This habit of compact building, even in small places, dates from the olden time when dictated by the needs of mutual aid and protection.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT a meeting of the above Society held on Thursday, October 31, Mr. H. S. Chorley, president, in the chair, the report of the Council for the year 1906-7 was read. The total membership on April 30, 1907, was 169, namely, 32 honorary members, 70 members and 67 associates, as against a membership of 174 last year. During the year 1906-7 there have been nine general meetings and eleven Council meetings, compared with nine general and fourteen Council meetings in the previous year.

The silver medal and prize of five guineas given by the president, Mr. H. S. Chorley, M.A., F.R.I.B.A., for the best set of measured drawings of any ecclesiastical or domestic building erected anterior to 1800 A.D., was awarded to Mr. W. P. Rylatt for measured drawings of Methley Church, and Mr. Herbert Carnelly was given a bronze medal for his drawings of Howden Abbey Church.

The prize of three guineas for sketching was awarded to Mr. W. P. Rylatt. The prize for construction of three guineas was awarded to Mr. W. P. Rylatt. The prize for an essay of two guineas was awarded to Mr. W. Whitehead. The prize of three guineas for the best set of designs for subjects selected by the Council was awarded to Mr. H. Carnelly. A second prize amounting to 1*l.* 1*s.* was awarded to Mr. W. Whitehead. The prize offered by Messrs. Halden, value four guineas, for four sheets of testimonies of study for the R.I.B.A. intermediate examination, was awarded to Mr. W. Whitehead.

The school of architecture, under the auspices of the Society, in conjunction with the Leeds Institute and Leeds University, is proving of great advantage to the associates in preparing them in the subjects required for the R.I.B.A. examinations.

## NOTES AND COMMENTS.

M. EMILE TRÉLAT, who died last week in Paris in his eighty-sixth year, was a remarkable man. As the founder of the Ecole Spéciale d'Architecture he succeeded in doing what few would dream of attempting—that is, in creating a technical school which would rival Government institutions. It should be remembered that in France schools of science or art are closely connected, and to interfere with the organisation is perilous, but M. TRÉLAT was sufficiently courageous for the innovation, and his self-reliance and independence were rewarded. He was, however, trained in Government institutions, and distinguished himself in the Ecole Centrale des Arts et Manufactures. Then he took charge of a pottery, which in those days was a favourite occupation for laureates of that school. Afterwards he became one of VISCONTI's assistants in the works of enlargement at the Louvre. Next he was appointed professor of construction at the Conservatoire des Arts et Métiers. M. TRÉLAT also served as president of the Society of Civil Engineers. He had, in fact, gained a reputation in art and science before he founded his architectural school on the Boulevard Mont-Parnasse, and it soon was recognised as a necessity of the Quartier Latin. It is now in the Boulevard Raspail, having outgrown the original premises, and is directed by M. GASTON TRÉLAT, who took a prominent part in the last Conference of Architects. The number of distinguished Frenchmen, including M. EMILE LOUBET, who attended the funeral ceremony on Saturday, was evidence of the esteem in which M. EMILE TRÉLAT was held. On the same day his venerable wife expired in her eighty-third year. M. GASTON TRÉLAT has therefore a double claim on the sympathies of architects.

The lighting of schools in winter and on other dark days is so important, it is well to record the experience of the education committee of the London County Council. They have for some time past considered the relative merits of the systems of gas and electric lighting in the Council schools. Gas lighting by means of plain burners has been practically superseded in the schools by the introduction of incandescent mantles, which have been found preferable from the points of view of economy and efficiency. The committee endeavoured to obtain an accurate comparison of the merits of incandescent gas and electric lighting. As regards hygiene and general efficiency electricity possesses many advantages over gas, but from exhaustive comparative tables which they have had prepared it would appear that the cost of maintenance is about 50 per cent. higher. They are informed, however, that the present type of incandescent electric lamp is likely to be superseded in the near future by metallic film lamps, which will, it is anticipated, effect a very great saving in the consumption of current, and may even render electricity a cheaper illuminant than gas.

The organisation of the Franco-British Exhibition is so far advanced that applications from British manufacturers should be made before November 30. The different groups are presided over by chairmen who are representative of each. The Fine Arts will have Sir E. J. POYNTER, P.R.A.; Science, Sir NORMAN LOCKYER; Education, Sir WILLIAM MATHER; Engineering, Sir W. H. WHITE; Constructive Engineering, Sir A. BINNIE; Mechanical Engineering, Mr. T. HURRY RICHES; Gas Engineering, Mr. H. E. JONES; and Electrical Engineering, Dr. R. T. GLAZEBROOK. One of the most interesting sections for many will be the International Sports Exhibition. In order to have great public displays which will revive classic times a stadium in the form of an amphitheatre and having an area of 55,000 square feet will be constructed. It will accommodate 80,000 spectators and so international sports can be arranged on an unprecedented scale.

THE year 1911 will be the jubilee of the recognition of Rome as the capital of Italy. It was proposed to celebrate the occasion by a restoration of the Baths of Caracalla in "staff," and to use the structure for an archaeological exhibition. But the great expense of undertaking created opposition, and there seems probability of a worthy suggestion of the great meeting place of ancient Rome being raised to delight millions of visitors. A lesser project has been since brought forward. The Baths of Diocletian have not been entirely annihilated. The church of Santa Maria degli Angeli was one of the halls, and eight of the original granite columns remain. In two other buildings of the neighbourhood there have also survived parts of ancient baths. It has been suggested that no better memorial could be devised than to isolate as far as possible the Baths of Diocletian, and for that purpose purchase some mean houses which conceal some of the original walls. In the interior it would be possible to hold an archaeological exhibition. MICHEL ANGELO directed many of the alterations of the ancient building into the church, and a monastery for the Carthusians. But it is now considered more desirable to reveal much of the thermæ as is practicable. The building would not, however, be sufficiently attractive to serve as a temporary memorial.

## ILLUSTRATIONS.

MOOR CRAG, WINDERMERE.

THIS residence was erected for Mr. J. W. BUCKLEY by Mr. G. H. PATTINSON, contractor, Windermere, from the designs of Mr. C. F. A. VOYSEY, architect. The windows were in Buttermere green slate, fitted with wrought-iron casements by Messrs. WENHAM & WATERS. The roof was of green slate, also the pavements of passages, entrances, kitchen and kitchen garden. The joinery was all in oak by Mr. JOHN EDMONDSON. Windermere, the cost of painting, decorating, and upkeeping generally being reduced to a minimum. The garden was carried out by the Brothers MAWSON, Windermere.

UPCOTT HOUSE, OKEHAMPTON.

THIS house was built in 1904 for Mrs. MICHAEL WILLIAMS from the designs of Mr. GEORGE FELLOWES PRYNNE, F.R.I.B.A., of 6 Queen Anne's Gate, Westminster. It is placed on a fine site on the side of a hill facing the south, with a good view of the Dartmoor hills. Being in an exposed position the walls are very massive, and are built of local granite with granite dressings, and the upper storey is built with rough-cast. The accommodation consists of a good-sized hall, four sitting-rooms, eleven bedrooms, and usual offices, including outbuildings, &c. The house was very well carried out by Mr. H. HARRIS, builder, of Okehampton, at a cost of 3,990*l*.

TURNBERRY HOTEL, AYRSHIRE, N.B.

WINDOWS IN THE NAVE ROOF, ST. MARY THE VIRGIN, BEDDINGTON, SURREY.

THIS ancient and interesting church is undergoing repair. Considerable portions of the roof are to be stripped and retiled, and the stonework in the parts as the cills and mullions of the windows which has decayed is being carefully restored. Steps are being taken at the same time to improve both the ventilation and lighting of the nave by the construction on either side of the roof of dormer windows of English oak, effecting the desired result by the addition to the building of an interesting and quite characteristic feature. The work generally is being carried out by Messrs. DAWSON & SON, builders, of Beddington. The stonework and carving by Mr. N. HITCH, of Vauxhall, under the direction of Mr. H. P. BURKE DOWD, F.R.I.B.A., architect, of 12 Little College Street, Westminster Abbey.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first meeting of the Institute of Architects for the session 1907-8 was held on Monday evening last, Thomas E. Colclutt, president, in the chair.

THE PRESIDENT announced that the Cape Institute of Architects had been admitted by the Council to alliance with the Royal Institute of British Architects under law 77.

THE PRESIDENT said he wished to present the new Institute silver medal, designed by Mr. George Frampton, R.A. medal, he thought, was a very beautiful work of art, would be in itself an incentive to students in the future, a hearty vote of thanks was passed to the designer.

ALEXANDER GRAHAM (hon. secretary) said that since last general meeting in June the Institute had lost several members by death, among whom were:—Thomas Bull, of New Zealand, elected Fellow 1884; Nathaniel Stanger, senior architect in the Office of Woods Forests, elected Associate 1882; Augustus Eldred Jones, elected Associate 1878; William Leck, of Amesbury, elected Fellow 1904; Richard Lloyd Jones, of Denbigh, elected Associate 1856. Continuing, Graham said it was with sincere regret that he had to add to this list the name of George Frederick Bodley, who died away full of years. His enthusiasm for the art he made him hopeful to the very last that he might outlive the many monumental works that had been entrusted to him not only in this country, but in many other parts of the world. A vote of condolence and sympathy was passed to the relatives of Mr. Bodley. The Secretary announced that at the October statutory election fifteen candidates were examined, and that the following seven having passed had been granted by the Council certificates of competency to act as district surveyors under the London Building Act:—Mr. T. James Sidcup; Mr. P. Boothroyd Dannatt, of Greenwich; R. H. Jewers Mayhew, of Anerley; Mr. H. Blinman Kenzie; Mr. J. Douglas Scott, of Bedford Row; Mr. T. Tinsley, of Chelsea; and Mr. Stanley Towse, of St. John's Inn.

THE PRESIDENT then delivered the following

## Opening Address.

adies and Gentlemen,—In opening this the seventy-first session of the Institute, my first duty and pleasure is to thank my brother architects for the confidence they have shown in electing me for the second time to the position of President; and I desire to express my gratitude to the Council for the courtesy, forbearance and loyal support which they continually afforded me during my term of office in the last session.

In reviewing the work and the proceedings of the last session, it is with very great pleasure that I refer to the successful result of the visit to Edinburgh and the annual meeting there in July last. It is, however, much to be regretted that there was not so full a representative attendance from London and the provinces as one would have expected and as the occasion demanded. This may have been due to several reasons, such as the inclemency of the weather during last summer, the distance from London, and consequently the length of time that was required for the visit. It was satisfactory to note that a very fair proportion of the Council were present during the whole of the proceedings. There were present nine Fellows and many members of the allied societies. The programme of proposed visits to buildings prepared by the Edinburgh Architectural Association was a highly interesting one. The opening meeting was a reception given in honour by the Lord Provost and the magistrates, which was attended by a large and representative gathering of the citizens of Edinburgh, and was a very brilliant success and highly appreciated by the visitors. We were conducted to many buildings of exceptional interest, of which none, I think, appealed to us more than the Holyrood Palace and the latter building was the object of close study on the part of the visitors. Beyond the acknowledged merits of its architecture, especial interest and consideration were given to the very important subject of restoration, a question which has given rise to a keen controversy among the citizens and architects of Edinburgh. It will be remembered that a considerable sum of money was devised by the late Lord Melville to be used at the discretion of an architect nominated by him in a complete restoration of the Palace. Very many prominent architects and other authorities, however, have expressed considerable alarm at any

restoration of one of the most interesting remnants of Mediæval work.

The consensus of opinion among the visitors appeared to be very strongly in favour of non-restoration, the general verdict being that it was only desirable to devise some simple means of protecting the upper parts of the walls from the ravages of rain, frost and snow, and that very little need be done in the way of repairing. It was thought that restoration would practically mean rebuilding the greater part of the chapel and adding a new roof and vaulting. At present there is no roof, and the greater portion of the north arcade has practically disappeared. In fact, it was felt that restoration on such a large scale would practically mean that a new chapel would arise, and that much of the work of our forefathers would be obliterated, or at least renovated out of all knowledge. As it now stands this building forms a monument of Mediæval work, beautiful in design and workmanship; and properly protected it would continue, for ages to come, to afford an example of a phase in our art which can never be reproduced. By the courtesy of those in charge of the palace we were enabled to visit the suite of private apartments not generally open to the public, and these rooms we found to be of quite exceptional interest and beauty. This work is of the latter half of the seventeenth century; it acquires additional interest from the fact that something more than tradition exists as to the workmen employed in modelling and carrying out the various ceilings. These ceilings are of great beauty of design, and the modelling of the plasterwork ranks among the best ever produced in this style. The greater part is said to have been modelled *in situ*. We are shortly to have a Paper on the Royal Palaces of Scotland, by Mr. W. T. Oldrieve, the architect who has charge of these palaces on behalf of the Government. The subject is a most interesting one, and it may be confidently anticipated that Mr. Oldrieve, with his great knowledge of the subject, will treat it with the appreciation it deserves. I think we visitors were much impressed by the intelligent and keen interest in architecture displayed by those gentlemen present at our meetings who were not members of our profession. Their evident desire to encourage the production of what is best in our art must be as gratifying as it is fortunate for our Edinburgh brethren. In Edinburgh this interest and enthusiasm is not confined to the exhibitions of pictures and the permanent art galleries; it is generously accorded to our art both in public and private enterprises.

I think this feeling is not as evident in London as it is in the large provincial centres. Perhaps the reason is that a closer personal relation between the public and the architect exists in provincial centres than is possible in our overgrown London. For instance, I cannot but feel that the Corporation and the London County Council as corporate bodies show only the slightest knowledge of architecture. I think I may say that not a dozen architects of repute and position are known to either of these corporate bodies; whereas in the smaller cities, such as Edinburgh, architects and public bodies are better known to each other, and perhaps in consequence of this the citizens have more knowledge and greater appreciation of our art. In the northern capital the rise of the younger men is watched with interest and pride, and they are thus encouraged and stimulated in their careers. No less interest is taken in the work of those architects who in the past have created the buildings that adorn the city of Edinburgh and make it one of the most beautiful in the United Kingdom. Human beings, and especially artists, are so constituted that they demand sympathy, encouragement and appreciation. In the smaller communities this is given more freely and more generously than is possible, I fear, in our unwieldy London.

I now ask your permission to refer in a few words to the position of affairs in regard to the proposed revision of the charter and by-laws. In a note in the Journal of July 27, 1907, it is stated that "the recommendations of the Council for the revision of the charter and by-laws were duly brought forward and considered at the special general meeting convoked by the Council for the purpose, and held on Tuesday, July 2. These recommendations were the outcome of the Council's report on the resolutions respecting the question of registration passed at the meeting of April 3 last year. This report was presented to the general body, and was adopted at the meeting of March 4 last." At this meeting, in response to a question from a member, I ruled that Associates had no more right to vote on matters concerning the charter than they had to vote on matters

concerning the by-laws. The question as to whether Associates had this right came as a surprise to me, as it did, I believe, to most of the Fellows present at the meeting. I had to decide this matter on the spur of the moment. It appeared to me that if Associates had the right to vote on the revision of the charter they would be in a position to move and carry a resolution giving them by charter a right to vote on matters concerning the by-laws. This appeared to me to be contrary to the whole spirit of both charter and by-laws, and I ruled against the gentlemen who had brought forward the question. The business of the meeting then went forward without interruption, excepting that about half a dozen Associates left the room; but this, of course, did not affect the number of voters. There were still many Associates in the room and we had the benefit of their suggestions and criticism in considering the whole document before the meeting. The recommendations of the Council were carried with some slight alterations. Upon the question being put whether these recommendations should be forwarded to His Majesty and the Privy Council for approval a unanimous vote was given in the affirmative by a show of hands. A special general meeting to confirm what had taken place was then called for July 15. In the meantime a communication from an Associate enclosing counsel's opinion as to my ruling was received by the secretary: this opinion was an adverse one. The matter was then considered by the Council, assisted by their legal advisers, and they arrived at the decision that the whole of the proceedings of the meeting of July 2 were invalid. I announced this decision to the meeting of July 15, which therefore was immediately closed. Had the question of the rights of Associates not been raised the document relating to the revision of the charter and by-laws would have been at once submitted to the Privy Council prior to going to Parliament for a Bill. The delay is a matter of great regret to the Council, who had hoped to be in a position to assure the Institute that this important reform in their constitution was likely to be legally established before next Christmas. Their regret is the keener because the question of the election of Fellows, which was to have been on a different basis, may have to be left open for an indefinite period. This point, however, will be submitted to the consideration of a general meeting at an early date. None can regret the delay caused by my decision of July 2 more than I do myself, but I do not intend to make any apology for my action on that occasion. As I said before, I consider that the whole spirit of the charter and by-laws is against the presumption that Associates can have a vote in either case. I firmly believe that with very few exceptions this is the opinion of the whole body of members, both Fellows and Associates. It is sincerely to be hoped that the consideration of this important matter will be prosecuted with vigour and without unnecessary delay during the coming session. The question has to a large extent engrossed the attention of the Institute for nearly four years, and I believe that it has done so to the detriment of other important matters. I have no wish to minimise the gravity of the question, but I think there are other subjects which should receive our serious attention—subjects which in my opinion may better serve to further the object for which the Institute was established, namely, the advancement of civil architecture. It must be remembered that the number of capable and experienced men who can devote a considerable amount of time to committee work is naturally limited; at the same time one need not anticipate any difficulty in forming strong committees to consider the many important matters that should engage the attention of the Council in the coming session.

Among such questions are the architectural development of towns and suburban areas, the possibility of legislation respecting building by-laws, and the laws of light and air. The latter surely call for careful consideration by architects, not so much in their own interests as in that of the building owner. Until architects take definite measures to secure reform in this direction, I am afraid that little will be done, and that there will still be vexatious and unjust impediments placed in the way of those who are obliged to build. In this connection Mr. Simpson's suggestion that a Building Board should be established deserves the consideration of those who see the necessity for reform, both in Building Acts and in the laws of light and air.

The Institute would do well to take a more prominent and active part in the support of such societies as that for the Preservation of Ancient Monuments, the National Trust for Places of Historic Interest or Natural Beauty, the Society

for the Abatement of the Smoke Nuisance and other similarly useful institutions.

In speaking a few words on the subject of the architectural development of towns and suburban areas I must ask your forgiveness if I refer for a moment to my address of last year. It may be remembered that I then made suggestion that the south of London could become an integral part of the city of Westminster by means of the erection of "street bridges." I did not then know, or it has escaped my memory, that in an address previously delivered here a suggestion had been made, not entirely dissimilar to my own, but differing from it in that the idea conveyed was not that of complete street bridges, but of the addition of covered ways to existing bridges. In his address of November 2, 1903, Sir Aston Webb said:—"The widening of London Bridge is in full progress, and the temporary covered footways on either side suggest what pictures and welcome adjuncts they would be to our bridges. The most exposed portions of our roadways, cannot be crossed in wet and windy weather without great discomfort, which these covered ways would entirely obviate." I have drawn special attention to these words of Sir Aston Webb because I wish to apologise for my ignorance of them when I addressed you last year. It is a most surprising fact that no enterprising person discovered and drew my attention to my omission on that occasion, or since.

It gives me great pleasure to emphasise Sir Aston Webb's words by repeating them to-night. I still adhere to my former belief in the desirability of street and street bridges, but failing the possibility of these I think Sir Aston's suggestion should receive the closest consideration. Could not suggestions of this character be brought directly to the notice of our civic authorities? Surely it is advisable that the opinions of experts should be made known to these bodies.

A step towards that end was taken when at the close of last session a committee was appointed by the Council to deal with the architectural development of towns and suburbs. This committee was appointed in accordance with a recommendation of the art committee, and in consequence of a statement in Parliament by the President of the Local Government Board to the effect that the Government had before them Bills "to carry out what is immediately pressing" on this important matter. A full Bill is promised at an early date. The members of the committee were of opinion that this great question should receive the fullest consideration, and the Council concurred in their opinion. It would be difficult to suggest a question of greater interest to architects, affecting more intimately the art they practise, than one of the development of towns. The business of the committee will be to make themselves acquainted with the work in this direction that is being done by other countries, notably by Germany and by the United States.

During the last year we had several competitions which were of interest in many ways. I need not refer to that of the hall of the London County Council except to say that it gave rise to much discussion and criticism, and to no less than one animadversion; but on the whole the conditions of the competition received the approval of the Institute. The result, as you are aware, is not yet known. There are many other competitions, however, which I think call for some remarks from me. There always has been, and probably always will be, a strongly antagonistic feeling towards the principle of selecting an architect by means of open competition. Generally speaking, I do not consider the arguments against competition to be either very sound or very convincing. I think it may be admitted that our art has made considerable progress during the last thirty or forty years, and during the last few years especially this progress has been very remarkable. The advance may not always have been in the right direction, and certainly much of what has been done is open to adverse criticism. But results must be judged in a broad and generous spirit. The notion that open competition has been the rule is, I maintain, one of the causes why the art of architecture has advanced so wonderfully of late years. I therefore consider that in spite of certain obvious drawbacks, open competition is beneficial to our art. I believe that our younger men, by continuing the advancement of architecture in a manner quite admirable, and it is not too much to say that some of them, even the most distinguished, might have been left in obscurity had it not been that they were able to make known their genius by means of competition.

I have dwelt at length on the question of competition because I wish those who compete fully to understand

sympathies are entirely with the competitor. They therefore, I hope, listen with patience and forbearance. I make a few remarks, and those of an emphatic nature, in reference to two competitions which have recently taken place. I refer to those instituted by the Bethnal Green Local Board and the Acton Local Board, the latter being still in the open market. I use the word "market" advisedly, because in employing this term I wish to protest against the tendency to engage in competitions as a means of increasing business opportunities, at the expense of what is due to our art and to our members as members of an honourable profession. It should be our aim to oppose what is harmful in the spirit of mercantilism; we should not send our wares to any market that is open to us, regardless of whether the conditions are honourable to our profession or not. On the other hand, if we enter into competition in a healthy spirit of emulation, and maintaining the just tradition and dignity of our profession; if the unsuccessful make generous acknowledgment of the deserved success of those more able than themselves, then I think competition may be regarded as beneficial to our art and also to those competing. I tried to indicate what may be called the ethics of competition and the conditions under which competitions should be conducted.

I am with great regret that I feel called upon to refer in connection to the want of judgment shown by certain members in entering the competitions referred to above, to say, those instituted by the Bethnal Green and Acton Local Boards. I hope I shall have the sympathy of the members of the profession of all ages and degrees in recognizing the lack of perception of these competing architects. The conditions published by the Bethnal Green Local Board are not at all in accordance with the suggestions issued by the Institute for the conducting of competitions. No notice was given that the successful architect would be required to include any possible work in the way of arbitration, or to light or any other legal question that might arise, or of the fact that these matters are never included in the recognised fees sanctioned by the Institute and by local usages.

On being invited to nominate an assessor my attention was drawn to these conditions, and I endeavoured to prevail upon the Bethnal Green Board so to modify the objectionable parts in their conditions as to meet the views of the competitions committee and of the Institute. But any influence the Council or the President might bring to bear on their attitude was very much weakened by the fact that architects were known to be preparing designs, and could submit them, notwithstanding the veto against competition published in our Journal. Eventually, however, and after several interviews, the Board acceded to my suggestion. The competition was then placed on a proper basis, and I was enabled to nominate an assessor. When my decision to decline to appoint an assessor was made, I received remonstrances from several architects, always couched in courteous terms. These, however, failed to convince me that my first decision was an error, and I venture to think that my decision was justified by the sequel.

I have before said, I am a believer in the system of competition, but I feel very strongly that those members of the Institute who enter the lists should do so in a spirit of noble enterprise, and that they should be actuated by the desire to improve the *corps*, and should loyally support the competitions which are called into existence by themselves and for the purpose of protecting their interests.

I fully appreciate the struggle many of us have to make in a practice, and the consequent desire to enter into competition, but competitions should be entered into only when the conditions are fair and reasonable. Those members who in a thoughtless manner consent to compete while ignoring the usual conditions under which competitions are instituted, are doing an injury to their more cautious brethren and lowering the tone of the profession.

In regard to the competition for the Acton Municipal Hall, I must ask you to allow me to recall the circumstances so far as they affect the Institute. In the first place, the competition took place which was adjudicated upon by Mr. J. C. Anderson, and the successful architect, Mr. J. C. Anderson, prepared designs and obtained estimates. The estimate, however, was in excess of the sum the Board had at its disposal, and the design was abandoned. Mr. Hunt was paid his fees for this work, and again

instructed to prepare plans for a modified scheme. This he did, and a contract between him and the Local Board was then drawn up, and the official seal was to have been affixed at the last meeting by the then Council. Attention, however, was drawn to the fact that this meeting had been called on the day after the official year had terminated, and therefore the stamping would be illegal. It was then arranged that the document should be sealed by the new Board. But the new Board determined to abandon Mr. Hunt's second scheme and instituted a second competition. Mr. Hunt then applied for payment of his fees due on the work he had done. The Acton Local Board then took the extraordinary step of repudiating Mr. Hunt's just demands on the plea that their contract with him, approved and drawn up by the Board, was invalid by reason of the official seal not having been affixed. The matter was first brought before our competitions committee and the Board of Professional Defence, and ultimately before the Council of the Institute. The Council agreed with the recommendations of its committee that under the circumstances the competition should be vetoed, and a notice to that effect was put in the Journal. It was felt that if a public body could thus take advantage of a legal quibble there was nothing to prevent them recurring to the same tactics in the forthcoming competition, and that, in fact, it was inadvisable for any architect to have dealings with a public body who were acting in a manner which in a private individual would not be considered as honourable. It was also felt that as strong a protest as possible should be made against such extraordinary treatment of one of their brethren. The Council having vetoed the competition, I, of course, could not nominate an assessor when invited by the Acton Board to do so. I quite concurred with the action of the Institute.

I believe that some members of the Institute were not satisfied with my refusal to nominate an assessor, and that directly or indirectly they were instrumental in bringing to the notice of the Acton Board the name of an architect who was willing to undertake the duties of assessor. The result was that this gentleman was invited and has consented to act. I felt it my duty to place before him the facts of the case, but I regret to say that he was unable to take the view adopted by the Institute and by myself as President. With regard to the necessity of architects demanding a sealed contract when employed by corporate bodies, my experience, and on inquiry I find that of others, is that such a practice is seldom resorted to. However, I understand that the appointment of the gentleman now acting as assessor to the Acton Local Board is under sealed contract.

In July last an International Congress of School Hygiene was held in London, and I then had the honour of presiding over the section devoted to school building and equipment. On this occasion many papers were read, the greater number of them being in German. No doubt all these were of the greatest interest, but very small audiences were present, and I cannot help thinking that had the papers been read in English the attendance would have been larger, and the discussions which followed would have been more apparent and more satisfactory. Among the work in other sections a paper on the lighting and ventilating of classrooms, by Sir Aston Webb, calls for especial notice. This paper dealt not only with the title-subject, but also with school-planning generally, and should be invaluable to architects engaged in school building.

It will be remembered that the committee appointed to inquire into and to report on the condition of St. Paul's made an interim report dealing with the proposal to construct a sewer, the site of which would have been in close proximity to the south-west corner of the cathedral. This report had the desired effect of preventing possible disaster. The full report to the Dean and Chapter was of a reassuring character, and allayed the public feeling of keen anxiety in regard to the stability of the church. I think the expression of concern from all quarters serves to show what veneration and love is felt for Wren's masterpiece. It is with great pleasure that I announce a Paper on St. Paul's Cathedral shortly to be read before the Institute by Mr. Mervyn Macartney. We may confidently anticipate that this paper will be one of absorbing interest, dealing as it will not only with the architecture but also with the rich and varied history and associations of the cathedral.

The question of the destruction of the historic building known as Crosby Hall has occupied the attention of the public for many months. Its survival is justly considered of great importance from an antiquarian and historical, as

well as from an architectural point of view. Built in the year 1466, it remains almost the last example in the City of London of the continuity of English architecture before the advent of the Renaissance. Crosby Hall is one of the few buildings in the City that antedate the Great Fire. It is therefore a most important link between our own time and the Middle Ages. I believe the only other genuine Mediæval works remaining in the City are the Tower of London, the chapel of Ely House, and the Temple Church with its adjoining garden. For architectural and historical reasons the loss of either building would be irreparable. The work in Crosby Hall is most excellent and instructive, the associations are of supreme interest, and the preservation of this fine building concerns not only architects, but the nation at large. We cannot afford to denude our capital of every valuable relic surviving from former times. Much has been already destroyed that might well have been spared, and it is an inevitable consequence of progress that much will still be sacrificed. But though the London of to-day must of necessity lose many of the features that endeared it to Charles Lamb, to Dr. Johnson and to others of bygone years, surely we cannot struggle too hard against the devastating spirit that would spoil us of one of our most ancient civic buildings. We cannot expect or desire to oppose the progress of our day, but it behoves us to preserve and cherish those of our ancient treasures that can be saved. Not much of Shakespeare's London is left to us, but the places I have mentioned are all alluded to in his plays, and this should be a strong, I had almost said a sacred, reason for maintaining and cherishing such a work as Crosby Hall. When we read that the Duke of Gloucester commands the Lady Anne of Warwick to "presently repair to Crosby Place," or, again, that he bids Catesby to meet himself and Buckingham there, it is pleasant to feel that some portion of this house is still in existence; that its pavement has been trod by those who are immortalised by Shakespeare and is still left to us of a more prosaic age. Perhaps you may quite rightly charge me with being prosaic in dwelling at length on this subject, but in venturing to do so I am actuated by the feeling that so little is left in this City of the works of our forefathers, and so little of that work is known by the general public. We have still some portions left to us of the chapel to Ely House in London, but of the house all has gone. The garden lives in our memories by the work of Shakespeare.

I am venturing on an innovation during the coming session in respect to the duties which are generally considered to be the especial privilege of the President. You all know that it is his duty, and I may also add his pleasure, to give an address to students some time in February, and I had the honour of giving such an address last session. It occurred to me, however, that in a second address on the same subject I should more or less repeat the advice I gave in February last; and although repetition may sometimes have value, there is a possibility that it may descend to tediousness, and feeling this I ventured to approach a gentleman who not only feels the keenest interest in architectural education, but who also brings to the subject great experience and erudition. It is with the greatest pleasure that I now announce that Professor Lethaby has very readily and generously consented to deliver the address to students in February next. I am sure that not only the students but also the older members of the Institute will eagerly embrace an opportunity of listening to a paper by such a learned and cultured architect.

This innovation in the work of the coming session will not necessarily be followed by succeeding Presidents; they will of course act in accordance with their own judgment.

In bringing this short address to a conclusion, I must ask the pardon of my audience if they think I have touched on subjects of too controversial a nature. I feel, however, that one cannot be too earnest or too candid in dealing with matters affecting equally the welfare of the Institute and the advancement of architecture.

Mr. JOHN SLATER proposed a vote of thanks to the President for his address, and said that all the members of the Institute looked forward to his tenure of office with confidence, and they were all united in wishing him a very successful year. Allusion had been made in the address to the new charter of the Institute, which was still in the making, but Mr. Slater was glad to think that what appeared to be almost insurmountable difficulties two years before had been smoothed over. It was quite certain that in arranging a new charter they could not satisfy everyone, but he ventured to hope that by sinking individual proclivities they would arrange a practicable and workable

charter, which would foster education and further the interests of their art. Mention had also been made of the work of the Board of Architectural Education. Mr. Slater was very pleased to be able to state that the Board had with much encouragement in its endeavours to codify and bring into line the various methods of education in architecture all over the country. It was thought there might be some antagonism between the Board of Architectural Education and the Board of Examiners of the Institute, but he was glad to say that when those two bodies met the difficulties were found to be more imaginary than real. Mr. Slater held that the starting of the Institute examination was an impetus to architectural education which no other body could have done. There had been so much progress in education that the Institute were now asked to accept the examinations held by universities and other educational bodies as qualifying for the successful dates for exemption in the Institute intermediate examinations. In regard to competitions, Mr. Slater said he sometimes regretted that the word could be deleted from their vocabulary. In the last twenty-five years he had more or less taken an active part in the affairs of the Institute, and he remembered that there had been always almost acrimonious discussions on the results in competitions. It was perhaps certain the decision of an assessor or assessors in a competition would not be received favourably by all who entered it. It was not always unpleasant, the speaker added, to have a grievance, but he questioned whether it was always dignified to air it. Referring to the development of towns and suburban areas, Mr. Slater hoped the Government should take the matter up, and suggested that an Act might be passed empowering and compelling municipalities to provide open spaces in the areas controlled by them.

Mr. LEONARD STOKES seconded the vote of thanks, but did not quite agree with all the President had said concerning competitions. The speaker felt such work tended to encourage paper designs rather than building.

Professor BERESFORD PITE supported the motion, referring to the condition of affairs generally in the Institute. He said he longed for the day when they would forget politics and resume their art. Too seldom, he thought, did they mention made of the vital question, "What is the position of architecture of the day?" and yet that was the burning question of the profession, the question that underlies their purpose when they sat down to do their building.

Mr. H. V. LANCHESTER also spoke, and the vote was carried amid acclamation.

### EXCAVATION OF MEMPHIS.

ONE of the officers of the Royal Scottish Museum, Mr. Edwin Ward, will leave Edinburgh early in November for Cairo, where he will join Professor Petrie's party, and will be engaged during the winter and early spring in the work of archaeological excavation in Egypt. Last season Mr. Ward was for a time at Abydos, where several interesting discoveries were made, the principal work, which continued on to the end of March this year, was at Asyut, in Upper Egypt, about 200 miles south of Cairo, where Professor Petrie had secured a large area for excavation. During the coming season the work of excavation will be on a still more extensive scale. Memphis, whose site extends over the whole course of Egyptian history, and which at one time the finest school of Egyptian art, has never been excavated, and it is to Memphis that Professor Petrie and his assistants are to devote their attention during this and probably many succeeding seasons.

The director of the Royal Scottish Museum, in a letter to the *Scotsman*, says:—The task which Professor Petrie has set himself is perhaps the most important that has ever been undertaken by an explorer in Egypt. He proposes to do what has hitherto never even been attempted, viz. to bare the foundations of Memphis, the once renowned capital of ancient Egypt, a city whose history reaches to the beginnings of Egyptian civilisation, whose sculpture art was the finest Egypt ever possessed, and whose temple was planned on a scale of unrivalled magnificence, enlarged again and again, and adorned with innumerable sculptures by a long succession of kings. The reason for believing that this site will prove more than usually fruitful in the discovery of important remains, not only

ancient period of the history of the city; but of the when Memphis, as the emporium of Egyptian trade, brought into contact with the early civilisation of the Mediterranean, have been fully and convincingly stated by Professor Petrie in a circular issued by the committee of the British School of Archæology in Egypt.

Two practical ends are served by scientifically conducted excavations such as Professor Petrie is about to undertake at Memphis. The one which no doubt bulks largely in Professor Petrie's outlook is the extension of knowledge of a great people who in their monuments left continuous records of their political history and domestic life extending over a vast period of time. The other is the conservation of the objects recovered in the excavations, where they may remain for all time available to the public as a part of the actual evidence on which the history of the subject is based.

With regard to the cost of the excavations and the distribution of the antiquities which may be discovered, I shall quote Professor Petrie's own words from the circular to which I have already referred:—

"The clearing of this site, with gradual exchanges of land as required, will occupy many years; and it is estimated that an expenditure of about 3,000*l.* annually for fifteen years will be required to excavate the temple area apart from the city. As half of the discoveries will be made by the Egyptian Government, this clearance is expected to yield a considerable return to the museums of the country which undertakes to find the cost. It is hoped that this work will be effectively provided for by British resources, and that the School of Archæology will not need to depend upon foreign supplies, which would constitute a claim upon the results."

It would be a reflection upon our national spirit as well as an irreparable loss to our museums if the contingency mentioned in the last sentence should arise. It may, however, safely be assumed, I think, that the money required for the work will be found in Britain. May I be allowed to express the hope that a substantial share will be contributed from Scotland? Hitherto we in Scotland have given but meagre aid to the work of exploration in Egypt, and the claim upon the results has been a proportionately restricted one. In England, on the other hand, contributions are on a much more liberal scale, and the fruit each year in the addition of many valuable objects to the English collections. I would ask that similar public-spirited liberality should secure for Scotland a share of the results of Professor Petrie's work, as would help to place our collections on a level with those of England. I am not here referring to the great collections of the British Museum, which occupy the attention of themselves. But it is surely neither idle nor impetuous to attempt to place our Egyptian collections on an equal footing with those of Manchester, Oxford, or Cambridge, to which at present they are inferior both in extent and in the variety and beauty of the objects which they contain. As an illustration of the importance of the subject which is attached to this subject in the great provincial cities, I may mention that in Liverpool gentlemen have shared amongst them the expense of an exploring expedition which has worked in the neighbourhood of Beni Hassan for several years in succession, the result that Liverpool now possesses very fine collections of Egyptian antiquities, containing many objects of great interest.

It is unnecessary to enlarge upon the great and growing interest which the general public exhibit in the study of antiquities of Egypt, and the importance from the point of view of augmenting and improving our national collections. I desire rather to emphasise the importance of Egyptology to students of history, archæology and art. It is fully recognised now in England, in the United States, and on the Continent, and will no doubt in time be fully recognised here also. But in the meantime the study of Egyptology is essential to the study of Egyptology is absorbed by other museums, and the opportunity of studying the collections which we already possess reason-ably complete for the purposes of the student will soon no longer exist. It is true that we have acquired a large number of valuable specimens in the course of the last few years, but our collections are still wanting in many of the objects which are indispensable to the full illustration of the life and history of Egypt, and they are entirely without fine specimens of sculpture, which alone can give a true idea of the high level to which Egyptian monumental art attained. It is precisely specimens of the latter

class that Professor Petrie expects to find at Memphis, and it will be matter of profound regret if we are unable to secure for our museum a share of his discoveries.

In arranging to send out one of our officers to assist Professor Petrie we have done all that is possible with our ordinary resources. More, however, is required if we are to establish a claim to an important share in the distribution of the antiquities discovered, and I venture, therefore, to appeal to the public of Scotland to assist in the undertaking.

Any subscriptions or donations sent through me to Professor Petrie will be remitted to the treasurer of the British School of Archæology, and will be credited to the museum in the distribution of the antiquities.

It should be added that in this undertaking Professor Petrie receives no help from the Egypt Exploration Fund, which has done so much for the exploration of Egypt in past years, and with whose work he was for many years so intimately associated. The British School of Archæology, of which he is director, is an entirely independent organisation.

### SPANISH INTERIORS.\*

SPAIN is so vast in extent and varied in its people as to reveal many types of domestic dwelling. The north and south mark two broad divisions of the people and their architecture, whilst local resources are usually seen to be the governing factors in both design and fittings. Apart from palaces and the great houses of stately cities, Spanish homes are fashioned almost entirely of purely local material. The northern houses are usually destitute of both comfort and beauty, strength and economy being their dominating features. But those of the south are generally comfortable and frequently of great beauty. True Moorish houses always show the plainest of exteriors with all the interior wall, ceiling and floor space elaborately ornamented; but Roman and Gothic survivals reveal most beauty in design and exterior treatment and show nothing but the plainest interiors. Of course a great many "amalgams" are met with, and these if really old are usually the most interesting.

In the north the churches and town halls are the only buildings which attract attention, the streets of even large towns representing so many granary-like stores with rows of small square windows, destitute of glass and guarded without by ironwork and within by heavy wooden shutters. Perhaps the most interesting feature of the old northern houses is that which shows they were built as means of defence more than out of domestic considerations. The shapes and sizes are varied as the brains which conceived them, and there never was a land with a more "go-as-you-please" manner of building than is found in Northern Spain.

But some features are common to all. The house is invariably the stable, cow, pig, goat, dog and poultry shelter, hence one large portal through which a load of hay or the traveller's covered van may enter with ease. This door is usually in two leaves and is bound with a network of fancifully hand-wrought iron, and surmounted by immense nail and rivet heads. Sometimes there is a manhole in the main door, but always a little square or oblong hole just above the keyhole. This hole is called *el viso*, or the "look-out." It is guarded on the outside by cross bars of iron, and has a solid sliding block of wood or a thick iron plate to act as a screen within. During daylight the great doors stand wide open, but the moment evening falls the head of the house calls in a voice which alarms and thrills the stranger and native alike as it conveys the fears and dangers of nights long past. "Shut the door—shut the door," the man or woman will cry in singularly terrifying tones, and then again very impatiently, to the timid and slow moving child, "Go quickly; shut the door." But there is really very little to lock up if we except the human elements, and to-day they are in no immediate danger.

Inside the house is a barn, or more closely resembles the plan of a livery stable. You enter to find all the floor space given to one chamber with little "alcobas" running off at the back and sides as do the stalls in our livery stable. The carts, farm implements, conveniences of trade and the domestic properties—and these are singularly few—are disposed over the floor space. The animals usually arrange themselves as they please. One looks up to see the roof of tiles, and if it is high there may be two or even three or four tiers of "alcobas" or balcony-like galleries following the

\* A lecture given by C. Bogue Luffmann, director of Horticultural Gardens, at the Royal Victorian Institute of Architects.

walls. These are reached by hanging stairways, usually in stone and most ingeniously balanced and turned about. Here and there the stairways are of wood, but it will always be found that the house has been fashioned with due regard to the scarcity of this material. Wood is the dearest and therefore the rarest building material in Spain. Wooden floors are occasionally seen, and stout beams also as supports for upper chambers, but ordinarily floors from ground to roof are composed of stone, marble, tile, brick, pebbles and lime cement. The column is therefore the interior medium of support, and one may infer that its universal employment is due to the long-continued scarcity of building timber.

Spaniards of all classes are justly proud of their floors, and in houses of all types and occupied by all classes more attention is given to the ornamenting and care of the floor than all the rest of the house put together. This appears to have grown out of the Oriental idea of cleanliness—an idea which shows itself in many ways in Spain to-day.

Certain it is that one rarely meets with earth floors, not even in cave and hillside "dug outs," of which there are many in Spain. The most primitive and interesting floors are of pebbles of selected shapes, sizes and colours. They are usually set in a lime concrete and afford many quaint and storied designs. The most common pebble design is the Indian palm leaf, but there are also knights in armour, warriors and monsters, and all well figured out on the floors of quite small and unimportant houses. This class of work is to be seen at its best in the provinces of Old Castile, Aragon and Navarre.

Black, white and red marble provide the floors of the best houses, and the favourite pattern is a nagpie in squares a foot or so in breadth. Tesselated floors exist only as early Roman remains, but a kind of Brescia floor is seen in the north of Spain, and its existence is probably due to Roman colonisation; for the present Quirinal and other buildings in Rome have floors practically identical to the "pastas" of Spain. This "pasta" is made of a highly composite paste formed from mixing a number of burnt earths and sands and then adding a lime cement. When laid and dry this floor is rubbed down till it is smooth as glass. It presents a speckled appearance, dark red and white spots showing on a rich brown or greenish black ground.

Roofing, flooring and lining tiles of splendid quality are made from the clays of Navarre and Aragon. The best come from Ariza, a small town in Aragon, and these are much favoured by modern French architects and builders.

The "azulejos" or enamelled tiles are still common, though of course the most ancient and beautiful are much prized. The rare colour is a singularly rich celestial blue. Very good azulejos are still made in the south of Spain.

Inclined planes instead of stairways are not at all uncommon in tall houses and such as possess towers, so when the great Ferdinand rode to the top of the Giralda, as he is said to have done, he performed no remarkable feat, as it is equally easy for any horseman of to-day. These inclined planes were introduced by the Moors.

From end to end Spain shows remarkable examples of hand-wrought ironwork and one or two features which might with advantage be employed in Australia. The "reja" or iron window guard is often of great antiquity and rare beauty. Floral and animal figures as well as many ingenious designs are carried out in this ironwork, which, though strong to resist thieves and Lotharios, is none the less graceful and distinctly ornamental when used to bar entrance to door and window spaces. One great advantage of the "reja" and iron gate is that it admits of shutters and doors remaining open both day and night at periods when the house would be objectionable if closed. It must be borne in mind that there is practically no glass in Spain, hence the necessity for a guard when the shutters are not closed and barred. Where the "patio" or interior court exists the iron gate is indispensable as a means of revealing the opulence and comfort of those within. Crests and coats of arms in wrought-iron are frequently seen interwoven with the "rejas" and gates in front of doors.

It is not generally known that many of the finest old gates in Great Britain are of Spanish origin, and were presents or purloinings from Spain during the early Tudor period.

The Spanish cooking fireplace takes on many forms, but it is always primitive in design and usually capable of consuming one fuel only—charcoal. In the homes of the poor, and also in the inns and farmhouses, the fireplace is exactly the same as the blacksmith's forge—a round or

square pile of stone or brickwork with a hollow wherein the charcoal is placed. All round the platform are draught holes, which pass to the centre that no matter in what quarter the wind, there is enough draught to keep the fire alight. To quicken the embers a small fan of native palm leaf is used. Where the family is large several hollows may exist in the platform and a single fan or draught hole serves for each. Chimneys exist, and the fumes and smoke—of which there is certainly very little—find their way out of the house through the door and windows. Here and there is a kind of shoot in wood or iron to conduct the smoke through light holes, but this is only where husks, fern root or uncharred material is used as fuel. In houses of a higher grade the cooking range resembles a massive stone marble mantle-shelf, and is built against a wall. It has hollows for the charcoal and flesh pots and a draught hole in front of each. A marble or stone column is ranged alongside the fireplace, on which stands an active pestle and mortar, since all the sweet herbs of the "campo" are pulverised and employed in cooking, and many other things require to be milled and ground before placing them in the soup bowl or frying pan. In Spain it is the custom to pay a special surcharge for a fire and then get warm by stoking and abusing the heat. Heat and comfort are obtainable in no other way. As a matter of fact, no provision is made for warming the house or the person by means of anything worthy the name of fire. The "brasero" or charcoal pan is an ancient and often an elegant piece of domestic furniture, but it emits heat, or should it chance to do so it sickens with its effect by robbing the atmosphere of the necessary oxygen. Fuel for charcoal, nut shells and husks, pine cones, bark, corn cobs, peat, chips, "marc" of grapes and other odds and ends are consumed in the "brasero" and also in a birdcage-like contrivance, which is charming to look at but a trial to the flesh and the spirit when one wishes to be warmed. Lavender, broom, rosemary, leaves, cholla, husks of grain are consumed in these wicker fires, which in turn stand on a "brasero" or more elaborately legged stand either of wood or metal.

The Spanish poker requires deft handling, since but an old man or woman or a thoroughly experienced domestic can turn charcoal as it should be turned. No one is so likely to cause trouble as interfering with a Spanish fire or what passes for such. Charcoal moves and rekindles or extinguishes itself by remarkably fine distinctions in the way of handling, and those who interfere generally stand not these fine distinctions. To see a master of the "brasero" turn and reanimate all the blazing slumbering surface of a whole heap of charcoal is as fascinating as it appears mysterious. The poker is a spoon-like weapon, which placed at the side of the pile and given a deft twist performs a miracle. This is as it should be, for in the presence of such an entertainment one is liable to grow cold and abusive.

Furniture and fittings are extremely few in the homes of the common people. Tables and chairs are scarce to be seen. A small stool holds the single bowl or platter on which the meal is taken, and it is customary to stoop or squat when partaking of food. In some districts the seats follow the walls and stone or marble slabs take the place of tables. Stone and brick beds are seen of the same size and character as those of Pompeii. In the wall space a water pitcher hangs eternally, and usually not far from it is a long reed or tin tube used for conducting water to the fountain rock or spring whence the family is supplied. The principal chamber receives its distinctive character chiefly from the array of copper and brass ware employed in warming, lighting and cooking. These comprise braseros or charcoal pans of copper and brass, large copper, iron and brass; drinking vessels in the form of carafes, cantaros, jugs, mugs, cups and flasks; tea, coffee, chocolate pots and services, all in pure metal or of curiously shaped stands known as "partadores," and, as the name implies, used to keep the stool or table clean. The cooking vessel is brought directly from the fire. Spoons are commonly of horn or wood, knives are scarce and means so liable to be used as most strangers imagine.

The most picturesque cooking vessel is the "olla podrida" or pitcher, which is employed in boiling the "olla podrida," the appetising and most popular dish in Spain. Pitchers are invariably of copper and usually follow one pattern. This is easily explainable from the fact that the vessel is grown out of an ordinary water pitcher. The pitcher, and all other genuine Spanish domestic utensils, is of

made, and the art of brazing and patching is everywhere carried to perfection. In "lagars" or "haciendas," given to large rural establishments for the production of fruit, wine or other produce, one sees enormous pans in copper and which are employed in the making of boiling soups and carrying and serving food and water to the men employed in the "campo"

"panadero" or bread pan is the largest but usually finest of these vessels, as its use does not admit of ornamentation. On the other hand, the huge "cantaras" or "alderas," which carry the liquid and more solid fare, are often elaborately beaten and chased, so that the pans are thoroughly cleaned and set up on the walls of these Spanish interiors they reveal a strength and character barbaric, yet by no means devoid of charm.

A plate of all classes not infrequently take their meal on a common dish, bowl, or platter. With the poor this is general; hence vessels are found of a shape, size, and material almost peculiar to Spain. The earthenware clay dish is on the same model as an ordinary pan, excepting that it is deeper and has a much more perfectly flat rim. It is often met with in an aged state, especially in the north, where the earthenware vessels are still as primitive as those of the Iberians 500 years ago. Hand-wrought iron dishes and shallow pans with beautifully curved sides are also met with in the north, and these when kept bright and set off with massive hoop handles in copper or brass become articles of great charm. The reverse of this is sometimes seen—pans of beaten copper and the handles of iron. Spanish earthenware pottery bears a remarkably close resemblance to the Chinese in form, glazing and decoration. This is due to the long-continued commercial intercourse between Spain and the East, for it is undeniable that in China silks and other fabrics, woodwork, shapes and patterns on metal ware, the materials, colours and designs employed in glazing and enamelling, as well as a large amount of genuine Chinese work of the last few centuries, are met with throughout the coastal regions and in many inland towns and villages. The willow pattern and many other interesting variations have been employed in Spain for hundreds of years, and the most favoured garment of the Spanish maiden and matron—the flowered silk—of which they have come to regard as Spanish as themselves, is entirely of Chinese origin, the modern shape excepted.

Spanish plates are in form like huge saucers. They are moulded on a single and unbroken curve, and usually form a section of a circle as it would be possible for an artist to select. It is a feature of Spanish domestic ware that the lines and shapes are artistic, and this without attempt at adding any more ornament. The kneading of copper ware, the moulding of brass, the working of iron and the various treatment of earthenware all reveal a studied regard for the beauty of simple domestic utensils. Copper dining platters are lined with brass and have huge and rudely beaten iron rings attached to their sides that they may be hung on the walls.

There was a fashion in Spain some 200 years ago, but no longer respecting Spaniards of either sex sipping the beverage. The only traces of the tea-drinking habit in Spain are to be seen in the rare old brass and copper tea-pots which are set on the walls of houses. These are undoubtedly from the models; there is practically no difference between the Chinese and those of China of the same period. Anything but a tea service is extremely rare; in fact, it may be doubted if such exists anywhere, but little bowls and without handles, identical in shape and size with the English tea ware, and the same as the Chinaman uses to-day are frequently found, especially in the towns of the south. Chocolate and coffee were widespread and lasting luxuries, and pots for making chocolate are fairly common in all parts. The chocolate pot assumes a shape unique among European domestic vessels. It is purely utilitarian in design and may not be said to look handsome. It is rather singular or

It suggests its use, and being of copper with a rude handle and a kind of wild pride about its upright and shining face. The lamps are all made to consume oil, and are from a primitive Oriental design brought into Spain by the Moors. The "Mariposa," or "Mary's," is the lamp sacred to the young girl. It is literally a lamp of love, and the manner of its disposal in a window is a sign for the welcome lover. The woman's spoon is either of horn or wood, more

often of the former and fashioned by himself. Consequently spoons of singular shapes and sizes, and some most elaborately carved, are found in all parts. The foregoing list pretty well exhausts the prominent and everyday features of the Spanish interior. Of course the influence of machinery and the ubiquitous commercial traveller has been felt in Spain, and in the larger cities, more especially those on the coast, Brummagem, German and American utensils are rapidly replacing those of Spanish manufacture. Still it may be doubted if Spain will ever stand abreast of the other European nations. Guizot's remark that "Africa commences south of the Pyrenees" is in great measure true. Spain subdues and moulds to her ancient ways, and the charm and strength of the old will probably remain to her in everyday life when the rest of Europe has gathered the labours of her primitive handicraftsmen into museums.

#### Crosby Hall.

SIR,—The negotiations which aim at securing and transferring to the Chartered Bank of India, Australia and China a site which they will accept in exchange for the site on which the famous hall stands are not finally closed. But the position is very critical.

The committee had before them to-day a communication from the bank, stating definitely the matter must be brought to an early decision. That decision can only be that the committee's efforts to save the building have failed, unless donations or guarantees are received within the next few days. The fate of the building, therefore, hangs upon the response the public may make to this appeal to support the preservation scheme.

About 48,000*l.* has been subscribed by the citizens and general public within a few days. The balance to make up 120,000*l.* remains to be provided. It is clear by the great number of small subscriptions which are coming in that the public interest extends even to those of very limited means. Thus there is no room to doubt that the total amount will be ultimately forthcoming. But it can hardly be expected that it will all be received in the short time now remaining.

For this reason a guarantee fund is necessary to enable the committee to close with the bank. The guarantee will only be drawn on, in any case, pro rata, to supplement or anticipate donations not received at that time.—Yours, &c.,  
T. VEZEY STRONG, Chairman.

Guildhall: November 4.

#### Municipal Advertising.

SIR,—The trader must advertise and, therefore, when our municipalities become traders it is not surprising to find them advertising their wares, but surely we might expect them to do this in a seemly manner. At the present time the Borough Council of Hampstead have arranged for an exhibition of electric appliances in the town hall, and the method of making this known has been to placard the announcements on lamp-posts, fences, gravel bins and other public structures. I am sending a protest against this to the Council and trust that other residents of Hampstead will do likewise.—I am, &c.,  
MARK H. JUDGE.

7 Pall Mall: November 4, 1907.

#### Impermeable Concrete.

SIR,—I have read with much interest the article entitled "Impermeable Concrete" in your issue of 1st inst. With all that can be said in favour of really efficient waterproofing for concrete work, and especially reinforced concrete, I am most heartily in accord. Your statement that "it is of the first importance to protect the steel reinforcement from corrosion" merits all the emphasis it is possible to place upon it. Indeed, such protection is absolutely vital to the future safety of the structure. To drive this fact home let me quote the following extract from a report (dated September 11, 1906) to the Structural Association of San Francisco by a committee appointed to make an examination of certain cases of corrosion of metal in cinder-concrete floors:—"The cinder concrete is somewhat porous with occasional voids, and also contains coal from dust up to lumps  $\frac{1}{4}$  inch diameter. Rust spots occur in the concrete, and where such spots are in contact with the metal, the corrosion is severe. The rust spots are sometimes an inch

across, quite soft and easily removed by the finger nail. Occasional splinters of wood occur in the concrete, which shows that the heat was not severe, as the wood is not charred. From the position of the floors it is certain that no water has reached the concrete since April 18, and that the corrosion was prior to the fire; but it appears to be more marked where floors have been exposed to rains since the fire. The corrosion is irregular in amount. In some cases the expanded metal is only slightly rusted, and in places it is entirely destroyed; several places were noticed where a small semicircular patch had been removed from the edge of a metal strip; also at times it crossed the surface of the strip in a line, which suggested that it followed a surface crack in the metal. There seemed to be a tendency to corrosion at certain points in the diamond mesh, which would indicate that the metal had been strained in the process of setting and expanding, but there is not positive proof of this.

The extent of the corrosion is great enough to seriously endanger the safety of the floors, and it is not probable that the floors would have supported their loads more than one to three years longer."

The committee recommended that their Association try to have the building laws amended, so as to exclude the use of cinder concrete in floor slabs or for fireproofing. The protection of the floor from moisture or water, however, seems never to have occurred to the committee.

This danger is present in every structure where the work is not so thoroughly waterproofed as to absolutely preclude the possibility of moisture reaching any steel or iron employed, and should be specially guarded against in the case of foundations of buildings standing in wet soil.

When we come to consider the question of the means to be employed to secure waterproofness, I wish to protest against placing reliance on "impermeable" concrete, and for the following reasons:—

1. Even assuming absolute impermeability to be obtained, it is a physical certainty that cracks will develop in the work. Even apart from any slight settlement, cracks must appear from simple expansion and contraction, and these, even though they are but hair-cracks, will be sufficient to allow moisture to enter, when corrosion of the reinforcement will at once begin.

2. It is one thing to secure impermeability in a laboratory sample, and quite another thing to secure it in actual practice. How are we to get great masses of concrete so perfectly constituted as to be perfectly watertight? Will there not always exist zones weak in quality and density?

3. In fighting moisture it is a tactical blunder to place our "first line of defence" within the material, instead of without. Why let the moisture reach the concrete at all? The only sound principle of waterproofing is insulation, and this insulation must on no account be of a rigid character, but must consist of a flexible, permanent, watertight membrane, effectually preventing moisture from ever coming in contact with the object to be waterproofed.

I should like to pursue the subject, but fear to trespass further on your space. Let me only say in conclusion that provided a satisfactory means can be found to render concrete impermeable, I see no reason why it should not be employed as an adjunct to waterproofing, if any one so desires, though I deny its necessity even then. I sincerely hope, however, that no one will be misled into accepting it as sufficient in itself.—Yours faithfully,

WM. P. GIBSON.

### GENERAL.

The Council of the Royal Sanitary Institute have nominated Mr. Edwin T. Hall, V.P.R.I.B.A., to represent them on the sub-committee of the Engineering Standards Committee dealing with cast-iron pipes for heating, ventilating and house drainage.

Messrs. Joseph Morris & Son, architects and surveyors, Reading, have taken into partnership Mr. T. Talfourd Cumming, of Reading. Mr. Cumming served articles with Messrs. Charles Smith & Son.

Mr. Alexander Colin Anderson, of Oaken, near Wolverhampton, late a pupil at Tettenhall College, has been awarded by the Council of the Institution of Civil Engineers a Miller Scholarship of 40*l.* per annum, tenable for two years, and the "James Forrest" medal for his paper entitled "Electricity in Factories," read before the Association of Birmingham Students at the Midland Institute, Birmingham, in March last. The latter Association have awarded him a medal for the same paper.

Mr. Frank Cadogan Cowper, painter, was on Tuesday elected an Associate of the Royal Academy.

A Vase was found lately at Gela on which is painted the Battle of the Amazons. From the signature it is assumed to be the work of Polygnotus, by whom only three vases had been hitherto known. The figures are inset on a ground.

A Lecture on the architecture of Central Italy was delivered on Monday evening at the University of South Kensington, by Mr. Banister Fletcher.

The Surveyors' Institution will have an ordinary meeting on Monday at 8 P.M.

The Public Works Committee of the Dudley Council recommend that Mr. G. H. Wenyon (Tipton, Dudley) be appointed architect and quantity surveyor, the Carnegie library, and that he be instructed to prepare the working drawings, details and specifications for the building.

Sir William Mather, having presented a replica of a tall sundial at Corpus Christi College, Oxford, to Princeton University, U.S.A., it was unveiled by the British Ambassador last week. The original was constructed in 1584.

A Committee has been appointed by the Scottish Teachers' Association to organise a national exhibition of drawing and art work, representative of the various schools and colleges, for the third International Congress for the development of drawing and art teaching which is to be held in London in August 1908. A preliminary public exhibition will be held in the R.S.A. Gallery, Edinburgh, from December 23 to January 3, and from this exhibition a selection will be made for the congress.

Mr. Hugh Stannus has been sworn in as Under-Secretary of the Worshipful Company of Founders.

Lord Barnard, the president of the Shropshire Archaeological Society, has signed an appeal for 1,700*l.*, being the sum required to complete the repair of the upper part of the west tower of Shrewsbury Abbey Church. In the last two or three years 2,085*l.* has been collected, principally locally, and about three-quarters of the tower has been practically recased. The work has been done under the direction of Mr. Harold Brakspear, F.S.A., the well-known architect, with the approval of the Salop Archaeological Society.

The Littlehampton Urban District Council have invited certain firms of consulting engineers to state a charge for preparing a report on the proposed drainage scheme. The following were the replies:—Mr. B. Latham offered to report for forty guineas; Messrs. T. Sons & Santo Crimp's fee was fifty guineas; Messrs. Beesley, Son & Nicholls would charge thirty guineas; J. C. Melliush forty guineas; and Messrs. Willcox & Lister thirty guineas. It was agreed last week to appoint Messrs. Beesley, Son & Nicholls as engineers.

At the Opening Meeting of the Glasgow Archaeological Society Professor Sir William M. Ramsay, of Aberdeen University, is to deliver an address, on the invitation of the Council, on "The Problem of a Byzantine City."

A Curious Dispute has arisen between the vicar and parishioners of St. Mary's, Dorchester, and the bishop of the diocese. The parishioners have succeeded in purchasing a site for a new church and in raising a considerable portion of the cost of the erection. The Bishop of Salisbury, however, refuses to give his sanction to the plan, which is in the main street, where there are already churches, stating that it would increase parochial rivalry and not provide for the new districts that are springing up. The parishioners refuse to have the money used for another site, and the bishop declines to receive a deputation of them.

The Annual Meeting of the Synod of the United Diocese of St. Andrews, Dunblane and Dunkeld was held at the chapter-house of St. Ninian's Cathedral, Perth, last week. The Primus said that during the year they had a number of gifts for their cathedral. There was a very beautiful new window in the north wall of the cathedral, and were promised a chapel at the south end, where foundations had long been prepared. Two persons had anonymously promised 11,000*l.* for the completion of the cathedral. They knew, there had always been great trouble about the foundations at the west end, and there was every prospect that now they should be able, by carefully devised plans to put up a good tower and alter the whole appearance of the west end, besides doing away for ever, he hoped, the anxiety about the foundations of the cathedral.

## THE WEEK.

As mentioned last week that Mr. CURTIS BENNETT ordered the payment of 300 guineas as costs by Chelsea Borough Council to the Underground Electric Railways of London, Ltd., in respect of the relating to the issue of smoke from a generating chimney. The early history of the action has been given in a report by Dr. PARKES, the medical officer of health. Last year the Borough Council took in a similar action, and they were not anxious to repeat the experiment. Complaints from people living in the neighbourhood of the station continued, and the London County Council was invoked. The High Council were informed that if they did not order to act they would be declared to be "a nuisance authority" under the Public Health Act, and the London County Council would undertake prosecution. Dr. PARKES considers that under the circumstances, and as, moreover, "the area affected by the operations of the Lots Road generating station is one that extends beyond the boundaries of the borough of Chelsea, and the question of abating the pollution of the atmosphere by smoke affecting the whole metropolitan area, the London County Council be asked to furnish a substantial contribution to the costs incurred by the Chelsea Council in recent proceedings." He also offers a suggestion that it may be of use when other authorities enter no proceedings. "As one of the reasons for the dismissal of summonses was that there was a failure to prove that the smoke was 'black,' it is evident that in any future proceedings it will be necessary to take detailed observations of the smoke emitted, and to bring to the court photographs, charts and tinted glasses which will enable the magistrate to see the exact conditions prevailing at the time of the observations."

TESTIMONY to the disinterestedness of Dr. NAVILLE was rendered at the meeting of the Egypt Exploration Fund on Tuesday. Mr. GRUEBER, the honorary treasurer, said that during the seasons that Dr. NAVILLE had been excavating the site of the eleventh dynasty at Deir-el-Bahari he had given his services entirely gratis. Knowing that the Fund was making an effort to carry out a work which was dear to him, he did not even ask for his travelling expenses. He had also continued to furnish the Fund with a series of memoirs. Dr. NAVILLE had completed a great work at Deir-el-Bahari, which, with a break in 1902 and 1904, had occupied him for fourteen years. It was a work which would hand down the name of the explorer to posterity. A vote of congratulation to Dr. NAVILLE on the completion of his great undertaking and the Fund's hearty and grateful thanks to him for the great services he had rendered was proposed. In the address included the name of Mdme. NAVILLE, who had been associated throughout in the work and who had been aided by her own hands so many beautiful and highly artistic plates to the memoirs. It is needless to say the vote was carried by acclamation. Such a demonstration as Dr. NAVILLE and Mdme. NAVILLE cheerfully given is the best kind of evidence of the sincerity of the *entente cordiale*.

The obligation to set up fencing in order to enclose dangerous machinery is generally approved. But the question often arises, "Who are to be protected?" There are some people who would say that those who are most exposed to harm are workmen and others who, having no actual business with the machine, are to be ignorant of its danger or to underestimate the risks of interference. A case was heard at the Man-

chester Assizes on Monday in which a young workman claimed damages for the loss of three of the fingers of his right hand, which occurred, it was alleged, through neglect to fence a revolving wheel. The defence was that he had no duties to perform in connection with the machinery, and that the injury was brought about by a breach of duty on his part. Mr. Justice PICKFORD, who heard the case, said his reading of the statute was that there was no obligation to fence as against a person who was a wrongdoer—who had no right to go to the dangerous place at all—but it did impose an obligation to fence as against anyone who in the ordinary course of business, even negligently, might get injured. The danger—if it was dangerous—must mean danger to persons using the machine in the ordinary course. If it is dangerous only to someone who has no right to go there—who makes it dangerous by opening a door which he ought not to open and by putting his hand where he has no right to put it—his Lordship questioned if it is "dangerous" within the meaning of the statute. The jury must be satisfied that it was dangerous to an ordinary workman who had to work at or near it, and who would exercise only ordinary care—or ordinary carelessness, as the case might be—of an ordinary workman. If dangerous in that sense the machinery must be fenced, but it had not necessarily to be fenced against one who thrusts his hand into danger, first opening a door which it was no part of his duty to open. He asked the jury to say whether this accident happened through dangerous machinery being insecurely fenced without substantial contribution by the plaintiff's own negligence. As a matter of course, the jury found a verdict for the defendants. It appeared the plaintiff would still be entitled to compensation under the Workmen's Compensation Act.

JUDGES have sometimes inspected premises which were affected in light and air cases. If they also deem it their duty to interfere in cases of vibration through dynamos, they will have disagreeable duties to perform. His Honour Judge GYE, of the Portsmouth County Court, a few days ago gave an account of his own experience. In the new Hippodrome is an engine for generating electricity, which the occupier of a neighbouring house said was a nuisance. The Judge visited the premises and found that there could be no question about the vibration, the effect of which on him was a heavy depression which lasted the whole time he was there. Counsel for the proprietors of the Hippodrome stated he proposed to call witnesses to prove there was no vibration. To which the Judge replied:—"If all the engineers in Portsmouth were to come and say there was no vibration it would not make any difference to me. I was there, and I was vibrated." His Honour afterwards remarked that in any case of the estimation of damages by experts there could always be found half a dozen gentlemen on the one side to say that the injury was something enormous, and there were always to be found the same number on the other side who would minimise it to any extent. The most satisfactory thing was to go and view it oneself, and that he did with the assent of both sides. Under such circumstances it is needless to say an injunction was granted to restrain the Hippodrome Company from working the engine, and a sum of 30*l.* was allowed in damages. On account of the great strength of the foundations, it appeared that the vibration was not so susceptible in the immediate proximity of the engine, but was more marked in the adjoining house, where there was constant clattering of the doors and windows, and where if continued it must have an effect upon the nerves of the occupiers little short of maddening. Electrical engineers have therefore an opportunity to render a service to the public if they can devise some means by which engines will not become nuisances to people who derive no benefit from the power.

## THE WATER-COLOUR SOCIETY.

WE cannot recall any exhibition of the Royal Society of Painters in Water-Colours containing so many representations of architecture as are now to be seen in the Pall Mall Gallery. They are produced not only by artists who are accustomed to that class of work, but by other members whose subjects are usually of a different class. The architectural draughtsman will find it advantageous, as well as interesting, to study the varieties of treatment, and in that way the coloured drawings in the architectural room of the Academy may be improved.

One of the first drawings to attract attention is "The North Atrium of St. Mark's, Venice," by Mr. T. M. ROOKE. It is to be presented by subscription to the Birmingham Municipal Art Gallery, and is solidly painted as if for endurance. It also suggests the style adopted by the early builders. They were no doubt earnest men, but their hands were heavy, in the decoration as in the construction, and this fact is revealed by the manner of drawing. The subject was well adapted for Mr. ROOKE's peculiar style. A "Door, Church of the Carmine," is another of his examples. He also gives a view "At the Back of the Scuola di San Rocco" and one of "San Nicola dei Tolentini," which is a curious specimen of architecture. The subjects selected by Mr. REGINALD BARRATT are generally more familiar. He has chosen a point of view for representing "Sta Maria della Salute" which allows only the dome to be seen, instead of the well-known façade. There is an "Entrance of St. Mark's," but it serves as a background to one of the bronze standard holders. The view from the public gardens suggests Venice on a sunny day and is, in some respects, the most successful of Mr. BARRATT's eight drawings. The "Colleone Statue" appears better when there are no houses to dwarf it. In the small drawing, "Tomb of Hosea on the Tigris," Mr. BARRATT has entered a country which is less known than Italy. The veteran Mr. CALLOW has a view of the Contarini Palace, the Rialto, the "Traghetto, St. Gregorio," besides others from Italy, France, England and Scotland, all of them being characteristic examples of old-fashioned scenic work. There are several views of Venice by Mr. H. S. HOPWOOD. St. Mark's asserts itself in spite of his blottesque manner, which is not favourable to suggesting detail. "The Cloisters of San Francesco" is preferable, and the perspective is well managed. Two views are given of "Sta Maria della Salute;" there is also an excellent drawing of "San Giorgio Maggiore." Mrs. ALLINGHAM has a drawing of a Venetian archway with a graceful figure of a girl in the opening, which, although a new experiment, suggests the character of well-dressed ashlar, which differs much from her customary cottage walls. Mr. W. M. HALE has likewise been tempted to represent "San Giorgio Maggiore." Mr. GOODALL has two views, one of the "Piazzetta of St. Mark" and the other of a "Street in Cairo." It is needless to say that Miss CLARA MONTALBA continues to be loyal to the city of the old Doges, and this year contributes three scenes. No city in the world has been so fruitful in subjects for members of the Society, but modern amateurs continue to find as great delight in the Renaissance buildings as their predecessors. Venice has lost much by modern improvements, but it still seems to be almost inexhaustible for the artist.

Mr. S. J. HODSON, who is always most careful in his representation of Italian architecture, contributes a fine view of the "Campanile, Sienna," and of the "Piazza Mercato Vecchio," in which the top of the tower is visible. But this year London also has afforded him subjects; he has an excellent view of "Westminster Bridge and the Houses of Parliament," as well as Dieppe, Blois and Winchester. Painters as a rule do not care to adopt too modern subjects. Mr. HERBERT MARSHALL has had the courage to show the "New War Office

Buildings," but they are made to appear too cramped in perspective. Waterloo Bridge, Billingsgate and minster are among the subjects shown. Evidence has been attracted by the river, for there is a view "The Pool from the Tower Bridge;" some Dutch also introduce running water. It is difficult to see Mr. R. W. ALLAN from views of small Scottish houses, and his style of drawing seems to be suited to primitive construction in wood and stone which is found in the North. Among the surprises of the exhibition are his scenes of Japan. As regards colour, it must be allowed that the browns, blacks and blues are familiar, and when we recall other Japanese drawings, native and foreign, it is difficult to avoid doubt whether the artist's eyes have recognised all that is before him. Effective as is his method, it seems better fitted for breakwaters of rough stone than for the slight wooden structures found in Japanese tea gardens or the fanciful pagodas and temples. But Mr. ALLAN's power in rendering impressions is well adapted to suggest the crowds going up and down the streets, shrines, and groups of Japanese holiday makers does more justice to himself in "Roseheart," which is very dull in colour, recalls the North.

It would be interesting to discover whether the majority of visitors to the gallery will accord attention to the architectural drawings. They are likely to prefer such a treatment of buildings as is seen in Mr. ALBERT GOODWIN's "Abbey Garden," a noble tower with delicate details appears more as an object in the background, or his "Sienna," "Windsor." Landscape this year has attained a high standard. The President's "Misty Morning," "Weald of Sussex," "Suffolk Heath," "Garden" and "View near Pulborough," although on a small scale, possess his usual qualities and if country air had blown over them. Mr. C. WHAITE remains loyal to Wales, and his "Pool, Bettws-y-Coed," is among the successes of the year. Mr. JOHN PARKER has not only followed other members in showing an interest in buildings, but has a remarkably pleasant drawing, "Sunset, Brighthelmston," and a view of Chanctonbury Ring. We hope Mr. CLAUSEN does not intend to devote himself to the painting of hayricks. There are two in the gallery, seen at twilight having a side in absolute darkness, the other under a fierce glare of sunshine. He also contributes "A House at Pompeii," but his sombre "Night" is his most successful work.

It is satisfactory to find that mural decoration still affords an occasional commission to an artist. Mr. LOUIS DAVIS shows two studies for panels in a Castle, one for a chapel in Wynyard Park and one for Paisley Abbey. They are not to be judged by neighbouring drawings. But the figures are well arranged and expressive. Near one of them is Mr. SULLIVAN's only drawing, "Once upon a Time," in which we see a number of girls dressed in white, seated on grass and with a magnolia in full bloom as a background. The figures are well modelled and, although the colours are restricted, the drawing asserts the contrasts between the white flowers and the foliage of green and white. Another successful work of the new Associates is Mr. S. C. VOSPER's "A woman kneeling at the side of a bed in a garden," a pick and shovel which lie against the wall may be a lost companion or the toil which has to be undertaken. But although the face is concealed, the suffering is manifest, and the light and shade is treated with a master's hand. "A Mill Interior" indicates Mr. VOSPER knows where his skill lies. Mr. BELL's "Go, lovely Rose!" recalls Gibson's cards by the introduction of a Cupid at the feet, while the grave lover is partly concealed by trees in the background. The "Fighting for Life," by Mr. A. E. EMSLIE, showing a rescue by a lifeboat, is marked by unusual power, and is dramatic, though being exaggerated. Mr. ARTHUR HOPKINS's

stabelle" is a lady with a stiff Mediæval head and wearing a robe ornamented with an Eastern ol. It would be well adapted for an engraving in ink of beauty, if such a publication appeared in our Mr. F. C. COWPER's election as an Associate impart additional interest to his "Margaret and Spinning Wheel." As in his Academy picture, importance is given to the window near which the seated. She wears a very long pearl necklace, portrays a good type of a German girl, whose is heavy is not her heart, "Mein armer Kopf ist errückt." Mr. H. E. CROCKET's "Like Butterflies free on the Moor," a girl with a dog, somehow "Diana of the Uplands." Mr. GLINDONI's "Screen from the 'School for Scandal'" contains a large amount of work which is carefully executed throughout. It appears to have missed the point of the comedy the characters do not correspond with SHERIDAN's options. Mr. J. C. DOLLMAN's "Pied Piper of Hamelin" is novel. He is a venerable old man, without suggestion of the mountebank. He has just led children inside the wondrous portal of the cavern. Instead of advancing he is seated, and the children gathered round him. They are all ably drawn, such expression on their faces as might be expected of those who are about to enter the joyous land where parrots were brighter than peacocks and the bees were without stings. Who can say whether they were disappointed? There is now at least no disappointment awaiting the visitor to the old room in Pall Mall East.

## HERALDRY AS ART.\*

LORD MAYOR'S procession such as was witnessed on Saturday would lose much of its interest as an annual pageant if the heraldic banners, companies, aldermen and various worthies were omitted. To students of heraldry, artists and archaeologists a great many of them are absurdities. But with all their defects they recall a time when the right to bear arms was considered honourable by citizens. It dares anyone who cares to pay the revenue duties to have not only as many representations of arms as he likes, but he can have them invented for him by heralds and so-called heraldry painters at a very small cost. To the multitude one coat-of-arms is as good as another. Heraldry has come to resemble a dead language, and comparatively few people are competent to understand the meaning of its signs. One of the reasons for the discredit into which it has fallen was no doubt the extravagant use of it made by those who were over-vain of the privileges they had inherited from their ancestors. It is only necessary to look at one of the interiors represented by HOGARTH in the eighteenth century to see how a noble lord in the eighteenth century made even his crutches expressive of his rank. The tradition was continued, and when the Houses of Parliament were erected heraldry was allowed to run riot on the windows. NEMESIS would seem to have awakened, for it is quite evident that the select committee of the House of Lords, who have been considering the state of BARRY's building, would, if they used the power, clear away the elaborate pictures in the windows and substitute glass of a more simple kind which would not obscure the light. The herald, like BURKE, may exclaim, "Alas! the chivalry has gone," for it was closely connected with armorial bearings. In our time greater interest is attached to trade-marks than to crests, and it cannot be denied that there is some relationship between the two. A trade-mark, however, generally indicates a product which has its use in a peaceful age, while the knights require crests with their followers for whom the crest

was a symbol usually preferred war to peace. But heraldry was for a long period so intimately bound up with human needs as then manifested, it is never likely to vanish altogether, for to those who take a pleasure in thinking of the past it has much signification. So long as men bear surnames they can without difficulty imagine that they are of the same family with those who having a like name became distinguished. A few years ago the public were amused when a gentleman with a ridiculous patronymic announced that he would henceforth assume the illustrious name of HOWARD. In the course of a few generations the circumstances of the change are likely to be forgotten. Should Mr. BUGG's descendants employ some of the heraldic charges belonging to the noble family we suppose few people would care to resent their daring.

If the charges are appropriated it would be better on the whole that no liberties should be taken with them. Copyists are sometimes said to treat their spoils as gipsies did stolen children, and to deface them in order that they might not be recognised. That is possible with armorial bearings. But as heraldry is remarkable for its consistency, modern imitators cannot be too accurate, for partial reproductions are one cause of absurdities. If we understand it rightly, one of the purposes of Mr. EVE's "Heraldry as Art" is to explain how errors can be avoided. He does not enter into the imaginative and delightful speculations to which heraldry lends itself, and he passes over the controversial issues which have given rise to heavier strokes and threats than were allowed in tournaments. He simply concerns himself with forms, and his book is therefore of very great utility to everyone who may be engaged in any kind of blazonry. With that object he presents a large number of illustrations. Some of them, in the eyes of a herald (although they may bear illustrious names as designers), are not of more value than the banners which once a year are borne through London streets. But they show attempts to render the science popular by a profusion of decorative elements which in an age when heraldry was in daily use would have nullified the intention and purpose of the science.

It would save many errors if those who employ heraldry were to realise its Mediæval purpose. When we know that the shield of ATHENE was adorned with a gorgon, and that the figures of warriors on Greek vases sometimes bear shields painted with fabulous or dreaded animals, we may conclude that the Greeks, like the Chinese in modern times, considered that a shield, besides defending its owner, could strike terror into the heart of his opponent. Subsequently a representative symbol of the warrior was preferred. In Mediæval days the object sought was to give personal significance. It was not easy to impart variety to armour, and generally the plain colour of the metal alone was apparent. Hence it is that even in romances we hear of black knights or knights in silver or golden armour. If the steel armour were ornamented with gilding it was not of much significance in a crowd or a combat. The shield was therefore emblazoned; but still more useful as leading to recognition was the surcoat on which arms were displayed and the crest on the helmet, which was often made very high. By that means the name of a knight or warrior was proclaimed in the midst of a battle. FROISSART relates an anecdote of a scene he witnessed in the time of EDWARD III. The English army had been vainly attacking Paris. One knight made a vow that he would strike the barriers with his lance. The next day as the English were retreating he did so, and the French knights admiring his bravery cried out to him to get away. "As for the name of this knight," says FROISSART, "I am ignorant of it, nor do I know from what country he came; but he bore for his arms gules à deux fesses noir, with une bordure noir non endentée." It was supposed to be a crime if one knight imitated the armorial bearings of another, and frequent disputes and deaths arose in consequence.

*Heraldry as Art: an Account of its Development and its chief use in England.* By G. W. Eve. With 300 illustrations. (London: B. T. Batsford.)

The peaceful NATHANIEL WINKLE on the first day of the Pickwick excursion found himself involved in a duel, because JINGLE put on the club uniform of a light blue dress coat with gilt buttons marked "P.C." DICKENS might have found the incident in one of the Mediæval chronicles.

We think the connection of heraldry with textiles should never be overlooked. The coats-of-arms which we see represented in churches, on tombs and within and without secular buildings were derived from a part of the dress of warriors and which is still suggested by the official tabards of our heralds. In that way we believe that certain limitations should be observed. Mr. EVE gives an illustration of a diapered shield from the Percy shrine in Beverley Minster. A knight who wished to be unknown might adopt something of the kind. But it is contrary to the whole spirit of heraldry. One result of the author's admiration for it is that in some of his decorative shields in gesso he introduces a sort of graining in order to impart variety to the grounds. A mason might employ ashlarling that would be similarly tooled over. But we are too conservative to accept it as a desirable novelty.

Another point bearing on this subject is that heraldry is as much an affair of colour as of form. In modern reproductions colour is expensive, especially where gold and silver have to be used. In old engravings or diagrams a series of lines was introduced to serve instead of colours. But in the case of sculptured arms reproduced by photography there is no such clue and we have only a partial representation. Colour is, however, so much a necessity in heraldic representations, it is to be regretted that there is not at least one plate of arms in their true colours, if it were only as a tribute to the art. People have of late grown so accustomed to mere black and white representations of arms they do not realise how indispensable is colour to their meaning.

The numerous references to heraldry which we find in SHAKESPEARE suggest that in the Elizabethan age the art or science was appreciated. LAERTES grounded his quarrel with HAMLET partly upon his father's obscure burial:—

No trophy, sword, nor hatchment o'er his bones,  
No noble rite nor formal ostentation,  
Cry to be heard, as 'twere from heaven to earth.

Among the embellishments of the houses at that age armorial bearings were recognised. They would seem to be at first sight no less well adapted for buildings in our time. There is, however, one great obstacle. We have no longer the old conviction that a mansion will always belong to the same family. Everything appears to be changing, and at the present time many people seem to consider that a large part of their existence should be spent on public roads. Arms are not adaptable, and a sculptured representation of those belonging to a family or the builder of a mansion would be almost a satire on a different family if they became the purchasers of it. Otherwise there seems to be evidence enough to show that arms would be eligible as ornament.

A study of Mr. EVE's pages will help a sculptor or painter to avoid errors which have become too common owing to the reliance placed on the fine lines of engravings. We think it would have been an advantage if he enabled his readers to see more of the scheme of heraldic decoration which he carried out at Alloa House and which suggests the history of a family in the thirteenth century. Separate devices are given, but the whole plan would be an additional recommendation for that class of ornament. In the panels a happy mean has been found between the severities of which the herald approves and the freedom which is expected in decoration. Mr. EVE believes in heraldry, which is not always the case with practitioners, and his book is therefore inspired by enthusiasm which is always, however, kept under restraint. If it does not overcome all the prejudices against heraldry—and they must be

strong when we find wealthy towns hesitating a few guineas for a sketch of a coat of arms—at least reveal that in its artistic forms heraldry is entitled to respect as a survival of a time prior to the invention of firearms, when individual bravery saved an empire and soldiers were the rulers of society.

### CROSBY HALL IN 1832.

THE provisional committee for the preservation of the ancient edifice have issued the following description of it which appeared in 1832, when the building was threatened with destruction:—

This building is the only considerable monument of Domestic architecture of the fifteenth century now remaining in London. Attention has recently been called to this interesting relic of past times, by the announcement of a committee of noblemen and gentlemen effecting its restoration, or at least its preservation from further decay and injury, by means of a public subscription. We are glad that this step has been taken; and that the liberal contributions of the lovers of our antiquities will speedily enable the committee, in the execution of which we observe the names of several persons distinguished in art and literature, to commence the restoration of their laudable intention. The present is hardly distinguished from the last age by its regard for relics of this description, which appeal with more force to all minds of cultivation and refinement, in character, at once as memorials of the past and as works of art, admirable on account of their intrinsic beauty. In both these respects they form not the least valuable part of what we may call the public inheritance of the country. Of that diversified wealth with which we find the country live in covered by the labours of the successive generations who have tenanted it before us. It is the fashion of many to speak of our ancestors as if we owe them nothing; we owe to them, in fact, whatever distinguishes the present appearance of this island from the appearance of New Zealand.

In London especially the preservation from demolition of such a structure as Crosby Hall would be an object well worth a little exertion and cost, as we have said, one of the few ancient edifices the country possesses; indeed, the only one, we believe, which might be pointed to as a sample of the domestic mansion of more wealthy citizens at the era to which it belongs. The Great Fire in the middle of the seventeenth century swept away all the chief remains of the past that were left of its existence. Most of what this devastation spared has since been gradually removed by the hand of innovation and improvement, nowhere so active as in this busy metropolis. It is however singular, and may be considered fortunate, that notwithstanding all this change and destruction, London still possesses in Crosby Hall perhaps the finest and most magnificent specimen of her domestic palaces.

What now remains of this ancient residence is the western and northern fronts of the irregular range called Crosby Square, on the east side of Great St. Helen's Street, and immediately to the south of the known opening of Great St. Helen's. On the western front the principal apartment, the great banqueting hall, measures 55 feet in length by 27½ in breadth, while the height of the original floor to the crown of the ceiling is 40 feet. The principal ornament of this room is its noble chestnut roof, of an elliptical form, and divided into four ancient style into quadrangular compartments by pendant beams. It is regarded as a work of great beauty, and, fortunately, it still remains nearly perfect. Between this roof and the original pavement two floors have been erected at different times, and the space is at present divided into an upper and lower room. The hall is lighted by twelve lofty windows, six on the east and six in the west front, commencing at a height of 17 feet from the floor, and divided each part by beautifully carved mullions. In the north wall is an immense chimney, a rare, perhaps singular instance of such an accommodation in these old banqueting halls, where the fire was usually placed in the centre of the hall and the smoke allowed to escape through a hole in the roof. At the north-west corner of the hall is a semi-circular recess, measuring about 9 feet in diameter, of which the commonly called an oriel, of the same height with

having also a window in each of its four sides. The and skill of the architect have been exerted with the best effect in finishing both the outside and the interior in ornamental projection. Crosby Place, as it was originally called, seems to have originally extended round square; but the only other part of the building which remains is the wing forming the north front, which consists of two apartments, one over the other, the upper of which has been commonly called the council chamber. For a description of these rooms, which are in a dilapidated state, as well as for accounts of some of the vaults, which are still to be found under the hall and in the vicinity, we must refer to the "Antiquarian and Historical Notices" lately published by Mr. Carlos, one of the trustees for restoring the building.

Crosby Place was erected soon after the year 1466 on a site for 99 years then obtained from the prioress and convent of St. Helen, by Sir John Crosby, of whom little is known than that he was a grocer and woolman, who attained the dignities of alderman, sheriff and member of the company, represented the City in Parliament, after accumulating a large fortune in trade died in 1500. But Crosby House derives its chief celebrity from the fact that after his death became the residence of the Duke of Gloucester, afterwards Richard III. It is introduced as the residence of the Duke and Lady Anne, and again in the third act, where, in dismissing Catesby, Shakespeare mentions it as the place where both himself and Buckingham would be found in the evening. It is strange that Mr. Carlos, in a publication designed to excite an interest in this old mansion, should have fallen into the error of denying that the great dramatist had any better claim for making Crosby Hall "the scene of any of the actions in which this usurping and unscrupulous prince was engaged," than "some association existing in his own mind," derived, this writer is pleased to imagine, merely from his having "seen and admired its beauties," when he had been admitted on some occasion in the humble capacity of a player to entertain the guests assembled in the "council hall." No historical fact can be better established than that of Richard's connection with this house. The old chroniclers mention it as his residence; and Sir John More expressly informs us that it was here he held the great council of his partisans the object of which was to determine the measures of the other council which he kept at Leicester elsewhere, under a show of making preparation for the coronation of the young king. This is the double meaning to which in Shakespeare's play Buckingham alludes when he refers to the scene already referred to, where he says to Catesby—  
"We to-morrow hold divided councils,"

having desired him to summon Lord Hastings to the

"To sit about the coronation."  
Probably the room called the council chamber has derived its name from having been the scene of these dark transactions.

After the dissolution of the religious houses, Crosby Place was confiscated to the Crown. It was afterwards tenanted successively by several wealthy merchants. Sir John Crosby, who was Lord Mayor in the time of the Protector, was the last person by whom it was used as a dwelling-house. It appears also to have formed occasionally the residence of foreign ambassadors. It had thus, in the honour of being occupied for a short time by the Duke of Sully, then bearing the name of the Duke of Rosny. In the latter part of the seventeenth century a greater portion of the building was destroyed by an accidental fire; and in 1677 other houses, those now occupying the site, were built on the ruins which the fire occasioned. In 1672 the hall was converted into a Presbyterian meeting-house. After the dissolution of this another congregation of dissenters met in it till 1778. Afterwards let as a warehouse, and the lease having expired last year, it is at present untenanted.

## THE HAMMERSMITH BATHS.

ON the 7th inst. the new baths and washhouses erected in Lime Grove, Shepherd's Bush, from the designs of Mr. J. Ernest Franck, 11 Pancras Lane, E.C., were opened by the Mayor. The site was purchased from the Latymer Governors at a cost of 3,000*l*.

The following is a summary of the accommodation afforded by these baths and washhouses:—First-class swimming pond, 105 feet by 34 feet; second-class swimming pond, 100 feet by 30 feet; 63 slipper and lassar baths divided into classes as follows:—Men's first class, 6 slipper and 8 lassar baths; men's second class, 12 slipper and 16 lassar baths; women's first class, 3 slipper and 4 lassar baths; women's second class, 6 slipper and 8 lassar baths; public washhouse fitted with 30 washing stalls, 30 drying horses, 3 hydro extractors; ironing-room; establishment laundry; boiler-house with coal bunkers adjoining; engine-room, engineer's workshop and store; three ticket or pay offices; male and female staff mess-rooms; club and waiting-rooms; superintendent's residence; engineer's residence. The whole of the accommodation has been provided on the ground floor, with the exception of the residences for the superintendent and engineer and the committee-room. As these rooms on the upper floors are placed along the frontages to Lime Grove and Scotts Road, windows can be used for lighting them and the rooms under, while for all the other rooms and corridors direct top lighting can be adopted. The administrative portion of the building occupies the frontage towards Lime Grove and has the ticket office in the middle of the front, with the women's entrance on the left and the men's on the right.

The large hall or first-class swimming bath is so planned as to be used either by men or women. It is provided with a gallery on three sides, that on the east end having three tiers. A separate staircase for the use of swimmers or any spectators is provided at the east end, under direct supervision of the attendant.

The bath pond, which is constructed in reinforced concrete, having walls of an average thickness of 7 inches, is of a unique character, in that 34 feet from the deep end it has been sunk to a depth of 8 feet, so as to allow of exhibitions of high diving; this deepening has been carried out in hopper formation, that there may be no extra working cost entailed in the heating of the water. This bath will be provided with a diving board divided into four tiers, and is also fitted with folding teak dressing-boxes, so arranged that when the bath is used for entertainments these can be shut against the walls.

The lighting of the bath is by a skylight in the roof and large semicircular windows placed in the end walls. The roof, which is semicircular, is supported by roof principals carried out in reinforced concrete, and is one of the first to be so constructed in this country; the bays in between the principals are in moulded plaster attached to concrete purlins. This type of construction has been necessitated by structural reasons and has many advantages, such as being more fireproof than any other type, greater durability and no maintenance.

The side cantilever galleries and that at the end of the bath are also carried out in the same material and form an interesting example of this construction. When the bath is converted into a public hall by the temporary floor, the continuity of the segmental character of the roof across the skylight is carried out by means of glazed iron sashes made to slide; this will add to the acoustic properties of the building, as well as enhancing the architectural effect. The walls are built in glazed bricks, the cornice and architrave being in Carrara ware.

Ample exits are provided, not only by the ten-foot corridor giving access to Lime Grove, but also by four exit doors into Scotts Road.

The second-class swimming bath is slightly smaller than the first-class bath, the water being 6 feet 6 inches deep at the deep end and 3 feet 6 inches at the shallow end. This is fully equipped with small foot baths having hot and cold supplies and spray, as well as a separate hot and cold shower bath. It is fitted with dressing cubicles formed of slate with fixed seats and racks for clothes. The roof is carried by means of steel principals, and the bath is lighted by a large skylight for its full length. Separate club-rooms, lavatory and attendants' compartment are also provided, the club-room having a secondary entrance from the corridor giving access to the bath.

The private baths have been fitted with spray or lassar baths as well as the ordinary slipper baths. The divisions of the cubicles are formed with enamelled slate, the doors

Meeting of Wick harbour trustees was held recently, offers for the construction of the proposed harbour at Wick were considered. The offers ranged from 10*l*. to 176,000*l*. The offer of Mr. Nott, London, being the lowest, was accepted, for 106,819*l*. The trustees have promised a loan of 70,000*l*. and a free grant of 10,000*l*. They agreed, subject to the approval of the Loan Committee and the Board of Trade, to modify the proposed new harbour to bring the cost within the sum at their disposal.

being in enamelled oak and the floor in granolithic. The baths themselves are of white glazed fireclay of the parallel type, finished with teak rim and fitted with an anti-concussive type of bath valve which has been adopted after being tested in competition with others, and altered to the special requirements of the architect.

It is enclosed in a vitreous enamelled iron casing, and the bib projecting over the bath is also vitreous enamelled, so that there is no polishing necessary. The fittings are actuated by an attendant from outside the compartment by means of a loose key. These are so arranged that only a slight turn is necessary; first cold water is obtained, next tepid and then the hot at any temperature desired. There is an arrangement in the valve which prevents the hot being turned on fully, so as to prevent scalding, and by which the highest temperature that is required can be obtained. These fittings have been supplied by Messrs. Doulton & Co. The waste is worked by a key from outside the compartment; it is large, to allow of quick emptying, and the plug is under a fixed grating. The lassar shower

The public laundry, 38 feet by 32 feet, has a separate entrance from Scotts Road, which gives access to a waiting hall where perambulators, &c., may be left. The washhouse itself is entered from this inner waiting hall. It is well lighted by a skylight and a window in the wall, and contains accommodation for thirty washers. Each stall is fitted with one closed steam boiler with steam and exhaust pipes taken into ducts built in the wall, and washing and rinsing troughs, each being supplied with hot and cold water. One hydro extractor is provided for ten washers. The drying horses, of which there are four, are of the usual type, and are divided into bays containing five horses, so that it is not necessary when the premises are not fully used for the whole of these horses to be used. The means taken to dry the clothes is by hot air forced through into the exhaust ducts by means of electrically driven fans. A powerful exhaust ventilator has been fixed in the gable wall to extract foul air. The ironing-room, also entered from the inner waiting hall, is fitted with one box mangle, three roller mangles, and

THE HAMMERSMITH BATHS.

baths are fitted in separate cubicles divided into dressing and bathing-rooms, and have a glazed ware foot bath placed beneath the shower. The valves used are designed to supply a perfectly blended stream of water to any required temperature at one movement of the lever handle. There are two to each fitting, one for the shower and a larger one for supply to the foot bath. The shower is 8 inches in diameter, with a removable face plate for cleansing, and the shower has a swivel joint so that it can be turned in any direction required. There is a dial on the face of the valve marked cold, tepid and hot, and a pointer to the lever handle, so that the user knows exactly the temperature he is getting. Cold water must be turned on first, then tepid and lastly hot, but, as before described, if necessary, the valve can be made so as to limit the amount of hot water and thus prevent scalding; these are also supplied by Messrs. Doulton & Co.

stove and the usual ironing tables. The box and roller mangles are electrically driven.

The establishment laundry is conveniently placed in a central position as possible for the collection of the clothes from the various baths. It is situated next to the waiting hall and close to the boiler-house, and is fitted with rinsing and boiling troughs, two washing machines, a hydro extractor, a four-roller ironer and drying horses.

The whole of the machinery is driven by an electric motor, and the current for this motor, and also for the motors driving the machinery in other parts of the building, is supplied from the Council's mains.

The engineering scheme has been kept as simple as possible consistent with supplying the various services in an adequate manner. All the mains for steam and cold-water supplies, and also the low-pressure hot water and steam mains for supplying the various radiators

the building, are carried in the subways beneath ground floors. The cold-water supply mains are in te; both hot and cold supplies to baths, &c., are into sections, so that in case of repairs being d one section only has to be shut down, also by means no more baths than are necessary need be put e at one time, so saving steam and fuel consumption. electric wiring has been carried out in the most and-simple manner. The whole of the wires are in galvanised steel conduits, the whole system screw jointed, mechanically and electrically con- and earthed from each fuse board and intake Those portions of the building for which a music ncing license has been applied for are wired in nce with the standing orders of the London County and are also provided with an alternate system of by means of gas under the same regulations. frontages have been carried out in red brick with stone dressings, the roof being covered with slating. The whole wall surface of the swimming public washhouse and establishment laundry are

supplies, heating calorifiers, &c., and also the plenum system of heating the large hall or first-class bath. The whole of the fittings in the public wash-house and the establishment laundry have also been supplied and erected by Messrs. D. & J. Tullis. The three Lancashire boilers, 22 feet by 6 feet 6 inches, have been supplied by Messrs. Bowes, Scott & Western, of Westminster. Messrs. Spagnoletti have carried out the electric lighting and power installation.

The fire hydrants were supplied by Messrs. Merryweather & Sons, the calorifiers by Messrs. Royle & Co., Ltd., the radiators by Messrs. C. P. Kinnell & Co., the electric fittings by Messrs. F. & C. Osler, the gas installation by Messrs. Edgars, the artificial stone to chimney-shaft by the Hard York Non-slip Stone Co., the boiler seatings and brickwork to same by Messrs. Poulton of Reading, the arc lamps and motors by the Westminster Engineering Co., the outside arc lamp brackets by Messrs. E. Keeling Teale & Co., the electric clocks by the Standard Time Co., Ltd., the constructional ironwork (including roofs) by G. Aston & Son, the cement by the Associated Portland Cement Manufacturers, Ltd., the glazed bricks and linings to swimming ponds by the Farnley Iron Co., the facing bricks to front by

private baths, corridors and other rooms are finished does in glazed bricks to various heights, the upper of the walls being finished in sirapite.

front portion of the entrance corridors in Lime the entertainment entrance hall and corridor and om No. 1 have dadoes carried out in plain coloured om special designs of the architect. The greater of the floors of the building is carried out in , the exceptions being the floors of public wash- and also those of the private bath cubicles. The ys of the swimming baths are covered with non- g ribbed tiles, supplied by Messrs. Pilkington & Co.

clerk of works, Mr. Archibald Brown, has supervised ction of the building since the commencement. The of the reinforced concrete work, which comprises f of the first-class swimming bath, all the suspended both swimming ponds, the storage tank for cold has been carried out by the New Expanded Metal ny, who tendered for this work in competition with rms. Messrs. D. & J. Tullis have carried out the engineering, including all steam, hot and cold-water

Thomas Lawrence's T. L. B. bricks, the stonework to fronts and lettering on stone by C. W. Courtenay of Fulham, the carving by F. E. E. Schenck, the faience ware to first-class swimming bath by Doulton & Co., Ltd., the tiling to walls of entrance corridors by Craven, Dunnill & Co., the fibrous plaster by F. De Jong & Co., the fire-grates and mantels by Bratt, Colbran & Co., the iron casements to front by W. T. Allen & Co., the iron casements to skylights by Gardiner & Sons, the iron sliding lights to first-class bath by the Crittall Manufacturing Co., the glazing to roof by the British Challenge Glazing Co., Ltd., the fanlight openers and special bolts to dressing-boxes, by W. & R. Leggott, Ltd., the locks, finger plate and indicating bolts by James Hill & Co., the panic bolts and door springs by Smith & Turner, the water-closets and lavatories by J. Tylor & Sons, Ltd., the wrought-iron railings to first-class gallery and grilles by Lockerbie & Wilkinson (Tipton), Ltd., the porcelain baths (both slipper and lassar) by the Farnley Iron Co., Ltd., the iron manhole covers and gullies by Messrs. John Jones & Co., and the Sheradised iron railing to first-class swimming bath by Messrs. C. P. Kinnell & Co.

The general contractors were Messrs. Charles Dearing & Sons, Ltd., Clarence Works, Halliford Street, Islington. Their tender amounted to 45,000/.

## NOTES AND COMMENTS.

IN commenting on Mr. Justice KEKEWICH's decision respecting a block of flats in Salem Road and Moscow Road, Paddington, one of which is 40 feet and the other 52 feet wide, we said that the case suggested a more liberal interpretation of the Act, especially in cases of old streets which originally were narrow and which had been widened subsequently. The buildings, which were erected without the approval of the London County Council, were 40 feet high to the gable. But the gable consisted of two storeys and was 20 feet higher. The question to be decided was whether such a building exceeded by its height the distance to the opposite side of the street. Mr. Justice KEKEWICH held that the Act said nothing against starting a building with a low height in front and then working backwards by steps increasing in height. Architects were entitled to adopt that arrangement when they could do so without offending against the Act. That was a judgment in favour of the defendants. The plaintiff appealed. Their Lordships said they differed from the definition and construction of Section 49 of the Building Act of 1894 by Mr. Justice KEKEWICH. But they considered that the defendants should be allowed to apply to the London County Council for consent to the erection of such a building, and that the other points should be permitted to stand over until the result of the application became known. The inference to be drawn is that without special consent a building could not be erected which exceeded in height the distance from the external wall to the opposite side of the street.

THE restoration of churches is so difficult, if architects could have their way such works would be confined to a limited class of builders. A practice which is equivalent to training is required of each workman. It is, therefore, a hazardous undertaking for the Corporation of Dundee to carry out the restoration of the city churches which they are required to do by law but which has been too long neglected. Dundee may have succeeded in collecting a band of workmen for everyday duties under the surveyor. But, speaking generally, no one who is careful to preserve the character of a church would seek for the bricklayers, masons, carpenters and plasterers among Corporation officials. The master builders of Dundee sent a deputation to the Corporation to protest against the enterprise. They considered it would have been cheaper if the work was done by contract. That is probable. But in works of restoration the "nicely calculated less or more" should be ignored. What is needed is that the work should be done by picked operatives. Unfortunately, that side of the subject received no attention. Some of the councillors were sure that they could buy the materials at from 10 to 15 per cent. below the price charged to contractors, while others said that because the master builders rightly declined to name a price for such work, it was better that the Corporation men should take up the restoration. It must be devoutly wished that when the work is completed it will be of a character to sustain ordinary criticism.

AFTER the action taken by Messrs. PEARSON & Co. against the Corporation of Dublin had gone through the Irish Courts, where the decisions seemed to resemble a game of see-saw, and was carried to the House of Lords, it was sent back to Dublin for retrial. No doubt lawyers and the public anticipated another series of varying decisions; but the Corporation at the last moment resolved on doing what should have been done at first, and have offered to pay Messrs. PEARSON 5,000*l.* within one month and taxed costs. It was stated by one of the counsel for the plaintiffs that fraudulent mis-

representation on the part of the engineers Corporation had not been alleged, and there was evidence forthcoming to sustain such a charge. Plans can become defective without deliberate intent and whoever issues them as correct is responsible for the consequences. It might be merely a junior draughtsman temporarily engaged who by dotted lines suggested the existence of substantial foundations and in the meantime misled Messrs. PEARSON, and caused them to build. Nevertheless, the plans were the official plans of the Corporation, and there could be no evasion of the result. As our readers are aware, we pointed out from the first time since the beginning of the action that the Corporation of Dublin were without any grounds of defence. We protested against the waste of ratepayers' money in demonstrating that some of the Irish judges were not acquainted with the drawing up of plans and that the lines on them were to their Lordships as obscure as hieroglyphics. A more foolish defence was never put up. We hope, however, the result will be taken as a warning by public and municipal authorities, as well as by individuals, that plans can become dangerous if a contractor does not necessarily become responsible in all cases if he accepts absurdities in good faith. The leading case, THORNE *v.* Corporation of Dublin, shows how great are the existing risks, and it is necessary to increase them.

## ILLUSTRATIONS.

CATHEDRAL SERIES.—SOUTHWARK: NORTH AISLE.

L.C.C. FIRE BRIGADE STATION, QUEEN VICTORIA STREET.

THE ALDWYCH THEATRE, THE FOYER.

THE ALDWYCH THEATRE, THE AUDITORIUM.

HOUSES, PURLEY, SURREY.

NO. 1.—HOUSE AT ST. PETER'S ROAD, CROYDON, SURREY.

THE external elevations are in red brickwork with cement rough-cast with Bath stone dressings and tiled roofs. The ground floor contains a sitting-hall, dining and reception rooms, kitchen, scullery, &c., and open well staircase leading to bedrooms and bath-room, &c., on first floor, and a bedroom in attic. The site falls considerably from the side and so gives light cellars, stores, &c. The roof in front gives ample working for bath-room, large bay to bedroom. Mr. D. WALLER, Church Architect, Croydon, was the builder.

NO. 2.—HOUSE, WOODCOTE VALLEY ROAD, PURLEY, SURREY.

THE external elevations are in red brickwork with plinth and rough-cast above, with half-timbered gables, tiled roof. The contents are practically the same as the previous house, but with the addition of morning room on ground floor and one bedroom in attic. PEACOCK BROS., Water Lane, Brixton, were the builders.

NO. 3.—HOUSE, PURLEY KNOLL, PURLEY, SURREY.

THE external elevations are red brickwork with stone dressings, and rough-cast above the first floor ceiling line. It contains spacious hall, reception and morning rooms, and kitchen, pantry, &c., on ground floor; six bedrooms and a bathroom, and spacious cupboards, &c., on first floor. The House situated on crest of hill commanding extensive views across the Surrey Downs, &c. Messrs. ROBERT & BARRIE, of Tooting, Surrey, are the builders. The architect is Mr. FRANK WINDSOR.

## THE SOCIETY OF ARCHITECTS.

opening meeting of the session of the Society of Architects was held yesterday (Thursday) evening at 8 p.m., when the following address was delivered by the President, Mr. R. F. Vallance:—

"The first place allow me to thank you for the honour you have conferred upon me in electing me your President for the ensuing year. I am fully convinced that I shall receive that support and assistance from the past and future, vice-presidents and members of Council which will enable me to discharge the duties attaching to the office to which I have been elected. Thus assured, I shall sit in the chair with the confidence that the good work done in the interests of architects and architecture will be continued, and I can only say that it will be my duty to uphold the dignity attaching to the presidential office."

### *Growth of the Society.*

"On a perusal of the twenty-third annual report issued one cannot help noticing the satisfactory increase in the membership, which now stands at 844, and it is still possible to gain the privileges of membership without having passed a qualifying examination. Council uses every means possible to insure that it has thoroughly competent men of sound integrity enrolled as members. There are, however, many qualified architects who at present belong to no institution, and whom we should be glad to welcome as members of the Society of Architects, and I would invoke the assistance of members to make known to such architects our Society stands for, to point out what we have done in the past, especially towards the attainment of the great object registration, and explain the great advantages they give to that movement by enrolling themselves as members of our Society."

"I shall however be my endeavour to see that the high standard of proficiency now required from candidates is not reduced, and I look forward to the time when the means of accession to our ranks will be by examination."

"A gratifying feature is the interest which members have gone to reside abroad are taking in our doings. We already have a branch in Johannesburg, and negotiations are taking place for the formation of a branch in London."

### *Education.*

"The necessity for better means for the special education of architects is necessary for an architect, especially in our provincial towns, is very urgent. In this direction forward has been made in the formation of the section in connection with our Society, and we are indebted to Mr. C. H. Mead, the chairman of that section, for the interest he takes in the work. I must trust that the students will duly appreciate the advantages which are being made on their behalf, and show it by the advantage of the classes formed for their instruction. Students will find the information to be gained in these classes will be of great assistance to them in preparing for their qualifying examination and for their future work."

"I should like to suggest that one or two half-day sketching classes should if possible be arranged during the session. It should be found not only a very pleasant way to spend the afternoon, but should prove beneficial in many ways, as our knowledge should be based upon experience of those who have gone before, as much time as should be devoted to making carefully measured drawings of buildings of recognised beauty, and of the study of their construction, for we should remember the proportions which resulted in such noble and effective effects in the past ages still hold good to-day, and without good construction we cannot have good architecture."

### *Library.*

"It is gratifying to see the increasing use made of the library, and I should like to emphasise the note in the last report, asking for the co-operation of every member in making this very desirable adjunct to the Society's success."

### *Social.*

"The social functions which were so successful last year, in my opinion, be the means of much good to the Society and to its members individually, by cementing the ties and affording the means for an interchange of views on matters which crop up in our practice. I therefore

hope to see these continued in my year of office, and shall look for the cordial support of the Council and members generally in this direction."

### *Registration.*

"It is now twenty-one years since the idea of obtaining an Act of Parliament to make it compulsory that all persons entering the profession should be duly qualified by examination took root, and while we have not, I regret to say, yet attained the desired end, I wish it to be most distinctly understood that progress has been made and that your Council does not intend to relax its efforts in the slightest degree."

"The suggestion of the R.I.B.A. to alter its charter and by-laws does not go far enough. What we want is that it shall be illegal in the future for a person to enter the profession and practise as an architect unless he has been duly trained and passed a qualifying examination. We have got beyond the argumentative stage, and it is now generally admitted that registration or federation is right in principle and the only point at issue is how best to carry that principle into effect."

"So long as any section of the profession stand aloof or is antagonistic on points of detail to a measure which it approves in principle, progress is retarded, whereas could we go to Parliament with a non-contentious measure and a united front it is only reasonable to suppose that facilities would readily be made for the passing of an Act."

"It is at least gratifying to find that individual members of Parliament and the public generally now view the Bill with more favour, and since the best asset a nation has is a healthy population, it is inevitable that our legislators must sooner or later come to the conclusion that it is absolutely necessary for the public good that none but thoroughly trained men should design and supervise the erection of the dwellings in which our population live and the places in which they are employed, and to this end place the Architects' Registration Bill on the Statute Book."

"When this is accomplished and architects are all trained men, we shall receive the confidence of the public and of the medical profession, and take our proper place in being called upon to assist that profession to raise the general health of the people and so help in arresting the deterioration of the race about which so much has been heard in recent years."

### *Planning of Suburbs or Town Planning.*

"The manner in which new suburbs are formed on the borders of our towns, without the slightest regard to any general scheme of development, has attracted a good deal of attention during the last year or two. It is quite a common occurrence for a valuable residential district to be spoilt, say, by the advent of a colliery and the accompanying tenements which inevitably follow. So long as these tenements are erected to comply with the by-laws as to thickness of walls, strength of timbers and minimum air-space in the rear, there is no law to prevent the crowding of, say, forty houses to the acre, without forecourts or any sign by which one house can be distinguished from another in, say, a row of 100 houses, except by the number on the door. This, I contend, ought not to be possible in the twentieth century, and I am glad to see that Mr. Burns proposes to bring in a measure or measures dealing with town planning and housing reforms during the coming session."

"Let us give every credit to the promoters of the first garden city at Letchworth; we may hold different opinions as to the various buildings which have been erected there, but limiting the number of houses to be erected to the acre to twelve, the general planning of streets and open spaces, and the disposition of various classes of buildings on the area, I think we shall all admit are in the right lines."

"There can be no doubt that environment plays a very important part in the development of all forms of life, and the mere fact that such a large proportion of the population in our towns lives in such squalid houses in narrow streets has some bearing on the drunkenness and depravity often found amongst the unfortunate people enforced to spend their lives in such horrid places."

"I think this matter of town planning well worthy of the earnest attention of our Council."

### *Strand Improvement.*

"I am sorry to see that the L.C.C. still refuse to alter their decision as to the line of building frontage between the two churches of St. Mary-le-Strand and St. Clement Danes. Your Council carefully considered this question in

1906, and were of opinion that the plan suggested by the Further Strand Improvement Committee was far preferable to the L.C.C. proposal, and consequently joined in the memorial asking for the matter to be reconsidered.

As a provincial architect there has been no question of public improvement in the Metropolis which has appealed to me so strongly as this. The opportunity for giving London one of the finest avenues to be seen in any city of Europe and of opening up from the west the view of the Law Courts and from the east that of the church of St. Mary-le-Strand, appears likely to be lost for ever. No matter what the extra cost would be, now that the site is cleared I consider it nothing short of a national calamity that this opportunity for effecting such a noble and dignified improvement as that suggested by the Further Strand Improvement Committee should be lost.

#### *Competitions.*

The result of the preliminary competition for the new London County Hall has been made known, and the authors of fifteen designs selected to compete together with eight architects appointed by the County Council in the final competition. I am sorry not to find the name of a member of our Society amongst the fifteen successful competitors, but it is at least gratifying to see the names of several young and comparatively speaking unknown men amongst the fortunate; and further to know that the London County Hall will be erected from the designs of an Englishman, as no foreigner has been successful in the preliminary competition.

#### *Crosby Hall.*

I sincerely trust means may be found to preserve this historic building to the nation. If our ancient City Guilds seriously take the matter in hand, there is little doubt the necessary funds will be forthcoming, and this fine building which connects us as it were with the time before the Great Fire will not be demolished. I take the liberty of quoting from a speech of Mr. W. D. Caröe, F.R.I.B.A., delivered at a meeting held at the Mansion House when this matter was under consideration, when Mr. Caröe is reported to have said that:—

"We have before us a piece of design and workmanship executed at a period when architecture was the first of the arts, and when the individual craftsmen were artists in the highest sense of the term—artists literally to their fingers' ends. It has a value of its own second to no other building in the City. As a piece of design, it may be held up for all time as a classic example of architectural skill and conception. To the architectural scholar it is a Gainsborough or a Reynolds in architecture."

#### *Architects' Benevolent Society.*

I should like to take the opportunity of reminding our members that there is in existence an Architects' Benevolent Society, which has for its object the relief and assistance of our confrères who have fallen on evil times. Is it too much to ask that all members of our Society whose circumstances in life will fairly warrant it (and I sincerely hope there are many such) will make a small annual subscription to this very deserving fund? Those members who do not care to send individual subscriptions to the Benevolent Society might, I venture to suggest, subscribe to a general fund to be transmitted through our secretary, who, I am sure, would only be too pleased to forward collectively any amount he might receive as coming from members of our Society. Gentlemen, I commend this worthy object to your serious consideration.

### VANDALISM AND INCONGRUITY IN EDINBURGH.

THE opening address of the session of the Edinburgh Architectural Association was delivered by the Right Hon. Lord Kingsburgh, K.C.B., LL.D., Lord Justice-Clerk, in the Royal Scottish Society of Arts Hall, Edinburgh.

His Lordship said he assumed they would all agree that the architect, if he was to be worthy of his profession, must be a lover of the beautiful both in nature and in art, and, further, that it would be conceded that every failure to consider congruity was in greater or less degree failure to conserve or cultivate the beautiful, and was a step in the direction of disfigurement. They would perhaps be amused with his first illustration of a building put where it ought not to be, as there was no real question of architectural skill involved. There might have been, for the place he spoke of was Dunsappie Loch, at the back of Arthur's Seat. He remembered well that the late Prince Consort—who had many virtues, but of which æsthetic taste was not one—

had every preparation made for the erection of a vera refreshment restaurant at the east end of Dunsappie. The stones for the building were actually cut and laid on the ground. Let them be thankful that there was sufficient revival of taste in, by that time, much disfigured Edinburgh to cause an irresistible outcry against the proposal. The Prince Consort was, like most Germans, wonted to hold a lager beer-house as a necessary architectural improvement to a scene of natural beauty. Lord Kingsburgh once took a German professor for a walk to Arthur's Seat, and when he expected him to say something complimentary, the professor turned to him and delivered himself in German—he translated literally:—sir, it is to me a thing altogether outside understanding how that in so near neighbourhood of a so great city should be in such a state of waste and desolation left.

But although Albert the Good could not see the erecting what he desired, yet some years later a building was put up at Dunsappie, and there it still stood to the disgrace of king, lords and commons, and every inch of Edinburgh. He referred to an erection for the storage of tools for a few weeks' work per annum. Going further afield from Dunsappie, they came to another specimen of incongruity, a specimen of a too common blunder about a century ago when pretentiousness was mistaken for style. An ancestor of the Duke of Abercorn decided to have a dwelling at Duddingston. His architect planned his building with its face to the east wind, and selling his idea for a Scottish mansion a design suitable to the sunny south. That was not all. The same architect, at the entrance of the avenue from the road, put up a three-arched gateway. This grand Renaissance gateway with its imposing arches, which, if it were the gateway of a French château, would have 10-feet walls going out to surround the park, stood alone with not a square of stonework. The whole arrangement was a mixture of obtrusive pomp and mean shabbiness, an error of display, producing a ludicrous incongruity. The more such cases within driving distance of Edinburgh, the more city architecture one found also too many specimens of incongruity leading to disfigurement. What was more glorious street, probably unequalled in the world as a situation, but a flat-faced mile of unrelieved masonry, many tenement buildings of to-day would put to shame. It never seemed to have occurred to those who built Princes Street and the adjoining streets that so fine a situation as the south side of the valley called for consideration when the north slope had of necessity to be appropriated for building.

To people to-day the earlier buildings on the north side were almost as inconceivable as it was to them to know that the Corporation of an earlier day deliberately made a decision on their minds to build a south side to Princes Street, a project which it was not too much to say would have irritated and disfigured Edinburgh æsthetically, and probably rendered it also as a place of resort for thousands from elsewhere. The occasion was one in regard to which—not a political point of view—every citizen then and since now could say from his heart, "Thank God, we have the House of Lords;" for it was only by a judgment of the House that Edinburgh was saved from such a catastrophe. Even as it was, Edinburgh did not escape scatheless from the proposed vandalism. The buildings on the site of the present North British Railway hotel were erected in defiance of the House of Lords' decision, and presented their backs to three or four generations. Had these new buildings been built it was not improbable that neither the new police station nor the railway hotel would have been placed where they are, blocking out the view of Arthur's Seat and beyond. On the other side of the valley much might have been done. An unpardonable mistake was made when the west end of Edinburgh was built in neglecting to build on the high bank of the Water of Leith as the front for a new city, instead of placing the rubble backs of Moray Place and Ainslie Place as a setting to a beautiful natural scene.

But perhaps the most fatal concession to the incongruity in Edinburgh was to be found in another terrible and mediable outrage upon the beauty of the city. What taste, where was forethought, where was good sense, in committing the valley between the Old and the New Towns to be invaded by the railroad? It was vain to pour over spilt milk, but surely one might indulge in a dream of what might have been. Looking over the acres of dirty glass roofing one might have been led to see instead a lovely stretch of garden reaching from Cuthbert's to the east of Calton Hill, the North Loch.

e sheet of water, a beautiful drive between the castle, passing the Mound by a tunnel and westward by a boulevard road out to the front of round the King's Drive, and by another boulevard then practically open ground from St. Leonard's Drive, and then, cutting a line through West of the west of the Castle Rock. It was recorded by citizen, the late Adam Black, whose statue was to add to the beauty of the terrace of Princes Street, as Lord Provost, he solemnly delivered himself to the Town Council, "Nature has formed this place a station." A more cruel libel on poor nature the lips of man. His statue should be turned to his work, and there should be inscribed on its base was a worthy man who unconsciously took the statue in vain, and in her name did what the statue below. He is gone. Don't revenge yourselves on an effigy." The Nelson Monument on Calton an instance of the evil that men do living after them trust that the designer of it did some interred with his bones. One could not even melancholy satisfaction of being able to say, "It has been worse."

placing on end of a great round rolling pin, with elements at the top, on the summit of a hill, was with another too common absurdity which disfigures a scene—the square-pointed obelisk. Lord Kingsburgh afterwards spoke of incongruities by something buildings had been erected. Dealing in this with the alteration of churches and other buildings that terrible things had been done to the great and churches by funeral marbles and brasses noble or the wealthy Christian being commanded by representations of the front of a sham sarcophagus and veil copied from some heathen tomb, good but poor, humble disciple had any tablet to his memory. Speaking of the general amenity of the town, he said the Town Council were offenders in this. It seemed not to be thought an outrage to put a black post, with a black square on the top of it, in Princes Street Gardens, to tell people that 2d. was the charge for Walter Scott's monument and 3d. the charge for the monument. He never saw anyone read what was there it was, a mean vandalism for a mean ugly splash thrown in upon the view beyond, for twopences and threepences. But worst of all lately been put up on the top of the Waverley an indescribably ugly erection, flanked by flagstaffs, shows to advertise themselves by an offensive policy. No one, if he had thought for a moment of buildings, would have put up such an abomination. It came down. And what about the placards which the Scottish Academy stuck up with battens on the Gallery railing? The Architectural Association not many months ago put up two placards the Greek pillars of the Royal Institution. In the of his address Lord Kingsburgh dealt with what the dreadful practice of caging up buildings with often ugly railings. He spoke of what had been the removal of railings, and said he hoped to live Andrew's, St. George's, St. John's, the south side High School and the front of the Royal Museum the same way. If the contemptible fences on all were removed, people would be surprised at the effect it would give as the top of the slope was ascending the hill.

The motion of Sir R. Rowand Anderson, seconded by T. Oldrieve, Lord Kingsburgh was accorded a vote. The chairman, speaking of a reference which Sir R. Anderson made to the acquisition of an old house at Holyrood by private owners, explained that the Government did their best to secure the ground, but that the competition of a syndicate the price was raised more than twice the sum originally offered. The proceedings closed with a vote of thanks to Mr. Anderson presiding.

**Dundee Morris Trust Fund** has intimated the gift of a picture to Dundee Permanent Art Gallery, one of them a Voltaire picture by Sir William Q. Orchardson, the Morris fund was established by the late Mr. J. Morris, parish schoolmaster of Mains, who bequeathed a portion of his estate as a capital fund to be applied to the purchase of pictures for Dundee Art Gallery.

## THE "NATIONAL MONUMENT," EDINBURGH.

At a meeting of the Architectural Craftsman's Society in the Technical College, Glasgow—Mr. A. L. Currie, president, in the chair—Professor Charles Gourlay delivered a lecture on "The Parthenon and its Reproductions." After referring to the beauty of Athens, its acropolis and surroundings, the lecturer dealt in detail with the architectural features of the Parthenon and its construction. Architectural design being an expression of the thought of man, no finer example of this, he said, existed than the Parthenon. The construction of such a masterpiece with all its refinements could only have been accomplished by one having technical skill of the highest order. It was remarkable that these two qualities—the ability to design and to execute—were never found in a fully developed state in one man. The architect, Ictinus, and his craftsmen produced in the Parthenon the one edifice undoubtedly the nearest to perfection of any building ever erected. Just as these architectural craftsmen worked as one individual on this building, so the architect and craftsmen of the present day ought to work in order to design perfectly and execute the very complex buildings now required. The Greek revival in architecture took place early in the nineteenth century, and as the mind of the public had just then been awakened to the beauty of the Parthenon this naturally led to its being considered worthy of reproduction in whole or in part. The two most celebrated attempts to entirely reproduce the Parthenon were both the desire to give national expression to the deeds of great men. The incomplete Scottish National Monument on the Calton Hill of Edinburgh was the first attempt, and while the reproduction of a building of a former age was deprecated, yet it was to be hoped that, as the monument had been begun, it would be completed externally according to the original plans, the interior being arranged to suit the purpose to which the building might be put. The other reproduction was the well-known Walhalla, near Regensburg, in Germany, which externally was an almost exact replica of the Parthenon, but internally was one large hall. The floor and walls were lined with polished marble, and colour was employed freely, with the result that a gorgeous effect was produced. The lecture was illustrated by a series of lantern slides as well as by drawings and photographs. A vote of thanks brought the meeting to a close.

## NEW ZEALAND EXHIBITION.

An interesting report has been prepared by Sir Isidore Spielmann, F.S.A., on the British Art Section of the exhibition at Christchurch, 1906-7. The section included oil and water-colour paintings, miniatures, sculpture in marble and bronze, black and white drawings, engravings and etchings, architectural drawings, and a representative arts and crafts exhibit, which was shown side by side with fine art. Contributors to this section included a large number of members and associates of the Royal Academy, Royal Scottish Academy, Royal Hibernian Academy, Royal Society of Painters in Water-Colours, Royal Institute of Painters in Water-Colours, Royal Society of British Artists, Royal Society of Painter-Etchers and Engravers, New English Art Club, Royal Scottish Society of Painters in Water-Colours, Royal Institute of British Architects, Society of British Sculptors, Royal Society of Miniature Painters, the Society of Miniaturists, &c. In addition to these a number of eminent artists were also represented who are not identified with any society or institution. The number of artists contributing was 531. Thirty-six private owners also lent works. The total cost of the section was 7,126*l.* 19*s.* 6*d.*, of which collecting and carriage amounted to 4,192*l.* 6*s.* and insurance to 1,387*l.* 4*s.* 2*d.*

The director is of opinion that the British artists as a rule fix the prices of their works at international exhibitions at figures which do not encourage purchasers. Foreign artists of the first rank fix the value of their works at these exhibitions more moderately, and consequently they command a more ready sale. At the Brussels Exhibition but few pictures were sold; at Paris hardly any; at St. Louis we sold for over 7,000*l.*, while at New Zealand, where prices were less high, we have sold for 17,107*l.* 7*s.* 8*d.* This he believes to be by far the largest amount ever taken for modern works of art at any international exhibition. The private purchases amounted to 7,420*l.* 14*s.* 2*d.*, the remainder was expended for public galleries in New Zealand and Australia.

Of the fifty-two oil-paintings sold twenty-four were landscapes, twenty-three subject pictures, three sea pieces

and two were portraits. Of the ninety water-colours sold thirty-one were landscapes, forty-four were subject pictures, eight were sea pieces and seven were architectural subjects. Of the fifteen miniatures four were portraits and eleven were fancy subjects. Of the 116 drawings, etchings and engravings eight were portraits, fifty-eight subjects and fifty landscapes and buildings. Of the eleven pieces of sculpture sold four were busts and seven were ideal figures. If the public showed a preference at all it was for the water-colour section, where several of the subject pictures could have been sold many times over, but architectural subjects were also much appreciated. In the arts and crafts section, pottery and glass, lace and needlework, jewellery and enamels, furniture and metalwork sold easily; but wood-carving, stained glass, bookbinding, printing and calligraphy were less understood and appreciated.

According to the director the full measure of success can only be determined later on. It cannot be gauged merely by the value of sales effected. The new reputations made, the new seed that has been sown, and the lessons that have been taught and learnt, have also to be taken into account apart from the question of direct financial gain or reward. During the continuance of the exhibition the attendances in the local art schools increased considerably, and local artists closely studied such subjects, for example, as hill formation and the like, and other characteristic features from pictures on the walls. As a result of international exhibitions works by British artists have been added to the national or municipal collections at Paris, at Berlin, Düsseldorf, Munich, &c. This propagation of British art has now been more widely extended to the galleries of New Zealand and Australia.

Among the works acquired by the Adelaide Art Gallery is Lord Leighton's "Study of a Fig Tree," which was reproduced several years ago in *The Architect*.

#### FRENCH ACADEMICAL PLANNING.

IN the *Architectural Record* (of New York) for November is the first of a series of articles which will deal with the methods of modern French architecture as applied to architectural practice in the United States, and particularly the training obtained by American students (and their imitators) in the Ecole des Beaux-Arts. The first of the papers is by Mr. J. Stewart Barney, who is, we are told, "an architect of experience, whose achievements in this country give to all his judgments a presumptive value. His opinions are those of a mature, professional man, and therefore differ essentially from the impressions or recollections of a young student." The subjoined extract will suggest the author's opinion on the system of instruction on planning:—

The following, it should be understood, is the result of careful notes taken during two years' study in Paris in and out of the ateliers, under the direction of those who were considered their strongest men, and for whose opinion I have the greatest respect, and to whom I am indebted for many of the points which I make in criticism of the methods of the school as applied to the American student. These I will not offend, as they have often agreed with me, and have always willingly given consideration to the points which I raise.

When for the first time, under the direction of one of these men, I undertook to work out one of their large problems, I was appalled by its magnitude, considering the small amount of time that was allowed me to solve the same. Although I had practised architecture in America for nearly fourteen years, this problem required information that I, with my experience, did not have. I was confident that it would require all the time allowed for the complete solution to read up on the subject and put myself in a position where I could consider intelligently the conditions governing the same. Therefore, with a very limited knowledge of the subject, and not having, at that time, entirely grasped their idea of proportion in plan, one of the most striking features of the school training, I naturally produced a plan absolutely without merit from any standpoint, and especially from theirs. I was wandering in the dark. I could not understand how it was possible to grasp so quickly the solution of so large a problem in an entirely new field, and requiring special technical information. I was very much impressed when for the first time I saw the readiness with which the advocates of this proportion system arrived at a solution.

I think I am right in saying that the student of the

Ecole des Beaux-Arts is taught to plan with. He uses a very soft pencil, or preferably a charcoal. With this on a small piece of paper and spins and spins in concentric circles until covered the entire paper with a soft grey tone, lacing lines. These he smears occasionally with his hand and in this shadowy uncertainty his quick imagination sees or devises a form which his eye has shown will be considered good. He then considers the conditions which govern the problem to fit the form. By the process of proportioning the difference of his plan he claims to arrive at a solution, and of his power of indication he renders the whole plain to the eye. The first is false, the second deceiving.

By their theories and their methods of indication not only arrive quickly at the solution, but are skilful in seeing at a glance the faults in a plan composed of others. One often hears of the wonderful skill of professors in this particular feat of telling at a glance without even reading the programme or demands of scale, what is the trouble with a plan. Considering an architectural plan as a musician would of music, their trained eye readily detects harmonic harmony or discord. They detect a false note which can as quickly give their reasons for the discord; reasons are generally the statement that this form, or combination of forms, had or had not been used in previous "concours," or having been used, adjudged good or bad. They refer to the previous "Prix" as a lawyer, pleading before the Bar, would the rulings of the highest Court.

This great facility in criticism, I think, is due to the fact that they have studied for years the expositions at the Ecole; they know by heart every decision of the jury, they know what has been considered bad and what has been considered good, they know what is now considered good or bad, they know what has been pronounced the most fashionable form, and, like a tailor, they are quick to see the possibilities in a plan. They are quick to tell whether a new form will place in the traditions of this paper-architecture handed down as something which has been tried and found good. They are perfectly sincere when they say they feel discord; but my question is always, Why do they feel this? Would they feel the same in a plan through the building constructed after the plan is considered, and as there is no possible way to obtain, after the building is constructed, a view of the plan, or a zonal section through the same, which is the same, they think they may be accused of wrongly applying their theories to artistic combinations of forms, lights and shades. Their theories are therefore just as applicable to the drawings for an automobile.

As I have said, they will criticise a plan without thinking of asking the scale at which it is drawn. They do not hesitate to criticise before asking for the conditions which govern. This was well illustrated when I criticised a set of competition drawings which I made for a New York church without asking for the conditions of competition.

When asked why they do not consider the conditions which the drawing is made, they reply, "The scale makes no difference; it is a matter of proportion." They apply this theory to the plan for a State hospital, for example. The space allotted to one patient might be that which was required by law, and they would give to the patient more cubic space than was required, more than was convenient for the administration of the building, and more than the appropriation, which would require upon scientific calculation, could pay for.

Naturally men who have been passing on principles of theoretical requirements based upon theoretical principles which have been the outgrowth of their experience, "projects" which were never intended to be executed, apt to form standards of excellence which are erroneous. From their standpoint, judging from the models which they have turned out according to their methods, which they have turned out according to their methods, they are correct, but when these methods are applied to American competitions for a building really to be built, great injustice may be done to the student who is not educated in these theories, or, understanding them, consider them worthless and refuse to be influenced by them.

By the French teaching the plan is an assembly of symbolic indications, and when rendered in accordance with their rules of shades, tones, values, &c., is as

od by their judges as would be a musical score to er of an orchestra, and establishes between them student a perfect medium of communication. The if he is a master of the art, can at will suggest to es' gayness, sadness, light and air, or absence of beautiful view or a dense forest. All of these forms of indication (chi chi) have been invented by ver schoolboys with the sole idea of pleasing and the eye of the judges, having noted in previous ns that the drawings having the most extraordinary f this kind of art were generally recognised.

meaningless, aimless, childish performance has ied on to an absurd limit, and as long as this is to the school it is a matter of no interest to us ; full-grown men, serious in their work, allow es to be forced either to study these tricks, or, if e not the time themselves, employ in their offices, itant salaries, pastmasters in this form of "plan g," in order to compete on equal terms with those e forced this sort of rendering on us in the guise of I think it is time to stop and consider.

ave said, I was very much impressed when I first of these masters of what I, for the lack of a better ll the spinning "process," dash off in this way the large problem. It was a joy to look at. His skill st magical, his arguments most convincing. I was at he at some time in the past had given a great me and study to this particular problem, but now at he did not know as much about the conditions g it as I did. When it was laid before him it was time that a problem of that particular nature had mitted to him, but with absolute certainty, the of his confidence in his theories, one of which is, at good proportion in plan produces a good plan, ly arrived at a solution which satisfied his eye, ve satisfied the eye of the committee of award, and efore pronounced by him the proper "partie" (lay- en the uncompromising facts governing this problem ight to bear upon his "partie" his beautiful pro- were lost and the plan was pronounced bad, not t did not fulfil the necessary requirements, but had proportions and was no longer, as he expressed it, y to an "indescribable feeling." To understand e scribable feeling" one must train oneself by the proportions and combinations that have in school "conours" been adjudged good by the e of award.

g now studied conscientiously this process, not an advocate of the same, I can in a few ash off a "partie" for the largest or the smallest I use the same process of "spinning" until g appears on the paper which suggests a pleasing ion of forms. This I can apply, as they do, to the a book, the lay-out of a park, the plan of an old me, or to some really great work.

st be because of their absolute confidence in the of proportions, as applied to plan, that the men in these theories undertake, without hesitation, complicated problems with conditions of which e not the slightest information. They certainly problem to their entire satisfaction by this skilful ion of large and small forms, arranged with the oducing the most pleasing plan-picture. And by ions of greys, tones, washes and values—all o more bearing upon the practical result than the effects of lights and shades which they produce on des with shadows at 45 degs.—they undoubtedly e requirements of the school. It must be said, that though they may be accused of misleading to the belief that they have solved the problem y, they have first misled themselves. It is almost le to argue separately the theory of proportion in the process of indication or rendering, as they are ly associated; the rendering being the method by oportions, which are considered good, are em- and those which might be criticised rendered g, or, if necessary, entirely hidden.

I was at work on a plan for a block-house, an st or trading station in Alaska, concerning the ents of which neither the professor who drew up tions (judging from the conditions), the professor om I was then working, nor I myself pretended he slightest information, I was told that I could by y of proportion decide the best method of fighting and that the necessary size of the block-house was e matter of proportion between it and the sur-

rounding courts, I was then tempted to pronounce their theories unworthy of serious consideration. In answer to my objections, I was told that they were not in reality attempting to design a block-house or trading station that would suit the place for which it was intended, and perhaps theirs would not be a practical solution. Then why attempt to solve a problem that required no solution? Why impose any conditions, and why call the solution an army post in Alaska? I could not understand how it was possible to consider intelligently this trading station or block-house without first having a talk with the Indian fighter. I could not see how any theories referring to the monuments of Europe could apply to this absolutely new set of conditions. I claim that if it was necessary to have theories at all in order to come to a satisfactory solution, these should be established on what the trapper would say rather than upon what Louis XIV. had already done or would do if he were called upon to build this army post. Seeing in this particular problem a golden opportunity of testing their theories of proportion, I wilfully made a block-house too small for the purposes for which it was to be used. I placed it in a position so dangerous from a strategic standpoint that I think the trapper would have refused to live in it. I entirely disregarded the safety of the inmates of the post, but having grasped the theory of proportion I studied with great care to obtain what I thought would be considered a fine combination of forms, composing with great care the different values, lights, darks and greys. These combinations, and the method of rendering them attractive to the eye, I learned by painstaking study of the "Grand Prix" of previous years. The consequence was, I was highly commended. I was told that it was pleasing to see that I had grasped the idea, and that it had always been predicted that I would "arrive." I then demonstrated that it was impossible with this "partie" to obtain the required amount of space for the different parts, having carefully worked out beforehand the amount of space which, in my judgment, they would require. It was therefore necessary for the professor to devise another combination of forms. This he readily did, and without an apparent effort obtained another more pleasing combination; but when the facts were brought to bear upon this new "partie," it was also found that it did not fulfil the requirements, and we parted without having solved the problem of how to fight Indians in Alaska. We knew nothing whatever about the requirements, and without the assistance of the trapper it was just as ridiculous for us to make a combination of forms to suit his conditions as it would have been for us to have selected for our "partie" for this army post a Turkish rug, simply because it, by its combinations of forms, shades and colours, produced a pleasing effect upon the eye.

The advocate of this system, when he has, as they say in French, "arrived," claims to be able to design by the theory of proportion the correct solution of any problem, a block-house in Alaska, the palace of a king, the house of an American millionaire, or an undertaker's shop twenty or thirty storeys high to be built in New York, to fulfil the Frenchman's idea of our requirement (Prix de Reconnaissance des Architectes Americains—school year 1905-6), without any other preparation than a good eye for proportion and a wonderful skill in indication.

#### ROYAL IRISH INSTITUTE.

A GENERAL meeting of the Royal Institute of Architects of Ireland was held in Dublin on the 7th inst. Mr. W. M. Mitchell, president, occupied the chair, and there were also present:—E. Bradbury, R. J. Stirling, J. Holloway, S. M. Ashlin, G. C. Ashlin, R. P. B. Smyth, L. H. Deane, G. L. O'Connor, R. C. Orpen, G. F. Beckett, C. H. Mitchell, F. G. Hicks, E. H. Morris and J. H. Webb, hon. secretary. The President announced that Mr. Frederick Batchelor had been elected President for the ensuing three years. The President also announced that Mr. L. du P. Millar and Mr. A. O'M. Lovell were elected members. The usual monthly meeting of the Council was held, Mr. W. M. Mitchell in the chair. The hon. secretary reported that there were at present five candidates for membership of the Institute, and that several others had been supplied with the necessary application forms. Preparations were made for the approaching election of a new Council for 1908. Four resolutions passed at a recent general meeting with regard to the best means of balloting, the advisability of holding a conversazione, revision of schedule of charges and election of President, were discussed and considered. The hon. treasurer presented a financial statement, which was approved.

## TOWN PLANNING.

THE following suggestions upon town planning have been communicated to the *Sheffield Daily Telegraph* by Mr. Edward M. Gibbs, architect:—

The practice of land speculators is to lay out an estate so as to produce the greatest possible ground rents; making the width between the fronts of the houses the minimum width of road permitted by the by-laws, and the plots of land as small as will allow of houses having the open space at the back required by the by-laws. The result is about thirty-six houses to the acre. The practice of some of the large landowners is an improvement upon this, the plots being made of greater depth, with the result of about twenty-four houses to the acre. The experiment at the Model Cottage Exhibition of only twelve houses to the acre is a success which it is desirable to repeat; but local authorities have no power to enforce it except by becoming owners of the land, a very serious responsibility, as will hereafter be shown.

The by-laws of Sheffield prescribe the minimum width of roads to be 40 feet. The method of completion of roads before being dedicated is so very costly that the minimum width of road is generally adopted, even for the most important new thoroughfares, resulting in the present absurd practice of making front roads with much traffic no wider than back roads with little or no traffic, and the whole of them of a uniform monotonous width and appearance, except for the occasional front gardens and bay windows in the better roads.

The Sheffield Society of Architects and Surveyors have suggested to the highway committee the alteration of their by-laws so as to permit of broader roads for main thoroughfares and narrower ones for less important traffic, and also an increase in width between the fronts of houses, giving the additional width to front gardens. The town clerk has replied that the Corporation have no powers to make such by-laws.

The general practice in laying out estates is not to consider the interests of the owners of adjoining estates, or of the town generally; with the result that there is frequent want of proper communication from one estate to another. The highway committee have for many years used their influence, and secured roads through adjacent estates, and have prevented the construction of many cul-de-sac roads. But I believe they have not the power they should have to require an estate to be laid out with proper regard to the development of the town generally.

Town planning, as I understand it, is a proposal to give the local authorities full powers to deal with the matters I have above referred to, viz. the laying down of a plan for the development of the town and its suburbs on a comprehensive scale, the provision of roads of width proportionate and suitable to their uses, the limitation of the number of houses to the acre and the power to purchase necessary land.

If such powers be granted, then a plan of the city of Sheffield and suburbs should be prepared providing for the future extension in all directions, with main thoroughfares from the centre of the city to each suburb and beyond, and main thoroughfares from suburb to suburb, and with secondary roads and less important roads for the development of each suburb. The main thoroughfares should be wide enough not only for tramway and other traffic, but sufficiently spacious to be laid out as boulevards with trees and grass, a pleasant promenade and a breathing space through the whole district. The secondary roads should have sufficient width between front and front of house to allow of large front gardens, so that if any widening of the road should be hereafter required for tramway or other purposes it can be effected without destruction of buildings and the payment of heavy compensation, the Corporation having then only to pay for taking part of the gardens. The less important roads should have a greater width between house and house than is now required; the carriage road need not be so wide, but sufficient only for two vehicles, the spare width being grass margin with trees or front gardens; this would be less costly than the present 40-foot road, equally useful and much more pleasant. The extra cost of a boulevard through a large estate would be compensated for by the increased value of the estate, especially of the frontages to the boulevard, and would also be compensated for by the less costly, less important roads. The plan of roads should be laid down to the best advantage of the town and suburb, and might not be the best for any particular estate, in which event compensation for injury should be paid or the local authority should have power to purchase by arbitration.

The number of houses to an acre should be limited to some parts of the town more than in others; any action whatever might, however, have the effect of the ground rent, but the experience in Germany is to the contrary; it is said that the amount of ground rent for any house can be charged with has already reached the utmost limit, and that the ground rent for the larger plot would remain the same as for the smaller. This, however, not being so serious a loss of profit to the owners as might be supposed, the cost of road-making is necessarily being more for the larger plot than for the smaller; and, being let in larger plots, the estate is developed more rapidly and the owner would sooner realise his profit. To let an estate in plots three times the size of those on another estate, the first would be developed in a third of the time. The letting value for building would also in all cases be above agricultural value, and the loss of profit really represents some of the unearned increment. How far local authorities should have power to limit the number of houses becomes, therefore, a question as to whether provision for the more rapid housing of the people will justify Parliament in giving powers which will limit the realisation of some of the unearned increment—that is, of some of the difference between agricultural and building value—always remembering that the unearned increment is due to the efforts of the town and not to the efforts of the landowner.

The local authority should have power to purchase land necessary for the development of any proposed scheme of town planning, but it is a very serious question as to whether or not the authority should have power to purchase merely with a view to securing the unearned increment. Land is so very slow in developing, and, if purchased at a value above agricultural or accommodation value, then the owner will not pay the interest on capital, and will not provide the sinking fund required by the Local Government. The difference would have to come out of the rate year, and it is possible that the natural yearly increase in value of the land might not be sufficient to cover the interest on the rates, in which case there would be a permanent annual loss. Besides which, experience teaches that local authorities seldom or never acquire property at a value; there is always 10 per cent. added for commission on purchase, and the tendency of arbitration is nearly always to favour the party who is compelled to sell.

Power to purchase, however, should be granted on limited conditions, and power to deal with the question of "town planning" should be granted with the least possible delay, as every month we see our towns becoming more and more overcrowded, and laid out in a way which will some day cost the town very many thousands to rectify.

## VENTILATED FIRE LOBBIES.

THE Building Act committee of the London County Council report that since the coming into operation of the London Building Acts (Amendment) Act, 1900, there have been made to the Tribunal of Appeal against the Council's requirements for the provision of ventilated fire lobbies to staircases in the undermentioned cases:—15 Leather Lane, 1 and 2 Gracechurch Street, 42 Beech Street. In the Gracechurch Street case the erection of the building was commenced before the Council had been approved by the Council. The owner appealed against the Council's requirement for the provision of lobbies on the remaining floor. The Tribunal only allowed the appeal, but gave the appellant power to provide the staircase without the lobbies he appealed against to provide.

The decisions of the Tribunal of Appeal in the above cases have made it necessary for the committee to reconsider the practice of the Council in similar cases arising under sections 7 and 9 of the Act. Hitherto it has been the practice to require, as an alternative to secondary escape, ventilated lobbies to staircases in order to prevent smoke logging. The Tribunal of Appeal has declined to lay down a general rule, but in the three mentioned cases it has decided that an enclosure resisting or incombustible staircase with means of escape to and from the roof is sufficient for the purpose of the Act. The committee have, therefore, determined that in similar cases such means of escape only shall be required.

## MANCHESTER ART GALLERIES.

Annual report of the Manchester Art Gallery committee states that the public show increasing interest in collection of pictures and other works of art, 848,878 having passed the turnstiles in the central gallery in the twelve months of 1906-7. At the exhibition in 1906, that which lasted from September 18, 1906, to January 10, 1907, the number of free admissions was 116,816. From December 3, 1906, up to January 27, 1907, exhibition of the works of William Holman Hunt and of free admissions was 36,226. From March 25 to May 17, 1907, at the Frederic Shields exhibition, the number of free admissions was 47,788.

On May 4, 1906, the Council approved of the transfer of the Queen's Park Museum and certain portions of the Heaton Hall for art gallery purposes. This was an important departure in the work of the committee, who through branch art galleries much can be done to increase the scope and public usefulness of their operations, particularly to bring within easy reach of citizens in the localities good examples of art. At the Queen's Park Museum an exhibition of oil-paintings, early English water-colour drawings, and of a collection of "old" pictures has been held in the gallery. The number of free admissions from September 17, 1906, up to September 16, 1907, was 143,239. At the Heaton Park Museum an exhibition of oil-paintings and water-colour drawings by members and associates of the Manchester Art Gallery of Fine Arts, a collection of Early English furniture, a collection of works illustrative of "Old Manchester and Salford," is being held in the gallery. The number of free admissions from May 20 to September 29 of 1907 was 102,896.

In addition to the collections include "Napoleon at Waterloo (or a lesson in humanity), oil-painting, by J. Barker, bequeathed by Mr. Robert Leake; "The Peepfold," oil-painting, by William Charles Estall, bequeathed by Mr. John Arthur Bland; and "Portrait of the Mother," oil-painting, by Henry Measham, presented by Mr. Richard Redfern.

## AN EDINBURGH SUBURB.

It is hard to imagine a native of Edinburgh, who had been absent little more than twenty-five years from the city, on revisiting the suburb of Morningside, he would not be surprised to find the *Scotsman*, but few of the older landmarks in the neighbourhood. The low cottages which lined the right and left of the Burn, with a few exceptions, are swept away and have given place to high tenements, with a wide road of busy tramway between, and a much too wide roadway and pavements for such an important thoroughfare. A jumble of houses meets the eye of the visitor to the right and left, filling up the sides and bottom of the ascending and rising ground, sweeping up to the top of the Braid Burn, and even wandering out beyond the old and new Biggar roads. The old school and the main in Morningside Road, but the gate-posts of the old gate adorn another gateway in the Corstorphine Road. The hammer of the destroyer is now busy with the old itself, the grounds around which might have been a admirable public park for the district. The brand new property, with St. Peter's Roman Catholic church on one side of Falcon Avenue. There are many churches southward in the Morningside Road, one public and two private schools, a branch of the free library, hotel, cemetery and railway station. The high wall and prison-like gateway to the Morningside Asylum, has given way to high tenements; Canaan Lane is also graced with some tenement property which has edged its way amongst the cosy, comfortable urban residences, to come to which from Edinburgh to mean a most delightful rural walk and change of scene. One of these cottages came Sydney Dobell, the architect of health and quiet; while the funeral of the artist, Michael Kemp, architect of the Scott Monument, was held in the Cottage, Jordan Lane, which is still standing, surrounded by tenements. Stories of that Bohemian life in the Bough, still linger around his cottage in Jordan Lane. It is an old story how the tollhouse (in line with the wall of Braid U.F. church) was removed and rebuilt in stone, as it had stood, at the entrance gate to the

Hermitage of Braid, of which it now forms the lodge. A new asylum for the insane has been built at old Craighouse, once occupied by Dr. Lizars, and later by John Hill Burton, who did much of his literary work there. There is Craiglockhart poorhouse and the new fever hospital to the south-west. Villas, semi-detached villas and tenement property jostle one another on the east side of Craighouse Hill to the right. To the left the care and surveillance exercised by the trustees of the Braid estate have kept the speculative builder in his place, and preserved the amenity of this really fine district built on the fields around what was Egypt farm, which stood just where Nile Grove intersects Woodburn Terrace. So rapidly has the ground been covered with villas and semi-detached villa property within twenty-five years that little more than twenty acres remain to be seen on the Edinburgh side of Braid Burn.

The literary and artistic associations of Morningside have included the residence of John Hill Burton at Old Craighouse, as we have said. Sir John Skelton lived and wrote and died at Hermitage of Braid. R. L. Stevenson wandered to and from Swanston by the footpath past Comiston farm, and with the downdroop of his head and careless attire was thought by native or passer-by "to be no a' there." James Wilson, brother of "Christopher North," lived at Woodville, Canaan Lane. Sir John Skelton has left memorials of some of the noted people, such as J. A. Froude, Blackie, Jowett, Huxley, Professor Sellar, Sir Noel Paton and others who visited the Hermitage.

Dr. Chalmers built his substantial square villa at Churchill the year before the Disruption, and after that event the faithful members of the Free Church here gathered in a tent before the first Free Church was erected. This tent was pitched near what is the south end of Abbotsford Park, and one Sunday between services was overturned in a gale. Dr. Chalmers invited the congregation to his house at Churchill, and the officiating minister preached the sermon to those assembled from the top of the staircase.

Here we must end. A multitude of other remembrances will arise in the minds of those who can go back in memory some thirty or forty years ago. Volunteers practised shooting at the targets from the slope of the Braid estate towards Blackford Hill. The green fields of South Morningside, owing to what Stevenson calls the "infuriated zeal of builders," are a thing of the past. He wrote:—"Day by day, one new villa, one new object of offence, is added to another; all around Newington and Morningside the dismallest structures keep springing up like mushrooms; the pleasant hills are loaded with them." Stevenson became an exile at the beginning of this building boom and did not see the end. Some philanthropist might have it in his power for 30,000*l.* or 40,000*l.* to add the Hermitage of Braid, with its banks clothed with valuable timber, to the Braids and Blackford as an extension of our public parks. This would add to the amenity of what, in spite of the sins of omission and commission of builders and others, is one of our pleasantest and healthiest of Edinburgh suburbs.

## Eagle Eyes and How to get Work.

SIR,—On reading an effusion in *The Architect* for October 25, 1907, the office boy perpetrated the enclosed.

—Yours faithfully,

ROBERT WILLIAMS.

Alexandria: November 5, 1907.

Enclosure.

THE PANTALOO.

The lean and eagle-eyed one,  
Did write and blushed to find it fame—  
Did write, and rushed to hide his name,  
But lost his slippers in the run.

But worse.—His Fate her wand did wave,  
And, papilio-like, he changed—  
Was changed—into a pantaloon,  
A 'loon of aspect lean and grave.

THE OFFICE BOY.

Three Churches are about to be erected in Bolton in the districts of St. Barnabas, St. Philip, and St. Margaret. Information can be given by the Rev. J. F. Heyes, M.A.

## GENERAL.

The Royal Academy give notice that the President and Council will elect, on December 17, a Turner annuitant. Applicants for the annuity, which is of the value of 50*l.* must be artists of repute in need of aid through the unavoidable failure of professional employment or other causes. Forms of application can be obtained from the secretary, Royal Academy of Arts, Piccadilly, W. They must be filled in and returned on or before December 10.

Mr. Arthur Bernard Cook, M.A., Fellow and Lecturer of Queens' College, was on Tuesday appointed University Reader, Cambridge, in Classical Archaeology. Mr. Cook graduated at Trinity College. The stipend is 300*l.* a year.

Mr. Robert Young, architect, of Belfast, is one of the gentlemen selected for knighthood on the occasion of the King's birthday. He erected several buildings in Belfast, and has rendered many services to the city in which he was born in 1822.

The Rawtenstall Town Council have decided to deal during the present municipal year with the construction of an electricity generating station, the electrification of the tramways and the running of motor buses. The cost is estimated at—Parliamentary Bill, 4,000*l.*; electricity station and cables, 34,000*l.*; purchase of tramways and conversion, 100,000*l.*; motor-omnibuses, 2,000*l.*; total, 140,000*l.*

Mr. Lewis F. Day is to deliver a lecture on "How to make the most of a Museum" before the applied art section of the Society of Arts on December 17. Sir Aston Webb, R.A., will preside.

The Northern Architectural Association held their first ordinary meeting of the session on Wednesday, when Mr. A. B. Plummer, J.P., president, delivered his opening address.

Alderman Lieut.-Col. Lacey W. Ridge, V.D., has been elected mayor of Holborn. He was elected a councillor on the formation of the Metropolitan Borough Councils in 1900, and an alderman last year.

The Alterations and additions at the North Berwick parish church have been completed, these comprising the erection of a tower 90 feet high and a central entrance door. The cost of the alterations has been about 3,000*l.* The architects were Messrs. Henry & M'Lennan, Edinburgh. Above the new door of the church is a figure of St. Andrew by Mr. W. Birnie Rhind, A.R.S.A. The bell from the old church has been repaired and hung in the new tower. An inscription on the bell reads as follows:—"Jacobus Monteith me fecit Edinb(rough) pro templot de North Berick. Anno domini 1642. Spero meliora." The Town Council are providing a clock for the tower from the common good fund at a cost not exceeding 150*l.*

During the course of excavations at the east end of Selby Market Place and in proximity to the gate of Selby Abbey, workmen have come across the remains of the foundations of the abbey gateway and have unearthed them. In addition portions of a brick floor have been disturbed only a few inches from the surface.

Mr. M. R. Cotes, who was mayor of Bournemouth in 1894, has decided to give his residence and the large collection of pictures and works of art which it contains to the town of Bournemouth, for the enjoyment of the townspeople and visitors, the only condition being that he and Mrs. Cotes should be allowed to occupy it during their life. The house is known as East Cliff Hall, and with the contents, it is valued at about 40,000*l.*

M. Jean Deville, the Belgian painter, who was for some years professor in the life classes of the Glasgow School of Art, has been commissioned by the Minister of the Fine Arts of Belgium to decorate the Assize Court of the Palace of Justice, Brussels. M. Deville is to execute five panels, the largest of which, to be placed above the principal entrance of the Court, measures 36 feet by 15 feet. The subjects chosen are symbolic of the acts of justice and the law, and the execution of the work is expected to occupy the artist about seven years.

A Memorial is to be erected over the grave of Dr. Barnardo in his model village of Buckingside, Essex. The work has been entrusted to Mr. George Frampton, R.A. The memorial is to be 15 feet in height. On the summit of the stone pedestal will be a bronze group of three figures—a mother and children. A portrait medallion of Dr. Barnardo will be at the side; and at the base three children will be seated, one of whom is to be represented as telling to his comrades the story of Dr. Barnardo's life-work.

Sir William Richmond, R.A., will give an account of his method of mural painting to the members of the Incorporated Institute of British Decorators at Pain Little Trinity Lane, on the 25th inst.

A Branch has been formed in Edinburgh of the School of Archaeology in Egypt, whose headquarters are in London. Professor Flinders Petrie is the president.

Messrs. Clinton & Russell, architects, New York, are completing plans for doubling the capacity of the City of Astor, on Times Square, New York. The addition will be 3,000,000 dollars. It will extend back 100 feet from Fourth and Forty-fifth Streets. The enlarged street will be 200 by 260 feet.

At a Special Meeting of the Wolverhampton Council, in answer to a letter with reference to unemployed people upon the new reservoir, Alderman Marston said it was hoped to bring the new reservoir before the next meeting of the committee early in December. The committee propose to do the work themselves, as it was undesirable, but it was intended to put a clause in the contract that all available and suitable labour in the district should be employed. A motion that the standing committee be suspended in order that the matter be discussed was carried.

A Meeting of the health committee of the Bournemouth City Council was informed on Tuesday that the Government Board had given their official sanction to the application of the Corporation for permission to raise 17,000*l.* for the purchase of the Salterley Grange, near Cheltenham. The money is to be repaid in 10 years. The object of the Corporation in acquiring the estate is to erect a sanatorium for the treatment of consumptives.

Mr. H. W. Taylor, civil engineer, of Birmingham, Newcastle, on the 12th inst., in the court of Mr. Justice Pollock, official referee, sued the Dolgelly Rural Sanitary Board to recover 110*l.* fees in connection with waterworks he had carried out for them. The Board admitted this claim, but counterclaimed against Mr. Taylor for 113*l.*, the price of certain work which had been done by him at the villages in their district, and which he claimed beyond his authority to order. Mr. Taylor contended that this work had been ordered by the parish council, and that the Dolgelly Sanitary Board had no place concerned, and that the Dolgelly Council had no authority to order their action. Mr. Pollock, having reviewed all the evidence, said he came to the conclusion that there was no ratification of the work done by the Dolgelly Council, and that therefore their claim against Mr. Taylor entitled him to his fees.

The Sites Syndicate, Cambridge University, are under consideration the most suitable position for a proposed building for the School of Agriculture, and have recommended the Downing site to the south of the Botanical Garden. The building would be near the departments of geology, and would have access from three different directions and would be well lighted. They have already consulted Sir Aston Webb, R.A., on the subject of laying out the whole of the Downing grounds, and they are of opinion that it is important that the buildings on this site should be entrusted to one architect. They suggest that the distances of the proposed agricultural buildings already erected should be determined by the committee in conference with the architect who may be entrusted with the design of the building.

A Conference of representatives of sanitary authorities will be held in the Council Chamber, Caxton Hall, London, at 11 A.M. to-day, the 15th inst., for the purpose of considering the question of the establishment of a national health authority. A resolution will be passed approving of the establishment of a union which shall have for its objects:—(a) To secure, as far as possible, a harmonious, harmony of interest and uniformity of action of sanitary authorities in general on matters relating to public health; (b) to stimulate and concentrate the efforts of sanitary authorities for the purpose of effecting necessary sanitary reform for the public weal or the benefit of individual districts; (c) to encourage and promote the study of hygiene, and to educate opinion with respect to the importance of public health in general; and (d) to consider the different circumstances, general or local, whereby disease may be caused to man and, as far as may be, to remove it.

## THE WEEK.

Annual festival dinner of the Builders' Benevolent Institution will be held in the Whitehall Rooms, Whitehall, on the 28th inst. Mr. FREDERICK HIGGS is the chairman for the year 1907-8, and he has earnestly appealed for financial support in order to carry on the work of the charity without further encroachment upon the reserve fund. To achieve this £50,000 is required, of which but £49,000 is assured by subscriptions, leaving £1,485 to be gathered by donations and new or increased subscriptions. Mr. HIGGS accordingly solicits an increase in the number of subscribers or donors. The Institution is open to all necessitous members of the London Building Trade and its various branches who have been widowed or disabled, and to their widows. Last year the expenditure was £2,714 18s. 4d. To meet that sum it was necessary to withdraw from capital £506 12s. 1d. It is therefore evident that increased support is needed. Mr. HIGGS suggests that the subscribers will, if, to meet the emergency, they doubled their gifts.

Action in favour of centralisation was taken at the meeting of sanitary committees of the country which was held in Caxton Hall, Westminster, on Friday last. There are, as is well known, efforts in progress, and each is in a manner which is most suitable under local conditions.

But according to some of the men who are in the force is dissipated through the absence of unity in the operations. The objects of the movement were stated by us last week. In the course of the discussion upon the resolution it became evident that such as the proposed organisation could not do more than to confer power and must confine itself to offering suggestions. The usefulness of the union could not fail to be apparent.

An amendment was proposed suggesting the establishment "of a special department of the Local Government Board to deal with all questions of public health, upon which representatives of the various local authorities shall be appointed; and by this resolution be sent to the various committees, with a request that they will unite in a Local Government Board to constitute a committee for this purpose." But a majority of those present were in favour of the original proposals. A resolution was therefore appointed inviting authorities to join the National Union of Public Health Authorities.

Experiment of the London County Council in making bricks has not been financially successful. When they acquired the brickfield at Norbury in 1901 one of the conditions of purchase was that which had been used by the vendor for the bricks should be purchased. The Council then made the bricks to be used in the cottages on the estate, and the work has been carried almost to the present time. Including the cost of the bricks there was a deficiency of £2,983 15s. 11d. up to the 1st of March of the present year. It is claimed that the conversion of the surplus clay into bricks and the saving effected by a considerable saving in the cost of digging clay and carting it from the site at Norbury would not have been less than £35 6d. a year.

About 20,505 cubic yards of clay have been used in the manufacture of bricks and burnt bricks. The value of the stock of bricks, &c., on the 1st of March, 1907, was £16,701 11s. 9d. Operations on a

large scale were suspended in last January. Up to the 1st of October this year 254,000 red bricks have been made at a cost of 497½d., and 567½d. was expended on burning ballast. The committee do not ask for authority to resume brickmaking, but they wish to be allowed to expend 150d. on the manufacture of concrete blocks and slabs, which will be required for use in the construction of retaining walls and the internal walls of the cottages.

EXAMPLES have been found in Egypt of tombs resembling the so-called Treasury at Mycenæ which were not constructed of regular masonry, but hewn out of the rock. Dr. ARTHUR EVANS has discovered a similar chamber beneath the southern porch of the Palace of MINOS at Knossos. A shaft was sunk by him to a depth of 25 feet without reaching the floor. He was compelled to suspend operations owing to the want of money. The find, however, is of importance as suggesting that beehive construction was in favour at an earlier period than the Mycenaean in Greece. Dr. EVANS appeals for funds to continue his explorations in Crete. His success warrants the conclusion that he has hit upon fertile ground in an archaeological sense. The Palace of MINOS has enabled students to distinguish between romance and reality, and to value the extent of the bases for several of the classic legends and myths. If a Frenchman or a German had been equally successful public funds would be drawn upon to carry out the exploration. But England has left Dr. EVANS to endure sacrifices which, although they may be evidence of his enthusiasm and skill, are not creditable to the public spirit of Great Britain.

THE Commercial Attaché at Peking, like officials of the same class in other parts of the world, points out the necessity for expert agents in China. There is no doubt that numerous factories are about to be set up, but the Chinese have only vague ideas of their cost and what is necessary for their equipment. If British manufacturers were to combine and send out a staff who would be competent to give technical information, prepare plans, estimates, &c., there seems to be little doubt about the result. The Germans have established a few houses of the kind in Shanghai. There are also a number of firms holding the agencies of British manufacturers, but far more than this is required. Firms in China have many diverse interests to attend to, and they are unable to push the manufacturers' business as it might be done by means of special expert representatives. It is also remarked by the Commercial Attaché that Chinese merchants are becoming more eager to pass over middlemen and to trade directly with the manufacturers, and in that way to save commission.

WHEN the underground railway in Paris was projected, failure was anticipated on the ground that the inhabitants of the city were so accustomed to travelling in the open air it had become essential, and no substitute would be accepted. A recent discussion in the Municipal Council suggests the change in disposition. Several of the owners of large general shops had presented petitions to be allowed to make subways to the nearest railway stations. The proposal was not considered on its merits as a means to relieve the traffic in the principal thoroughfares. The objection to it was based on the supposition that an unfair advantage would be derived by certain traders and that others must suffer. The petitions were therefore rejected. It is evident that a large number of people would patronise the subways, for otherwise the outlay on construction would not be repaid.

## THE PALAZZO STROZZI, FLORENCE.

THE visitor to Florence, although he may not be a student of architecture, is sure to have pointed out to him the gloomy Palazzo Strozzi, for it stands apart in the Via Turnabuoni. Architecturally it is probably the most characteristic of the Florentine palaces, and recalls a time when it was essential for the residence of a noble to be capable of withstanding a sudden attack or a siege. It bears some resemblance to the earlier palace of the MEDICI, but would be more difficult to break into. The MEDICI had many enemies in Florence, but they held the highest authority in the city. The STROZZI could never be assured of the friendship of the MEDICI, or that they might not encourage an insurrection against them.

It could not be denied that the rivalry between the two families either directly or indirectly led to many disturbances. Sometimes they were allied, while at other times they were bitter opponents. In 1435 PALLA STROZZI was exiled; he retired to Padua and devoted himself to the new learning. He had before brought CHRYSOLORAS from Greece to Florence as professor of Greek. Afterwards, in order to obtain manuscripts, he undertook a voyage to Greece. He had arranged to form a public library at Santa Trinita, which is at one end of the Via Turnabuoni, and had engaged copyists, when he was prevented by the defeat of his party. In his exile at Padua he engaged another Greek to be his tutor; he died in that city in his ninetieth year.

His son FILIPPO in 1466 obtained permission to return to Florence. He found on his arrival that his uncle had commenced an immense palace of which the plans had been submitted to LORENZO DE' MEDICI. It was intended to serve as a memorial of the family. The model of the building was prepared by BENEDETTO, a brother of GIULIANO DA MAJANO, who was originally a joiner and wood-carver, but, like so many craftsmen of the time, studied architecture. BENEDETTO was a worker in tarsia, but he likewise was acquainted with architecture. Under him the foundations and lower storey of the new palace were constructed. But as he had to help his brother in contracts undertaken in other parts of Italy, the completion of the palace was entrusted to SIMONE, better known as IL CRONACA, or the chronicler, on account of the knowledge he possessed of antiquity and of surviving remains. The upper part of the building and the famous cornice are credited to him. The cornice, it is said, was intended to be carried all round the palace, but the building does not confirm that tradition. It is complete only on the principal façade and partly on the returns. VASARI says that it was copied by CRONACA from an antique example at Spogliacristo, or, in other words, from one of the ruins of Rome. The original was apparently of smaller size. At the time reproductions of the kind must have been common, for VASARI did not hesitate to praise CRONACA as if he were an example for all architects to follow. "Thus did the genius of CRONACA," he says, "enable him to avail himself of the works of others, and even to make them become almost as his own, a thing which few succeed in accomplishing; for the difficulty does not consist in merely becoming possessed of drawings and copies from fine works, but in knowing how to use them in such sort that they shall be in harmony with that to which they are applied, and shall conduce to the beauty, grace and convenience of the whole, in due measure and proportion." When, however, another architect introduced a cornice from a Roman building, we learn that the experiment was censured and vituperated by the Florentines, because the crowning ornament was supposed to be too large for the façade.

The cornice of the Strozzi Palace was executed with great care, and the remainder of the masonry was, according to VASARI, so closely set as to appear one piece. But this is more true of the vertical joints than of the horizontal, for the rustication, of which BENEDETTO

determined the character, is remarkable for as well as the length of the lines between. CRONACA designed all the details and ornamenting the torch-holders which have been in some modern books on metalwork, and whose delicacy, are a strange contrast to the massiveness of the smith employed was NICCOLO GROSSO, who was an oddity. He was known as CAPARRA, for he took part payment before he commenced his work. The first it was observed that the interior exactly correspond with the exterior. But it was given was that CRONACA had to accommodate himself to MAJANO's planning. VASARI in that way accounts for the steepness and suddenness of the staircase and the plainness of the chambers.

IL CRONACA was one of the numerous architects who were fascinated by the discourses of S. VASARI says that his head was so filled with the discourses of the Dominican, he could think of nothing else. But to acquire that knowledge it was necessary to go to BURLAMACCHI, who was a votary of midnight and wait in the cold outside the cathedral until it was opened. Within the cathedral there were no seats, and the people had to stand on the marble pavement for hours. CRONACA was observed among the crowd SANDRO BOTTAI, DELLA ROBBIA family, BACCIO DE LA PORTA, MONTE LUPO and LORENZO DI CREDI, better known as painters and sculptors. He must also have been present at the scene in the Piazza di Signori when, under the direction of many works of art and monuments were destroyed, with gaming-tables and things which helped to amuse the Florentines. At the same spot a few months afterwards SAVOIR-VIVRE was the victim. IL CRONACA died about 1500, and was buried in the church of San Ambrogio. His work was written by one of the STROZZI.

That family had a gloomy time before the palace was suggested by DE MUSSET's "Lorenzaccio," scenes of which are supposed to be enacted in the palace. FILIPPO, who was the heir of the family, erected the building, had, like his predecessor, to play a somewhat ambiguous part. His influence was immense, and he had taken the precaution to place a large part of it in foreign banks. He was married to a daughter of PIERRO DE' MEDICI, and yet he was supposed to be one of the enemies of the rule. In 1527 he was enabled to have the Republic rarely restored, when the MEDICI became citizens. But two years afterwards, the influence of the Pope and CHARLES V., against Florence and the MEDICI were directed. FILIPPO again appeared to support his rivals, but at the same time he endeavoured to have ALESSANDRO removed. After the battle of Ravenna in 1537 FILIPPO was taken prisoner; he was tortured and finally committed suicide to escape execution. History forms what is the strangest chapter in the career of Florence. His son PIERRO fled to France, became a marshal in the army and was renowned as a warrior. He endeavoured to take revenge on the Florentines, but was defeated. He afterwards fought against the Spaniards. Other members of the family held prominent positions in Italy and a love of power continued to be a characteristic of the major branch.

It might be said there is a fatality about the great Florentine families. The Medici sold in 1659, and since then bears the name of the chasers, the RICCARDI. The great Pitti Palace was supposed to be large enough to contain the building in one of its courts, was sold to the Grand Duke and subsequently became the palace of the Grand Duke and finally a public gallery. The Strozzi continued to belong to representatives of the family, although not in a direct line. According to the will of the last owner it is to become with the contents one of the possessions of the city of Florence. Unfortunately it is not rich in works of art.

all that was valuable among them was sold Russian Government. But the palace, which ELYN described as "a princely piece of architecture in a rustic manner," is a treasure in itself. For, considered, it is the most characteristic of the palaces. It was intended to endure and passed many revolutions without any damage. No one can look at it without becoming convinced that only extraordinary force can overcome such masonry, which might have been wrought and finished by Etruscan hands.

### SHOP FRONTS.\*

picturesqueness of the old London shops was the result of necessity rather than of any love of art. The width of a frontage was determined by the business of the shopkeeper, and it was the business of the shopkeeper to get the most of it. The area of his windows depended on the glass which could be obtained, and it was necessary in order to support the upper parts of the building above the openings to have substantial masonry for the same reason a wall of brick or masonry was employed under the windows. The vacant space between the windows was therefore limited. The introduction of iron girders, and subsequently of girders of iron or steel, and the immense plates of glass which could be procured caused a revolution.

It should be remembered that for a long time shopkeepers had been desiring to display their goods to the public. That could only be done to a limited extent in the ancient shops of London; and what was true of the Metropolis was still more true of provincial towns. Although after the Great Fire efforts were made to perpetuate prior arrangements, yet, owing to the influence of French customs, a fashion arose to have the magasins of Paris rather than the old London shops. This is evident from the remonstrances of DEFOE. According to him there was no proof of the degeneracy of the age in which he lived. The novel shops which were being constructed, for he considered they were only appeals to vanity. Handsome shops were, he said, a mimicry of the French, who were eminent for thinking too much of the things. The new type of shop he compared to the dress of puppets and rope-dancers; it was the work of an Englishman and dangerous to tradesmen. DEFOE declared it was a scandal to find a man engaged in business expending a third of his income on painting, gilding, wainscoting and glazing. He insisted on prompt payment, and complained of the merchants who supplied the goods to the shop who were compelled to wait. It would be far better, he said, to furnish the shop with goods which were ready to lay out the capital on painting, gilding and glazing. "Never," he exclaimed, "was such painting and gilding, such sashings and looking-glasses seen in shops of shopkeepers as there is now, and yet trade was more in former times by a great deal than it is now. If we may believe the report of very honest and standing men." DEFOE considered it was a waste of money to use panes of glass measuring 16 inches square, and a scientific arrangement of windows that by side-lights, sky-lights and trunk-lights might be seen advantageously, he regarded as wasteful and almost as bad as "washing over a shop to make it pass for sterling."

Of all that could be said by censors who lived in good old times, the traders of London complained that they had to make their windows become auxiliaries to the business. The conditions under which property was held helped to perpetuate a system which was not

advantageous to shopkeepers. But whenever new streets were formed there was an endeavour to impart an importance to the window which, if judged by architectural rules, it did not merit. Thus when the new approach to London Bridge was opened out, critics of the old school objected to the introduction of immense windows, which extended from the stall-board to the cornice under the first-floor windows, the sash-bars being so painted as not to be obtrusive. The endeavour of the builders was to anticipate a time when plates of glass would be so vast that one of them would be sufficient to fill the area assigned to a window.

In criticising windows it is not always asked whether they are intended to aid in attracting spectators or mainly to light an interior. Some picturesque examples which are introduced in Messrs. DAN and WILLMOTT'S volume were never intended for the display of goods. One in Long Acre is an undertaker's. Another and better-known example is a dignified grocer's in Oxford Street. But a crowd is never seen outside the windows between the Corinthian pilasters. When a house has gained a reputation like LAW'S or BELL'S, the front windows are not of much account. But adventurers believe they dare not appear as if they were indifferent to the patronage of the public. In the plates of the new volume there are a great many examples which will suggest the variety of efforts made to meet the desire for display without too much of a sacrifice of architectural principle. In an artist's warehouse in Holborn the passer-by can see examples of all the kinds of goods to be sold without entering the shop. Even when the shop is closed the variety is suggested. A similar plan is adopted in the dépôt of the Tract Society. An old-fashioned shopkeeper would object to such a sacrifice of valuable space. But we suppose more customers are attracted than if every inch of the recess was thrown into the shop. Very ingenious arrangements are also to be seen in utilising the narrow fronts of dwelling-houses in the West-End of London for business purposes. In such places old-world types somehow seem suitable.

The examples are not confined to London. Shops in Edinburgh, Glasgow, Manchester, Liverpool, York, Bournemouth and one or two from Paris and Brussels are also utilised. An example of a co-operative store in Edinburgh suggests the question why in provincial towns such societies have to keep pace with the times and to erect showy buildings, while in London similar attempts are avoided? In London we suppose there is a sufficiently large class connection to support stores, even if they were found in corrugated iron buildings, while in the provinces the societies are compelled to depend on outside support. Formerly shopkeepers occupied the rooms over new shops, and there was a chance of the building having more or less unity. In our time it is common to let the cavernous space as a separate tenement, and leave the tenant to make his own arrangements about the adaptation of it as a shop. In other cases the tenant is allowed to transform the existing shop to suit his purposes. In consequence numerous examples are now to be found in the streets of London, where the lower part of the building is out of keeping with the upper, and the shop asserts its supremacy. But under the new conditions of business and the "conversion" of houses it is doubtful whether any other course is possible. The architect who designs a shop must in such a case become indifferent to the contrast which arises when he eclipses the older work.

There is another point which has to be considered. In modern work an effort is often made to express purpose. This can frequently be done in designing shops. Unfortunately traders who hold them are not always successful, and a shop may in consequence be used for a variety of trades in succession. If the history were recorded in any way it would not be serviceable to the new occupants. It is therefore noteworthy how few of the latest examples shown in Messrs. DAN and WILLMOTT'S book suggest a connection

\* *Shop Fronts, Old and New.* A Series of Examples of Shop Fronts. Architects. Selected and specially Photographed, with Descriptive Notes and Illustrations. By Horace Dan, and E. C. Morgan Willmott, A.R.I.B.A. (London: E. C. Morgan Willmott, A.R.I.B.A.)

with any class of business. The admired example of a carpet merchant's in Holborn could be used for another business if the camels with their bales and the eastern workmen were taken away. A poulterer's and fishmonger's premises in York could be turned into a shop or shops of a different kind by removal of the panels which represent poultry and fish. A café in Manchester and another in Liverpool are only partially suggestive of the East. But in most of the examples, as we have said, the business for which they are designed is not manifest. When we see a series of such fine windows as those of Messrs. DEBENHAM in Wigmore Street, it is of course at once recognised that specialists in window-dressing are employed, and that a large stage must be provided for their dispositions. Only in businesses where goods are displayed as if they were puppets in a show is such skill needed, and the inference can be drawn at the first glance.

The selection of subjects has been left to Mr. DAN; the descriptions which form a treatise have been written by Mr. WILLMOTT. He treats the subjects under the following heads:—The recessed shop front, the type shop front or type adopted for their various establishments by a particular firm or company, the projecting shop front, the corner shop, the double-storeyed shop front and the shop front in series. The subsequent part deals with the practical requirements of the modern shop front as follows:—Materials, glazing, lettering, lighting, construction, stall-boards and pavement lights, sun-blinds and roller-shutters, entrances, &c. In nearly every case the shop illustrated is the work of an architect. That suggests the difference between past and present. English architects like those on the Continent are not unwilling now to accept a commission for shops alone. For those who have not given much attention to the subject the information offered by Messrs. DAN and WILLMOTT may enable them to overcome difficulties, for the arrangements of a perfect shop are more complicated than is commonly supposed.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Mr. ALEXANDER GRAHAM (hon. sec.) announced the decease of George Rackstrow Crickmay, elected Fellow 1884, and Emile Trélat, director of the Ecole Spéciale d'Architecture, Paris, and an hon. corresponding member of the Institute since 1884.

Mr. MERVYN MACARTNEY read a paper, illustrated by lantern views and diagrams, on

##### The Present Condition of St. Paul's Cathedral.

In opening his subject Mr. Macartney said that the occasions on which he might becomingly break the silence which, as Surveyor to the fabric of St. Paul's, he had to maintain were few; a gathering of architects, meeting under the auspices of the Institute, was indeed the only exception he could make. Dealing at some length with the report recently published of the committee of architects appointed by the Dean and Chapter, Mr. Macartney referred to the circumstances under which the committee came to be appointed, and read passages from the committee's interim report, pointing out the danger which would threaten the cathedral if the London County Council sewer were constructed in such near proximity to it, and urging the adoption of another route in order to guard the building from all possible risk. The author then gave a brief survey of the conditions under which the cathedral was built, and referred to various repairs carried out during the eighteenth century. From the date of the completion of the shell of the building there was no evidence of any anxiety for the building's safety for over a century. The first note of alarm was sounded in 1831, when a sewer was schemed to go round the south side of the church from Ludgate Hill to Cannon Street. Mr. Cockerell, the cathedral surveyor, drew the attention of the authorities to the danger, and, together with Messrs. Robert Smirke and George Rennie, drafted a report giving their opinion that the fabric would be endangered if the

sewer were constructed in the churchyard, a mending a new line for the sewage. The author sent some interesting letters on the subject which were written at that time between Messrs. Cockerell, Rennie and The result was that the Commissioners of Sewers consented to divert the sewer along Carter Lane. The next note of alarm was heard in 1890, when the London Railway Bill was before Parliament. It was proposed to run a tunnel the length of Newgate Street of more than 70 feet below the floor of the cathedral. Penrose, in November 1890, reported that a tunnel placed would drain off the water from the low level of the gravel and sand which underlie the foundations of the cathedral, and so cause them, to some extent, to settle, and there and risk serious injury to the structure. This proposal passed a committee of the House of Commons, but was thrown out by a committee of the Lords on the ground that it was the Dean and Chapter.

Coming to the present condition of the cathedral, the main points of weakness in the cathedral—the dome, the piers, and the portico—is to say, which have shown, and on the slightest movement will show again, signs of settlement and movement. The dome, the south transept, and the western portico.

The settlement of the dome, which had large dimensions during the progress of the building, shows that the care with which Wren spread the weight, that the great mass has sunk and is now severed from the surrounding masses. The dome is carried on eight piers about thirty feet long; those at the crypt are with the bastion-like masses at the angles of the transept, nave and choir by long barred vaults: these arches have cracked through. The weight of the superstructure rests much more on the inner ends of these eight piers on the outer ends, and the sinking of these piers causes movements overhead. Moreover these great piers have sunk equally, those on the south side connecting the south transept being lower than the others; and the westernmost has descended bodily over six inches. This may be seen in a striking degree in the columns supporting the drum of the dome. These columns are in the outer ends of a series of arches set at right angles to the base of the cone. The arches and the columns above them are all more or less cracked, and the dome is practically severed from that part of the arch on the dome. The dislocation is sometimes visible. This downward tendency of the central mass of the dome may be illustrated further from the clerestory which adjoin it and from the triforium arches and transepts. Between the south or end wall of the transept and the pier which carries the dome at the great arch into the aisle and the clerestory are broken through. In a less degree, according to the subsidence of the mass of the dome, this occurs in with each dome pier.

The south transept has suffered in addition to the dislocation of the parts abutting on the dome by the movement of the south front of it to move outwards.

The walls of the southern façade have moved and have sunk slightly to the east and west: this is especially the case in the south window arch and in the upper part of the transept.

Coming to the west front two tendencies are to be seen, the one arising from the other: the two towers are out of the perpendicular, the one to the north and the other to the south; and the portico, which has been the only flimsy piece of construction in the cathedral, has followed the direction of the towers, and, in accordance with the movement, moved westwards.

In August 1901 the south-west tower was plumb height of some 113 feet, and a deviation was noticed when worked out proves that the top hangs 10 inches south-west, while the other tower inclines to a less degree, to the north-west.

The movement of the south tower has affected the building east of it, and in the library, over the west chapel, the indications of the movement are clearly seen. A further proof of the movement of the towers is the curved line of the granite steps, which were found necessary in order to avoid partly burying the columns of the portico.

These inclinations are sufficient in themselves to jeopardise the safety of the two wide arches of the portico between the towers. The towers actually form the support of these arched ceilings, which have a span of 10 feet while they do not rise to 10 feet.

the portico consists of two storeys, and the front is composed of two series of coupled columns and is not in itself a stable piece of construction; instead of the spaces between them being bridged by single pieces of stone, cornices are made use of: at the north and south these arches are without any solid abutment and yet they rest the heavy mass of the pediment. Then the ranges of columns each support a cornice which projects outwards with no similar projection to the east to balance it. Above the upper cornice the cornice of the pediment and the sculpture of the tympanum also overhang. Thus there is a height of about 112 feet, and the height of the columns supporting it 4 feet at their thickest, with considerable voids between them.

There is a very considerable repair and much renewal the dome has been restored to its original state—allowing, of course, for the increase in its span—and, assuming that the existing conditions can be maintained, may be said to be in good condition. But the secret of its weakness has been learned, and it is seen how it is on the western towers, and how they in turn support the dome by the maintenance unimpaired of the ground on which they were built.

The average depth of the foundations is 4 feet 6 inches below the crypt floor, which is 6 feet below the ground level north and south, and the footings of the walls consist of 12-inch courses of stone with a projection of about 12 inches.

In no case have these shown signs of insufficiency, nor has any organic weakness been discovered in the dome itself. Where the walls have been opened for inspection or another they have been found to be perfectly constructed. In conclusion Mr. Macartney showed the results of the borings recently made, and said that all the data tend to prove that the danger to the cathedral from subterranean or atmospheric influences. Interference with the subsoil was clearly not contemplated by Wren, and without it we might even now reduce to a minimum the cathedral's danger.

WM. DUNN, in some interesting notes on the construction of the dome of St. Paul's, said Mr. Macartney had helped him with various drawings, and with the help of Mr. Halley, he made sketches and measurements in parts which had been undisturbed for years. An aerial view displayed the relation of the whole dome. Mr. Dunn described the lantern as a massive stone structure, exterior rectangular in plan, about 70 feet over all and 50 feet high. The interior was an octagon. At the top of the great outer dome and at the base of the lantern is a belt or girdle of stone forming the apparent support for the top of the ribs of the outer dome, and acting as a base for the lantern. This girdle of stone is 10 inches in thickness and 11 feet in height. It is held by metal ties to the main body of the lantern; these are placed just below the stone floor of the golden gallery radiating from the centre. They are about 2 inches by 2 inches in section. All this heavy load of an irregular shape is supported by the apex of a hollow cone. A hollow cone is fairly stable if supporting vertical loads round its circumference, such as arise from the weight of a circular drum. It is not at all a stable form under loads such as Wren had with, unless these loads are converted into vertical loads uniformly distributed round its circumference, and that is what he has done.

The method adopted was to place on the cone a domed lantern, as we put over a well, and to use this as a foundation for the lantern. Over this domed top he distributed the weight of the lantern by buttresses, the lower parts radial and sloping, the upper parts being vertical and at angles to the square of the lantern and to each other. Like well tops, this domed top had also an eye or opening in the centre, so that in section the lantern seems to be on an arch without a keystone. Of course the reason for this stands is that, unlike arch stones, the stones of which the lantern is constructed are subjected to pressure on all four faces, so that they do not collapse inwards. But if the top of the cone of the domed top spread outwards, we should see the appearance of radial cracks extending from the base towards the top, and this would lead if sufficiently extended to the failure of the structure. This spreading of the base is usually resisted in the resistance of the earth. Wren supplied it by iron ties. The positions of these three circumferential bands were well chosen. They are close together, and as the appearance of radial cracks in the dome-top has shown that they are sufficient for the work, their effect is to convert the load immediately below each point at which it occurs into purely vertical loading. In an arch

the thrust is constant from key to spring; in a dome the thrust is constantly increasing downwards until the inclination of the surface of the dome to the horizon exceeds a certain angle. Below that angle one of two things happens—either the material of which the dome is formed gradually takes up bit by bit this thrust, until, the dome being hemispherical, the whole thrust has been gradually overcome; or else it splits into a series of arches and the thrust remains constant at the value it has at the crown-ring of the arches. But if we mistrust the material, if we are using concrete, or stone, or brick materials which have but small resistance to tension, and which may have even that small resistance destroyed, as in the case of concrete by shrinkage stresses, or in the case of stone or brick by unequal settlement, we may, as Wren has done, put in a series of bands of a material which will resist tension, and so have either reinforced concrete or reinforced masonry. The effect of each tie, providing it does not yield, is to convert the load on the point below it into a vertical load. Wren put a series of seven circumferential ties round the cone above at various points from top to bottom, with the object of making each upper section independent of the spreading of the part below from settlement or yielding of the ties. A great deal has been written about the danger of iron embedded in stone. It is a danger undoubtedly if the air is not excluded from the iron. But given unpainted iron and an impervious covering of mortar or concrete, iron does not rust, but remains bright, nay, even loses such rust as it had and becomes bright.

In concluding his remarks, Mr. Dunn said we hear a great deal of rather unconsidered talk about domes without iron ties. Domes of any size require very large abutments to be stable without such ties, and though we may put sufficient abutment when the cupola rises from the ground, as in the Pantheon, we can rarely do so when it is raised on a drum, as in the Duomo at Florence or in St. Peter's at Rome.

MR. JOHN SLATER in proposing a vote of thanks to Mr. Macartney and Mr. Dunn, said the question of the stability of St. Paul's was one that appealed not only to Londoners, but to all Englishmen. St. Paul's was a national building, and had been compared to St. Peter's on the points of good and rapid construction. Mr. Macartney's paper had dealt exhaustively with the early settlements in the fabric, and what he had said must be fairly clear, viz. that the main settlements had been on the side where the slope towards Fleet Street occurred. He would have been very glad if Mr. Macartney had told them a little more as to the results of his investigations with regard to the construction of the "tube" railway. The paper mentioned that Mr. Penrose had thought fearfully of the results of the railway if it came to be constructed, but the speaker said he had not gathered from the paper whether any of the effects which Mr. Penrose feared had really occurred. The subject was of great interest to all architects. Mr. Slater said he had himself been consulted as to the condition of Bow Church. It appeared to him that the construction of a "tube" railway was of such a nature that it was almost impossible to avoid displacement of the strata through which the "tube" was driven. His own theory was that during the time which elapsed between the first driving in of the shield and the embedding of the tunnel it was extremely likely that settlements would take place. The tower of Bow Church had tilted over to the extent of about six inches, and just after the "tube" railway was constructed there was an opinion expressed that the settlement might increase and thus seriously endanger the safety of the fabric. Mr. Slater said he took an opposite view, because, in his opinion, after the construction of the "tube" and the filling up of the space around it all danger would cease. The construction of the sewer was not the same as the construction of a "tube" railway, and Mr. Slater thought the experts were perfectly right in urging that the County Council sewer should not be constructed in the position it was originally intended to take. With regard to Mr. Dunn's paper the speaker said he was sure everyone present must have been charmed with the unique isometrical view of the dome and cupola which was shown to them. None of the members present, he thought, had seen before such an enlightened view of the construction of the dome of St. Paul's.

MR. R. PHENÈ SPIERS seconded the vote of thanks.

MR. FRANCIS FOX, M.I.C.E., believed that a great deal of the settlement in St. Paul's was due to the construction of

the sewer in 1835, in which year he believed the massive tie-rods were inserted in the building. With reference to the construction of "tube" railways the speaker said there need be no danger to buildings above the route of such works in London, provided the construction was done properly and with the aid of compressed air.

Messrs. W. WOODWARD, J. DOUGLASS MATHEWS and Mr. J. J. BURNET also spoke.

Mr. MACARTNEY, in his reply, said they had discovered nothing in the state of St. Paul's which could be said to be due to the construction of the "tube" railway. Mr. Penrose, he believed, objected to the proposed position of the station near to St. Paul's, and it was eventually carried out to Newgate Street.

## NORTHERN ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the session of the Northern Architectural Association was held on the 13th inst., at the Society's rooms, Higham Place, Newcastle.

Mr. A. B. Plummer, president, delivered the opening address. He said he stood before them as president, after having been their hon. secretary for fourteen years, and he thanked the Association for the honour it had done him in electing him to that new position. At the end of 1892 the total membership of the Association was 94; and at the commencement of this year it was 250, and they were about the largest Society allied to the Royal Institute of British Architects. Their total expenditure for 1892 was 41*l.*, and in 1906 it was 160*l.* 11*s.* 9*d.* The total income for 1892 was 58*l.* 6*s.*, and for 1906 it was 194*l.* 1*s.* 11*d.* They were now, principally by the generosity of Mr. Glover, in possession of their own premises, instead of being in hired offices.

It is hardly possible for any provincial president of an important architectural association to avoid considering and referring to the question of the registration of architects. Till such time as registration is obtained (I hope under the auspices of the Royal Institute of British Architects), I shall in all humility continue to say that I am of opinion that the Institute should take the provincial architectural societies into closer alliance, and thus also, I believe, increase the numbers of provincial Fellows and Associates of the R.I.B.A. I believe we have not yet made the advance we should have done in the matter of the registration and qualification of all architects, because the public at large have not yet realised the importance of the question, and they do not know how nearly it concerns them. Hitherto, as a general rule, the subject has been discussed only by members of the profession. The public now realise, as they did not at one time, how important it is that members of the medical and legal and other professions should be legally qualified men. I hope I shall be forgiven if I say I do not think that the great majority of people are yet capable of judging whether buildings they see are the work of able or inferior men. It is nevertheless important that architects should be qualified and determined to carry out good work, without entirely disobeying their clients' demands as regards matters of detail.

If the profession were to be unified by registration, and in future by compulsory qualification, we could take united action to have it made illegal for a district council, &c., to give a surveyor, sanitary inspector, clerk of works, or such-like official, too small a salary and then to make it more than possible for him to live by allowing him to practise and call himself an architect (whether at all qualified or not) in the district, where he should only be acting in an administrative and advisory capacity. The public are led to believe that it is necessary, or perhaps I should say policy, for such an official to act for them in preparing their plans, as they believe he cannot advise work to be rejected that he has himself prepared. This course is really not to the advantage of the public, though they may at first sight think a smaller salary is by this means being paid by the ratepayers. If there is not enough work in one district to pay the proper salary of such an official, let him act for two or more adjoining districts or make up his extra salary in some other way. At least we may say such a man's professional or unprofessional work should be submitted, in the interests of the ratepayers, to some official other than himself for preliminary criticism, selection or rejection, as is the case with plans prepared by others. I have been asked, "How is it that you, as a diocesan architect and surveyor, can talk in that way?" it being thought that I am placed in an exactly similar position. May I therefore clearly state that this is

not the case. Diocesan architects and surveyors no way to pass or reject their own or the work of architects, and all our architectural work has to be submitted for approval in exactly the same way as the work of practising architects. In any case we are not local surveyors, sanitary inspectors or clerks of works, and are in no way maintained by the rates.

It is now several years since it was decided that London district surveyors were in future to be selected with the understanding that they are not to practise as architects in their own districts, and in their case it has proved by examination to be qualified men. I think it is more this regulation is even more necessary in the case of unqualified and qualified men. It is not architecture that even capable architects should be taken into the hands of corporations, and the more and more of the important architectural work being taken into the hands of corporations, and the more therefore, many of them with regret, become of corporate bodies. Is it to the advantage of a nation that their work should be undertaken in many cases by one man, who cannot be an expert in all branches, who in some cases produces a more or less similar design for all the buildings of a city? When there is much work to be done he has to get through it as fast as possible by an increase of staff and by delegating his work to others. When there is too little work a large staff has to be dismissed, or, as is more generally the case, I fear, the ratepayers have unknowingly to keep them on, doing no work, or else work has to be created before it is necessary and has to be paid for at the ratepayers' expense. In the case of corporate bodies selecting in the interests of ratepayers the best architect for each class of work, not expecting or causing any one man to undertake more than is possible. When the work is finished the ratepayers have no longer to pay for the upkeep of an office and the work is, I think, better done and at less cost. I am prepared to say that if these assertions are examined and put to the test they will be found to be the truth. It will also be found upon inquiry that in most cases the work of corporate bodies make use of a larger staff of architects than practising architects find to be necessary to carry out similar work.

I wish to mention that there are a few other men who are am thankful they are few, who I think require the attention and criticism of the profession. I refer to those called honorary architects, though personally I am of opinion that as a rule there is more dishonour than honour in connection with such a position when permanently held by one who has not retired from the profession. An architect who is a labourer is worthy of his hire, and if a man is not paid for his work, even if he be only a tinker or a carpenter, I doubt if he will give the necessary time and attention to it, and I question if any reasonable men can expect to do so.

Excuse my using personal incidents to illustrate the sort of thing I refer to. On two occasions in the past year, my clients in connection with church work sent me my plans, &c., and proposed charges and estimates to London, to societies who make grants towards such work and require that this information should be sent to them before they will assist. On one of the occasions I refer to, the society's secretary wrote direct to me (as is their custom) and reported that they would not grant, but their honorary advising architect had recommended a proposed charge (for a complete survey and one-eighth scale plans of two floors and elevations, and architectural tracings of a vicarage) to 2*l.* 2*s.* I may say I expected the honorary architect in London knew no more than I did in the moon how far I had travelled and cycled to the building before I surveyed it. In connection with this in my account, the surveying and travelling to this building alone required a very long day's work, before my architectural tracings were commenced. The plan in question was for by the society, and the cost of the small additional vicarage was under 100*l.*; it can therefore be seen I should receive a large 5 percentage commission. I wrote to the society and protested that it was unfair to injure me, and cause my client to think that of course an honorary architect knew better than he did, and as a consequence leave me to believe that I was proposing to make an unreasonable charge. I desired that my account, which I am certain was reasonable, should be brought before the R.I.B.A., or any recognised architectural society. It is fair to say that the secretary acknowledged they had had complaints from the R.I.B.A. as to similar buildings. I was obliged to let this matter end thus, not being

to conflict with this somewhat important society. tended to let this be forgotten were it not that in of another association the secretary in like manner direct to my clients requiring alterations to some s advised by their honorary architect or architects. say exactly similar details in specification and s had on two previous occasions been passed, and r was satisfactorily carried out without the so-called ee of honorary architects having a word of fault to any improvement to suggest. However big such honorary architects are, or are supposed to be, I liberately and calmly and thoughtfully dare to think they are (shall I add perhaps blindly and ionally?) acting the part of a sneak and a unless they honestly sign their names and nd direct with the architect they are injuring, and at he has to say before or when their secretary his clients.

man wishes to help good work let him make proper for professional business and give proper attention if he is fortunately able to do so let him give the us earned to help any good cause. I am thankful at, in the two cases I have named, the so-called y architect's proposals were taken no notice of. I respectable practising architects should refuse to such permanent position or to be members of any nt committees of so-called honorary architects. re exceptions to every rule, and I know that a few ble and able men on rare occasions act as honorary s, and a few also allow their names to be on such ees, and they do little or nothing more than this. n if they have ever considered whether they are g more harm than good by even going thus far. I opinion that in the case of such committees of y architects most of the members are making up a from amongst whom the one or two men cannot ily selected, who are, unintentionally and ignorantly doing the mischief in an anonymous way. One are, however, generally suspected to be the acting ous so-called honorary architects. Why can they ch case come out into the daylight and let us have nes and know whom we have to reason and corres- ith, and who we are to expect will give proper to any business in question?

so because I know that other provincial architects so to submit to similar anonymous attacks or s, and perhaps London architects have also to do en such a society is not able to make a proper y grant let them say so and give no donation at all, cause so much trouble and misunderstanding. I urther again suggest that the so-called honorary r architects should sign their names to their and that the secretary should send out with the their remarks a copy of their signatures.

s hitherto been the custom to elect our presidents ds of two years. I believe the time has come s should no longer be the invariable custom. In case, I do not think but I know that there are ho should have been president before me. I think portant towns in our populous district could well frequently represented in the presidential chair. re desire that you should agree with me to nomi- neone to take my position for a year at the end of ion. I shall with no ungrateful feelings to the ion hope to retire in favour of a representative other town, believing that it will be for the good of ociation, and it is not because I undervalue the you have so kindly placed me in.

prizes in the competitions were announced as —Sketches—1. Mr. R. Mauchlen, Newcastle; 7. Milburn, jun., Sunderland. Measured drawings—C. Hunter, Gosforth, and Mr. Sydney Ash, Gates- ided.

## S AND YORKSHIRE ARCHITECTURAL SOCIETY.

e annual meeting an address was delivered to the embers and Associates of the Leeds and Yorkshire tural Society by the president (Mr. H. S. Chorley). es gained by student members were distributed as —Measured drawing—Mr. F. Scatchard (silver and 5*l.* 5*s.*), Mr. J. T. Pilling (bronze medal); —Mr. J. Greaves (3*l.* 3*s.*), Mr. J. H. Farrar (1*l.* 1*s.*); g—Mr. G. H. Foggitt and Mr. J. Greaves (prize 2*l.* 2*s.* each); construction—Mr. H. Carnelley

(3*l.* 3*s.*); essay—Mr. J. Greaves (2*l.* 2*s.*); sketching club—Mr. R. A. Easdale (5*l.* 5*s.*), Mr. W. P. Rylatt (3*l.* 3*s.*).

The President, in the course of his address, said it was the thirty-second annual meeting of the Society, which had had a very successful career. It had been helpful not only in bringing them together, but it was necessary if they were to be successful. They needed all the help they could give one another. They were surrounded by many and great dangers, their responsibilities were great and extended in many directions. All people were influenced greatly by their surroundings, and if the environment was sordid and devoid of beauty, depravity and a low moral condition would usually be found among the people. On the other hand, beauty was usually accompanied by refinement, a high state of civilisation and, as a rule, a high moral condition. Architecture, like dress, tended to become more cosmopolitan and less national. He was doubtful how far that was to be welcomed. Half the charm of architecture, at any rate from an archæological point of view, lay in the varying ways in which it was developed in different countries, taking upon itself the distinctive character of a people and often bearing in itself the record of a historical past. Such interest must very largely be a thing of the past, and architectural design would tend to a world-wide similarity. He believed that there was much originality to-day, but any original idea was quickly spread until it was shared in many countries. Local individuality could be maintained to a much larger extent than at present if more attention were paid to the natural building materials which a locality provided. This was a matter which architects should seriously consider. It was a pity that the old Yorkshire stone slating should be replaced by imported tiles and that the old Yorkshire flag floors should be replaced by concrete. Careful consideration should also be given to the relation of a site to the building to be raised on it. Mr. Chorley went on to refer to architectural competitions and especially to the regrettable incident connected with the competition for the Acton municipal buildings. He also spoke of the various branches of work of the Society, especially mentioning the sketching club and the library. The school of architecture in connection with the Leeds education authority was now an accomplished fact, and the classes should be of the greatest assistance to architectural students within the district. There could be no doubt that the scope of an architect's work was being increased year by year and becoming more complex, so that the training which was sufficient for their fathers would not suffice for to-day. The tendency of modern work was towards the greater elaboration of working drawings. Their profession must be progressive, but, unlike other professional men, the architect must look back. He must be to some extent an archæologist, at any rate in the sense that he should fully study the works of those who had gone before him. He hoped the students would not only avail themselves of the excellent classes in Leeds, but would also travel and sketch as much as possible. In conclusion, he said that they might congratulate themselves that the Society had had on the whole an active and successful year. For themselves as individuals they must hope for continued prosperity in the future, recognising that though few of them could be great in their profession they could all do their best, and any good and honest work was a step in the right direction.

On the motion of Mr. Percy Robinson, seconded by Mr. Edwards, of Bradford, the President was heartily thanked for his address, and a vote of thanks was also accorded to Mr. A. E. Kirk, the hon. secretary.

A smoking concert followed.

The Local Government Board have affirmed the decision of the district auditor in allowing payment of 150*l.* to the Beckenham surveyor for extra work in connection with school enlargements. At the recent audit of the Council's accounts, a member of the Council and the President of the Beckenham Ratepayers' Association objected to the item.

A Committee appointed to arrange for a memorial to the late Mr. Charles Eamer Kempe, M.A., appeal for further funds, about 400*l.* having already been privately subscribed by a few of Mr. Kempe's personal friends, to enable them to carry out the full scheme decided upon. This includes the placing of one or more windows in Southwark Cathedral and in St. Agnes, Kennington Park, and also to offer heraldic tablets to his memory to Pembroke College, Oxford, and Chichester Cathedral.

## NOTES AND COMMENTS.

ONE of the prizes of which the Municipal Council of Paris have the control is that known as the Prix Lheureux. It was founded by a lady and is to be alternately awarded to a sculptor and an architect. The value of it is 2,500 francs. The first recipient was M. DALOU, the sculptor. The second was M. CHARLES GIRAULT, who designed the Petit Palais in the Champs-Élysées. The prize, it should be remembered, is intended to express recognition of some superior work, or in other words it serves as a reward to artists who have gained renown and therefore do not need 100l. M. PASCAL, the architect, was another gainer, but somehow the sculptors have been allowed to take more than their share of the prizes. Among them are M. BARRIAS, M. ANTONIN MERCIÉ and M. COUTAN. M. FORMIGÉ was the last architect to whom the prize was offered. This year it is the turn of an architect, and the Municipal Council profess that one who is eligible is not easily found.

THE freedom with which museums and picture-galleries in France can be visited has been one of the attractions of the country to strangers. It is not unlikely that a great alteration in the arrangements will soon be sanctioned. The depredations in the Louvre have demonstrated the necessity of more watchfulness, and, in other words, the employment of more attendants. At present the public galleries are expensive and larger votes on account of them are not obtainable. The only resource remaining is payment for admission. The experiment is about to be tried in the Lyons museum. From the first day of next year a charge of a franc will be demanded from each visitor or half a franc each for the members of a party. Gratuitous admissions will be allowed only on the afternoons of Sundays, Thursdays and public holidays. As an obstacle against vandalism, pictures and drawings will be protected by glass. A railing will also be placed at a distance of 1 metre from the wall.

It might be supposed that a body of Scottish architects would be acquainted with the names of their countrymen who followed the art. They are not numerous, for with few exceptions the Mediæval rule prevailed until the eighteenth century, for the architect was not separable from the master of works or the builder. However, Mr. ALEXANDER GARDNER, as president of the architectural section of the Royal Philosophical Society of Glasgow, selected as a subject for his address on Monday "Some Notable Scottish Architects." Sir WILLIAM BRUCE, of Kinross, whose name is connected with Holyrood Palace, was the only representative selected of an earlier period. WILLIAM ADAM (1689-1748), whose name is overshadowed by the fame of his celebrated son, ROBERT, was a pupil of BRUCE, and succeeded the latter as surveyor of the king's works in Scotland. He carried out many important works, and collected and published his designs, and those of his contemporaries in a folio work, "Vitruvius Scotticus." ROBERT ADAM (1728-92), son of the former, together with his brother JAMES as partner, enjoyed a practice more extensive than that of any other architect of the eighteenth century. Glasgow owed its Infirmary and the Old Assembly Rooms to them, and Edinburgh the Register House and the main block of its University. The Brothers ADAM designed furniture in character with their apartments, of singular and original merit, adapting Classical forms to modern uses with a success unrivalled by any other designers of furniture in Britain. To WILLIAM STARKE (d. 1813) Glasgow was indebted for four public buildings—St. George's Church, the Justiciary Courts in Jail Square, the asylum in Parliamentary Road and the old Hunterian Museum.

A better known contemporary of STARKE DAVID HAMILTON, of Glasgow (1768-1843), whom we had Hamilton Palace, the Glasgow R. Exchange, Western Clubhouse, Normal School, Lennox Castle, and many of the principal buildings in the West of Scotland. A brilliant quartet of contemporary Edinburgh men were JAMES GILLESPIE GRAHAM (1777-1855), THOMAS HAMILTON (1784-1858), WILLIAM BURN (1789-1870) and W. H. PLAYFAIR (1790-1870). GRAHAM rose from the position of a working tradesman to be a leading architect; Blythswood House, Brodie Castle, St. Andrew's R.C. Cathedral, Glasgow, and the beautiful Assembly Hall of the Church of Scotland are from his designs. THOMAS HAMILTON's best known works were the Edinburgh High School on the slope of the Calton Hill, and the Burns Monument in Edinburgh and Alloway. The classical Greek buildings of PLAYFAIR were dominant features in views of Mount Athens. The fame of GEORGE MEIKLE KEMP (1784-1844), whose humble origin and tragic end formed a romantic story, rested on his one executed work—a fairy-like structure the Edinburgh Scott Monument. Among other architects treated of were DAVID BURN (1803-76), CHARLES WILSON (1810-63), J. T. ROBERTSON (1814-78) and "Greek" THOMSON (1817-75).

THE metre as the unit of length in France and other countries of Europe has importance, but it has a peculiar interest, as it is the earliest scientific product of the French Revolution. In 1790 it was proposed to arrive at such a measure by means of investigation conducted by the French Academy of Sciences and the Royal Society. The English Government would permit the co-operation of the latter body, and the mission consisted mainly of Frenchmen. What was sought as a basis was the length of a pendulum vibrating seconds in latitude 45 degs. and at the level of the sea. Several geographical and mathematical inquiries followed, and eventually the metre of 39.37 inches was arrived at. The standard is usually said to be among the national archives, but a reproduction is in the Pavillon de Breteuil at St. Cloud. It is made of platinum, and is said to have cost 18,000 francs. It has been used in an international conference on weights and measures, for the metre is the only measure of length which has a definite relation to the great circles of the earth.

THE conditions governing the competition for designs for the new county hall on the site near Westminster Bridge provide that the competitors in the final round shall vote for a third assessor to act with Mr. NORMAN SHAW, R.A., and Mr. W. E. RILEY, in assessing designs in that stage. The Council have approved the necessary expenditure (2,100l.) for a fee of 1,050l. to Mr. SHAW and the third assessor. The result of the voting of the twenty-three competitors in the final round shows that the highest number of votes was cast for Sir ASTON WEBB, R.A., to act in the capacity of referee. Sir ASTON WEBB has sent a letter to the Council that, whilst "fully sensible of the great responsibility involved," he has pleasure in agreeing to act as one of the three assessors. It is proposed to hire the Metropolitan Examination Hall, Victoria Embankment, for the display of the drawings while they are examined by the assessors, and for a subsequent exhibition to the public.

# THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. Tanner, vice-president, in the chair.

Words of thanks were passed to Mr. Hugh Stannus for bringing a small collection of photographic negatives of churches, and to Mr. Herbert Batsford for his gift of an engraving by Hollar, depicting London and its bay in 1647.

The following gentlemen were elected members:—H. J. W. Etheridge, M. S. Daly, J. A. Cheston, Annan, R. P. Annan, W. S. Holt, J. R. Truelove, French, R. D. Elliott, P. D. Hepworth and J. W.

B. J. GREENWOOD read a paper entitled—

## The Relations of the Architect to the Builder.

I am not sure where the line of demarcation is to be drawn between the subject of Mr. Gibson's paper and my own, and consequently I may inadvertently trespass upon his nerves, as he may on mine. It seems to me that a line in the relations between architect and builder would be both topics. However, if I trespass, I know of no laws applicable to the case—at any rate, such trespass cannot be prosecuted though they may be per-

me occurred to me that I might apply to your secretary for a more definite delineation of the boundaries of my subject, but on reflection I concluded that a man acts for himself when he invites limitations. They can be of no use to him and may be the contrary. So I am able to proceed with a sense of freedom of which you may think I avail myself to a rather extravagant

me may say that the relations of the architect to the builder are, or should be, confidential. I do not use that word in the sense that these relations should be private—I use it in the sense that there should be no reason why the dealings between architect and builder should not be open to all parties interested, although necessarily open to those who are not concerned—but the word "confidential" in the sense that between architect and builder there should be mutual confidence, and that their relations cannot be pleasant and are not necessarily advantageous.

The element of suspicion with regard to the builder pervades and permeates all building contracts need to be imported into the subsequent relations between architect and builder. Without adequate and unmistakable proof the builder should not assume that the architect is going to get 25s. for 17s., and without similar proof the architect should not assume that the builder is scheming to get 19s. for 17s. If in the course of a contract it occurs to the architect that some better method of securing a desired result should be adopted without detriment to the structure, and that it is to the architect a suggestion accordingly, there is no reason why the architect should jump to the conclusion that the builder is seeking any unfair advantage, even if the suggestion should afford some benefit to the author of it. The builder in the course of his business has to employ all sorts and conditions of men—often through the fluctuations of the market he is unable to know by experience the character and disposition of all those whom he has to place in positions of more or less control and responsibility, and if in any cases such persons should act without his authority or knowledge in a manner which might be described as questionable, it does not follow that the builder is untrustworthy, provided that he is ready at once to rectify his fault and stand against its repetition. I have known cases where an architect has been deliberately done badly and then reported the architect in order to damage the builder's foreman. It is unreasonable to expect that architects, who have a comparatively small staff under their immediate supervision, should have some consideration for builders who employ hundreds of workmen who are only controlled by subordinates whom he has selected to the best of his ability. Of course, the direct responsibility for the work of his employes rests with the builder; but the moral responsibility does not always follow, and I suggest that the relations of the architect to the builder should be free from any element of unwarrantable suspicion.

In the second place, the relations of the architect to the builder should be mutually beneficial. Neither party poses himself as a philanthropist. The architect expects, and rightly so, that the contract shall enhance his own prestige and reputation and gratify his clients, and the builder in

his sphere has similar expectations. The architect expects, and rightly expects, that the contract shall be remunerative, and I imagine that he very seldom if ever fails to realise that expectation, although I have heard rumours that the remuneration is not always consistent with the professional ability and energy displayed. The builder also expects that the contract shall be remunerative; but in this case, unfortunately, his expectations are frequently doomed to disappointment, and it is no uncommon experience for the builder to contribute unwillingly if not ungraciously to the cost of the building. Under the depressed state of the building trade that has prevailed during the past two years, I am afraid this experience has become lamentably common; but I think I may safely admit that builders need not be credited with motives of philanthropy in this matter, for if they contribute to the cost of their contracts, it is neither by desire nor intention, and it is not unusual for them to make laudable efforts to avoid such occurrences. The ideal result of a building contract should be to the benefit of the client, the architect and the builder, and if in either case this result is not attained, there is something wrong which should be rectified if opportunity arises, as it seldom does.

In the third place, the relations of the architect to the builder are variable—as variable as the wind "that bloweth where it listeth." This point opens a wide scope for comment, and I will therefore endeavour to abbreviate my remarks. The relations of the architect to the builder are inevitably variable because of the widely differing characteristics and customs of the individuals concerned. As to the varied individuality and customs of builders, I have very limited knowledge or experience. Builders are not particularly confidential amongst themselves; on the contrary, there is generally a considerable amount of reserve in trade relations, and the delightful theory that I believe was held at the London County Council some years ago, that builders were a happy family replete with confidence and mutual concern for each other, was altogether a fanciful apprehension. Recent experience leads me to think that builders may rather be likened to a pack of hounds when the scent is hot.

It needs a clever man to talk apparent sense on a subject about which he knows little or nothing (and there are such clever men to be found in the House of Commons if nowhere else). I therefore pass the inviting topic of the variable relations of the architect to the builder arising from the varied characteristics of the builder. (Perhaps Mr. Gibson knows more about them than I do.)

I proceed on what is perhaps more delicate ground in this audience, viz. the variable relations of the architect to the builder arising from the varied individuality of the architects. For instance, there is the autocratic architect; his relations to the builder are not as other men's. He is careful to emphasise the impassable gulf between the profession and the trade. When an audience is granted to the builder it becomes him to proceed with great deference if not with awe. If the builder has opinions of his own they must not be advanced, and suggestions or advice would be regarded as impertinence. I remember one incident bearing on this point to which I may refer, although the architect in question was certainly not autocratic. A certain limited liability company, newly formed to work a more or less speculative patent, required certain work to be done. The builder called at the architect's office to agree the contract, and ventured to ask for particulars as to the subscribed capital of the company and its financial standing. He was informed by the architect's chief assistant that such a request was quite undesirable, and that it should be quite sufficient for the builder to know that the company was a client of his employer. I imagine that if it was part of an architect's duty to guarantee the financial obligations of all his clients, it would in some cases be necessary to raise the scale of his fees.

Then we may sometimes meet the legal architect. His relations with the builder are not the same as the others; he has a patent pneumatic form of contract, so constructed that by the movement of a simple lever the commercial life of a builder is crushed out of him without any troublesome noise or struggle—a sigh and he is gone. The architect carefully explains that he will never touch the lever—unless it becomes necessary. His variation orders are printed in elaborate and legal form; variation orders are issued for additions and omissions, chiefly omissions. If in the foundations a good bottom is found at 3 inches less depth than anticipated, although in the process the builder has had to cut out concrete foundations at the price of ordinary digging, an omission order is promptly delivered. Unless

official orders are secured for every extra, there is considerable doubt whether the work will ever be paid for.

I express here no opinion as to the desirability or otherwise of this rigid form of procedure—it undoubtedly has its advantages as well as disadvantages, for the legal architect is generally just, though his justice is not often tempered with the other thing. I realise that it is becoming highly necessary that I should make an explanation—an important explanation viz. that I am now indulging in imagination and exaggeration. This may seem to be a damaging confession, but let us examine it.

It would be highly improper and discourteous and quite foreign to my reputation and disposition if I were to come before you with any personal criticisms of individuals known to me, although my careful study of human nature leads me to the conclusion that in all probability the individuals I describe might possibly be found if one searched long enough. A romance is more entertaining than a history, and I judge that if this Association exists chiefly for serious study there is all the more reason why entertainment should occasionally take precedence, so please take it for granted that I am drawing upon my imagination, otherwise I should be too embarrassed to proceed. I confessed to exaggeration as well as imagination. This latter may seem a more difficult matter to defend, but I assure you it is a virtue. Let me endeavour to prove this somewhat enigmatical statement. Here are two short lines drawn on paper; they are apparently parallel, or nearly so. I want to ascertain the truth. Are they parallel or not? How am I to ascertain this? Exaggerate the lines; make them five times as long and the truth becomes apparent.

A botanist has a certain theory with regard to the construction of a petal. A student has a certain theory with regard to the result of certain treatment on insect life. How can they test the truth of their theories? By exaggeration; they place their subjects under the microscope (which is just a mechanical exaggerator) and exaggeration undoubtedly contributes to the truth.

But you will, of course, perceive the danger of my proposition if it is unqualified, and the necessary qualification is that the exaggeration must be clearly admitted—that is to say, concealed exaggeration contributes to deception. Admitted exaggeration may contribute to the truth. My exaggeration comes under the latter definition; it is freely admitted. Caricature is only exaggeration; but who will deny that *Punch* has a mission, and frequently conveys truth in a palatable and entertaining form? And there may be a modicum of truth in my remarks under the head of the variable relations of the architect to the builder, even though I am drawing on my imagination and that with exaggeration. By-the-by, I must add that such remarks only apply to this particular division of this paper; all the other is intended seriously, I can assure you.

Now to proceed, asking pardon for such a lengthy digression.

There is the "easy-going" architect, and his relations to the builder are not as other men's. He gets out the contract drawings more or less accurately to a small scale, and virtually says to the builder:—"Now I want a good job; get it done and don't bother me. Details? Make your own details," and, beyond an occasional detail on the cuff of his shirt, no more drawings are supplied. The specification is brief and leaves ample scope for the imagination. No agreements have been made with the adjoining owners as to party walls or ancient lights; "I always settle them as we go along," and the correspondence on the contract is virtually confined to the application for and issue of certificates. Such architects, if they have a good quantity surveyor and a good builder's foreman, often get through difficult contracts with marvellous success, but it is not always so.

As a contrast to the "easy-going" architect, let me mention the "scrupulous and painstaking" architect, who holds the builder in leading strings. The foundations of a garden wall must not be put in as shown on drawings before the bottom has been carefully tested. Elaborate details are issued in profusion for every subordinate item; although it is true that, by oversight, a builder is sometimes allowed to use his own discretion as to the position in which the nails are to be driven in fixing an architrave moulding to a pantry door. I have known 100 sheets of drawings to be issued for the construction of a small addition to a private house, and it makes me sometimes anxious as to whether such voluminous services are adequately remunerated.

Then there is the "nervous" architect who writes to his

client to ask if he may issue a certificate; and through sheer nervousness and with no evil intent twice the amount provided in the contract. Rather than report a perfectly legitimate extra to his client he writes to pay the cost himself, which the builder cannot and consequently loses the money and so on.

I must not omit to refer to the "vacillating" architect. His relations to the builder are fortunately not men's. It is sometimes difficult to satisfy the architect who knows what he wants, but the labours of Sisyphus are but a trifle compared with the task of endeavouring to satisfy the man who does not know what he wants. One portion of the works and then another is pending further consideration, and the builder's drafts his men from one point to another in his vain attempt to keep them employed. I am afraid that even architects who have a thorough and practical knowledge of the works are quite unable to appreciate the serious consequences of the builder of indecision in the issue of instructions. The architect may perhaps be able to convey some idea of the consequences by the illustration of a railway-engine. By a constant expenditure of power the engine can draw its load from Euston to Rugby without stopping; but if it is to stop at a dozen intermediate stations, each stoppage is a waste of power both in arresting and restarting the train, which means more wear and tear on the rolling stock and a larger consumption of fuel, and this obviously means an increased cost. In the same way, when a builder's contract started in good running order and has selected a proper number of workmen proportionate in number to the work to be done, he can work together without waste of labour, the work can be stopped here and there without throwing the machinery into disorder and causing a definite loss of time. It is exceedingly difficult to represent on paper in a simple form. Moreover, the builder himself loses his control of his works. When a building proceeds rapidly the architect is able to form his conclusions as to what stage the work has reached at a given date, and if his anticipations are not fulfilled, he can investigate the cause and remedy the fault. But when he is told by the foreman that the work has been stopped or delayed at various points, he discovers that although his wages sheet is not in arrears, the return for the wages paid is obviously reduced, and he is not in a position to remedy the evil, the general organisation of the works preventing any effective supervision and control. I have heard of an instance where more than a dozen different drawings were issued for the same portion of a building, and then when the surveyor came to measure the variation, not one of the drawings actually represented the work as finally executed, and the architect consequently had to measure from the work itself in order to be accurate.

There is a wide-spread opinion that variations are advantageous to a builder. Well, they ought to be, but possibly they may be if such variations are made at the commencement of the contract and then adhered to. When these variations are made as the work proceeds, they involve hindrance and stoppage of portions of the work at various stages, then I unhesitatingly assert that they are a disadvantage to the builder unless they are valued at a price considerably above the prices that the builder set in his estimate for work that was understood to be done continuously without interruption. It is, however, fair to say that in many such cases the architect is to blame, because he has a vacillating client who is responsible for the situation. Here I expect that you will sympathise. Architects are doubtless painfully aware of the worry, anxiety, wasted time and energy caused by the vacillating client, who often fondly anticipates that his vacillation will cost him nothing (however much it may cost others) and is very wroth when he finds that his anticipations are not realised. When a client does not know what he wants he should not expect his architect to be done by contract, but by daywork or by an agreed percentage of profit on the cost, so that others are not made to suffer by his indecision. I venture to submit that it is not equitable that work carried out under the conditions that I have endeavoured to describe should be valued on the same basis as work submitted for work to be carried out under different and more favourable conditions. The relations between the vacillating architect (whether his vacillation is original or merely transmitted) and the builder are, always friendly, but they are inevitably accompanied by a certain feeling of resentment on the part of the architect which he more or less successfully conceals, although

poet suggests, "Concealment, like a worm i' the bud, in his damask cheek." I have ventured in a per-  
sively and possibly humorous manner to refer to  
exceptional characteristics of architects, or rather the  
istics of exceptional architects, in a more or less  
ry and exaggerated way, not for the purpose of  
n, but for two reasons—(1) Because they directly  
e subject of my paper, "The Relations of the Archi-  
the Builder"; (2) so that you may grow sympathetic  
builder in his difficult position, and perhaps admire  
summate skill with which he sometimes steers his  
rk clear of the rocks which surround him. That  
would please one architect would often offend  
; that which one approves another condemns, and  
the poor builder to do? One architect will say, "I  
ay for that extra work; you should have obtained  
n order at the time; go and look at your contract."  
the next case, when the simple-minded builder  
—not, not "refuses," but "indicates his unwilling-  
o carry out verbal instructions until they are con-  
by an official written order—the architect regards  
ude as an imputation on his honour, as an inference  
word is not to be relied upon, and the innocent  
is regarded as a vexatious and litigious person.  
ere is nothing surprising or extraordinary in all  
simply confirms my statement that the relations of  
itect to the builder are variable in consequence of  
ed individuality of architects. But the builder still  
s, and in an experience of over a quarter of a cen-  
ave had dealings with architects possessing, to a  
less extent, all the little peculiarities I have been  
ough to exaggerate, and I confess that in the long  
e builder has more cause for congratulation than  
int.

what about the varied individuality of builders?  
do architects have to put up with? I know very  
out this matter, but I know that the architects have  
actual remedy that builders have not. A builder  
ut up with the varied customs of architects; but  
ts can easily escape all these vexatious variations  
ders by a very simple expedient which my innate  
y makes me hesitate to indicate. But the position  
y here this evening calls for self-sacrifice, and  
a sense of duty sufficiently powerful to even  
ne my timid modesty; so with blushes which  
ot be apparent externally, I suggest that all the  
us variations in the customs and practices of builders  
be avoided if all the architects in this honourable  
tion were to systematically place their contracts  
e firm I have the honour to represent (without com-  
). Having surmounted, or rather wriggled through  
st delicate and dangerous part of my topic, I proceed  
sense of relief to remark that the relations of the  
ct to the builder are judicial. When a professional  
any other man is appointed, retained, employed  
munerated by one party, he is generally bound in  
to seek to protect and promote the interests of that  
clusively. But an architect holds a very peculiar  
ique position, for his duty is not to promote and pro-  
clusively the interests of the person by whom he is  
ted and remunerated and from whom he may expect  
appointments, but to act impartially, judicially be-  
his client and the contractor, who has nothing to do  
s appointment or remuneration. The position of an  
ct in this respect is obviously difficult, if not contrary  
are, and can only be rightly held by men of high  
les and honour. I say that it is an exalted tribute  
architectural profession that with so few exceptions  
sition is consistently held with such rectitude and  
ty that one is accustomed to expect it as a foregone  
sion.

this particular aspect the architectural profession  
to be placed on a higher pinnacle of honour and  
ty than even His Majesty's judges; for I suppose  
ter a judge was appointed to try a case, if it was  
ed that one of the suitors in the case had secured the  
appointment and was providing his remuneration,  
ine that public opinion would declare that these facts  
disqualify the judge from acting judicially. But in  
se of an architect, public opinion raises no such  
t, and he exercises his judicial functions under  
r unfavourable circumstances with conspicuous honour  
ility.

one need wonder that architects holding such a  
n require an arbitration clause inserted in building  
cts; for, under such circumstances, the responsibility

of dealing judicially with all the different and varied situa-  
tions that arise in the ordinary procedure of a building  
contract must be sufficiently onerous, and when questions  
or disputes arise on delicate issues in which the architect  
may be more or less personally and directly involved, it  
must be an unspeakable relief for him to be able to lay  
aside the responsibility of decision and refer the issue to  
some eminent disinterested expert. As I have already  
hinted, it is not every architect who fully realises the  
judicial relations of the architect to the builder; and there  
may be some new to the profession who have not yet  
entirely succeeded in putting aside the natural feeling that  
they are only the agents of the person or persons who  
appoint and remunerate them.

I may mention, in conclusion, that the relations of the  
architect to the builder are, or should be, co-operative.  
They are both devoting their energies and abilities to a  
common end, and mutual assistance is of mutual benefit.  
The builder may render considerable assistance to the  
architect, and *vice versa*, and this statement is so familiar  
that it needs no emphasis or illustration. The head cannot  
say to the hand I have no need of thee, nor can the hand  
say to the head I have no need of thee. I imagine that the  
discussion on such papers as these will be far more inter-  
esting and entertaining than the papers themselves (I  
apologise to Mr. Gibson—I mean than *my* paper *itself*), and  
for this reason I will not occupy further time; but having  
merely introduced the subject, I beg that if in my brief and  
diffident remarks I have been in any way indiscreet, you  
will be generous enough to put it down to want of experi-  
ence rather than want of courtesy or good feeling.

Mr. JAMES S. GIBSON contributed a paper from the  
architect's standpoint.

Somehow, the relations between the architect and the  
builder, he said, seem to be accepted by us without question  
or demonstration, just as the laws of gravitation, and  
although we drift almost automatically into the acceptance  
of these relations, it may be that the younger men here will  
find the little I have to say helpful in directing their atten-  
tion to what is one of the most important matters incidental  
to the practice of their profession.

The consideration of this subject implies the pleasant  
knowledge that the architect has secured a client; that he  
has prepared all his designs and written his specification;  
that quantities have been taken out. The builder then  
appears on the scene with his estimate and offers to erect  
the building in accordance with all these particulars. So  
far all appears to be plain sailing. I will not at the present  
time touch on the trials and troubles of the architect, either  
with his client, his design, his specification or the quantity  
surveyor; these are, perhaps, subject matter for a separate  
paper dealing with the woes and worries of an architect's  
career; and as you will later inevitably experience them,  
it would be a species of refined cruelty to read you a paper  
about them at this early stage of your career. But, having  
surmounted all these initial difficulties, the form of contract  
is signed by the client and the builder, and everything is  
thereby in order for the work to be started.

The form of contract which will be signed in prac-  
tically all metropolitan areas will be the form issued by the  
Institute, and everyone of you should know this form in a  
real sense; that is, you should know its meaning and  
purport, not its mere word, so that you may be able to act  
upon it when necessity arises. I would commend it to your  
serious consideration for the purpose of understanding its  
fairness and impartiality between all parties to the con-  
tract and to realise the responsibility which it throws upon  
you as architect and as referee in all building operations.

I should like to direct your attention to the practical  
obligations you have towards the builder to enable him to  
do his duty to your client. The very first thing which you  
must do is to supply the builder with a copy of the draw-  
ings upon which his contract is based; these, together with  
the specification and quantities, enable the builder to  
ascertain approximately the quantity and quality of materials  
and labour necessary to do the work. The drawings must  
be accurate, that is, they must be not only accurate in the  
sense that they fit the site of the buildings, but they must  
also be accurate in that they are workable. This sounds  
like the utterance of a platitude, but I have seen plans sup-  
plied to a builder which showed that the site had either  
been wrongly surveyed or never surveyed at all; in con-  
sequence all the plans had to be redrawn to fit the land.  
The levels should be accurately taken and the drawings  
made to suit the contours.

The drawings should be workable; by that I mean that

they should be practicable in construction, the points of support properly designed and worked out, the flues, staircases and lift wells delineated from the bottom to the top, and nothing left to chance. The drawings and specification should also be clear and unmistakable in their intention. A drawing which is incomplete, sketchy or inaccurate is certain to lead to misunderstanding and perhaps to serious trouble. A specification which is ambiguous, or involved, or not sufficiently detailed, is sure to be a hindrance rather than a help. We have now established three points; your drawings must be clear in their intention, accurate and workable. In addition to all this, your designs must be made so as to comply with the requirements of the authorities governing the building operations, and for the purposes of this paper I will suppose the buildings are to be erected in London. This necessitates, on your part, a thorough knowledge of the London Building Acts, and I consider it no mean feat if you can accomplish this, as the various Acts are so involved and complicated, and have been interpreted in such diverse ways, that it has become a matter of considerable difficulty to know exactly how far they are applicable to each building. Within the metropolitan area you will often find it necessary to make special applications to the London County Council for such things as lines of frontages or building lines, projections of bays, oriels, balconies and cornices, means of escape in case of fire, separation of parts of buildings, methods of construction, and a host of other things which, if not applied for in time, will mean delay in the building operations. These special applications have to be accompanied by drawings, and often interviews and explanations have to be given to the authorities, and these things take up a great amount of time. If you have not foreseen and provided for this the result will be that the builder may be stopped or cannot proceed as quickly with his work as originally intended, and so delays are caused for which the builder can in no sense be held responsible. You all know how important it is that London work should be completed within the contract time; usually very heavy penalties are inserted in the contract for delays in completing, and I would impress upon you the obligations you are under to your client and the builder to make all the necessary applications to the proper authorities in plenty of time, so that the builder may be enabled to carry out his part of the contract. We will, however, assume that you have secured all the necessary consents of the authorities, and the builder therefore starts the work on the best terms.

The next matter that arises is to provide him with all further drawings, full size, and instructions from time to time so as to enable him to go on continuously with the works. You must remember it is the builder who is responsible for getting the structure erected within the contract time, and when he makes any reasonable request to you for additional drawings or instructions you should at once supply all he requires. I am afraid the architect does not always do this; he may be pressed with other matters or not in the humour of doing that particular job; but any unjustifiable delay in providing the builder with drawings and instructions may be a very serious matter for the architect. It may appear to you that there is no particular hurry to make certain drawings; you think a few weeks later will probably suit just as well. But you must recollect that the builder has to make arrangements far ahead of the requirements of to-day, and you will rarely find that he asks for drawings without good and sufficient reasons for doing so.

The next practical point I would direct your attention to is the employment of sub-contractors. As you know, sub-contractors, or specialists, are largely employed on all contracts. They are usually nominated by the architect or client, and carry out their works for the builder, who is responsible for them, and who is usually paid a percentage or profit on the amount of the sub-contracts. You may occasionally find a client who is desirous of omitting from the main contract a number of the sub-contracts, for such things as grates, electric fittings, sanitary goods and decorative matters, and often this is done for the purpose of obtaining a portion of the discounts usually allowed to builders. On the face of it this appears a reasonable and equitable thing to do, that if the client can save for himself a builder's profit on sanitary goods, electric fittings, grates, &c., he is a wise man to do it; but you, as architects, must look at the equity of the transaction as between both parties.

There are two points in relation to the builder's claim for profit which demand your attention; say we are dealing

with a contract for a house costing 5,000*l.*, and includes 75*o* of provisional amounts. If the client takes these moneys directly and saves 75*l.* by so doing, he certainly has to pay the builder, or some other party, for the handling, delivery and fixing these goods, but the establishment charges incurred in dealing with the goods in charges for fixing sanitary goods, grates, tiles, fittings and such like things, there is a possibility of diversity of opinion on values, especially if all the articles themselves have been deducted from the contract as an axiom that what the builder loses in one place he can make up in charges for materials and fixing, &c. I always strongly advocate paying the builder a reasonable profit on all sub-contracts, varying from 5 per cent. to 10 per cent. on their value, as being the most satisfactory and equitable way of dealing with these matters.

The second point which claims your attention is that the builder has been invited to estimate for a complete house to cost about 5,000*l.*, and the condition is implied, expressed, that the goods and labour included in the estimate for provisional amounts shall be supplied by the builder, and upon which it is only reasonable to calculate on obtaining a profit when making up the total of his estimate. As the builder is primarily responsible for the execution and maintenance of all the works, and may, and almost always does, protect himself against the sub-contractor, it is sometimes the case that the builder has a proper objection to the appointment of a sub-contractor who may be nominated for certain works, and the builder should give the very greatest consideration to that before making any appointment. On the other hand, the client must be extremely careful not to accept the nomination of any sub-contractor by the builder without first satisfying yourself that he is the proper person to be entrusted with your work, as no excuse will absolve you from liability to your client.

There are a great many matters in connection with building operations, especially in the use and introduction of new materials, new types of fittings and appliances, which the experience of the builder may be of great value to us, and I have always found them ready and anxious to put their greater experience at our service, and I frequently availed myself of it to the manifest advantage of the work. Life appears to be too short for us to have a practical acquaintance with the thousand and one materials and materials that are brought before our notice, and patient and persevering gentlemen who climb over the wall and lie in wait for us on the doorstep, to show us the things with which we have not even a bowing acquaintance, and weird inventions we can hardly understand. Regarding the majority of these things, I am sure these gentlemen would do well to cultivate the builder more and more, and to be less, and by doing so the time of all parties would be economised.

I believe it to be almost impossible to carry out building operations without variations on the original designed works, and I certainly believe it to be almost impossible to carry out works of real architecture without variations; but I must counsel you to deal with variations in a business-like way. However small the important variations may appear to be, always give the builder an order in writing, or a letter or a drawing to make it quite clear between all parties that something now proposed to be done which was not originally intended. There are instances, many of them, in which you will give verbal orders when you are on the works, such as depths and dimensions of foundations, the builder will use pier in cement instead of lime mortar, the altered position of a flue or the course of a down pipe; but make these at the time in your note-book, and as soon as possible thereafter put all these instructions in writing and send them to your client and the builder. This will save a great deal of body trouble in adjusting the accounts at the conclusion of the contract, and will free your mind from a lot of petty details during its progress. Whenever you possibly can, have a certain amount of these variations fixed before giving the order, and you will find the quantity surveyor of great help to you in these matters; and get your client's approval of them. You should always know just how matters stand in relation to the contract. On the more important architectural matters you will probably have to do with the sculptor, and even in a minor matter like this, conclude your consultations with him and get the modelling executed at the earliest possible stage. It is astonishing how much expense and inconvenience and hindrance to the work can be caused just because the sculptor and the archi-

de up their minds how the decorative sculpture is to be treated. And when you reflect that the builder has to do everything for the sculptor to work on, to get the joints of the stonework in the right positions, so that a joint does not come right down the middle of the face of Diana, or a horizontal joint cut off her chin, and that these joints must be worked back to depths to suit the sculptor, and a thousand and one other matters of a like kind, I am sure you will agree that equity to the builder requires on your part a large measure of foresight in dealing with the work.

Turn now from the practical side of this matter to the more important one—the ethical relations of the architect to the builder—and desire to say a little on two aspects of this relationship. The first is between the architect himself and the builder, and relates to all the things involved in carrying out his designs as he desires. We all know that we have prepared our designs they represent what, at the time, is our best ideas of how the building should be built; but as the work advances, and especially if it is a large building, the erection of which takes one, two or three years, fresh ideas come, and we modify and alter the original design in many ways. In this there is a strong temptation to the architect to get his later ideas carried out by the builder without extra expense to the client; but this temptation must be resisted where it is inimical to the fair treatment of the builder. Remember, we start out with a contract based on drawings which show what we intended to build at that time, and if we frequently change our ideas so that additional cost is incurred, we must see to it that the builder is recompensed for that extra cost. The architect is sometimes in a difficult position with his client; he knows that his ideas are the best, and that his client expects the best, but he is often against any additional expenditure. But the architect's clear duty is to lay before his client his later schemes and get his consent to these, and if, as is sometimes the case, giving the builder instructions to do the work and risking his client's approval of additional cost. In a great many minor things there are variations, but we always find the builder willing to meet us in a reasonable way; a spirit of give and take on both sides enables an architect to get a better result for his client without incurring any loss to the builder. Some time ago I heard of a firm of builders who kept a large staff to go through all the drawings, specifications and instructions of the architects for whom they worked, so that if a moulding girthed 9½ inches instead of 9 inches a variation might be made, without taking into account the fact that a moulding of 6 inches may be more to work than one of 9 inches, owing entirely to its shape. The result was inevitable; the cost of finding out these variations far exceeded any monetary advantage gained, the confidence and sympathy of architects were lost and the firm passed out of existence. I also know of an architect in the North who prepared his own estimates, this being a common practice there, and he used to measure up ordinary three-coat plasterwork with such exactitude that every eighth of an inch was measured and the result was a result that he became the best-hated man in the district, and so you may see there can be faults on both sides. Perhaps the most important relation of the architect to the builder is that of seeing fair play between the desires of the client and the obligations of the builder. As a general rule clients are content to abide by the decision of the architect in all matters relating to the interpretation of a contract; but it sometimes happens that a client has misunderstood the contract or expects a great deal more from the builder than the contract warrants. Should this occur it is the duty of the architect to hold the balance fairly between both parties, and this has been so done by architects who have obtained the confidence and respect of all the able builders in these matters. It will be your privilege one day to carry on this fine spirit of justice and equity, and I am sure you will ever have before you the illustration and example of those who have always endeavored to keep the architectural profession free from any suspicion of unfairness in all its dealings between architects and contractors.

Mr. LOUIS AMBLER, who proposed a hearty vote of thanks to the authors of the two papers, said Mr. Greenwood was very modest in suggesting that his views were exaggerated. His paper had made architects out to be ideal people, and nothing that was nice, except in one or two instances. Mr. Ambler was not quite sure that there was so much exaggeration in the paper because many of the extreme

cases quoted would often occur in practice. He thought one of the reasons why the architect was sometimes considered to be vacillating in his work was because the client was often undecided. Regarding the individuality of builders, a point Mr. Greenwood had passed over in his paper, the speaker said all architects would agree that there was quite as much difference in the individuality of builders as there was in the individuality of architects. It seemed to him that one met builders who gave no trouble and others who seemed to make trouble the whole time they were engaged on a job. Mr. Gibson, in his paper, had covered the whole ground as to the relations between architects and builders. He seemed to have met a number of ideal builders, and they could congratulate him on having been so fortunate.

Mr. G. NICHOLSON seconded the vote of thanks and remarked that it seemed to him impossible for the architect to find his contract remunerative on small houses, unless several were built from one design. With regard to builders, he thought architects had great sympathy with them, more so than the client, and it was in keeping with that sympathy that he believed it was not fair to put first-class building firms in competition with outsiders who might do scamp work. Then, too, alterations and variations should be paid for at full prices according to schedule.

Mr. F. D. CLAPHAM suggested that as they had to spend the rest of their lives in dealing with builders, it was very necessary that their relations should be of a friendly character. They could certainly help the builder, and mostly, perhaps, by avoiding delay in supplying drawings.

The CHAIRMAN in some concluding remarks said he hoped Mr. Greenwood had mostly exaggerated in his paper. The relations between the architect and the builder would vary he thought on every different job. The chief duty of the architect was to hold the balance between the builder and his client. He had smaller experience than Mr. Gibson, but he could endorse his statement that the relations between the architect and the builder were generally most satisfactory.

## THE SCIENCE OF THE BEAUTIFUL.

AN address was delivered by Mr. J. Lavery, R.S.A., vice-president of the International Society of Sculptors, Painters and Gravers, last week, to the members of the Bolton Arts Guild, of which he is president, and Mr. J. B. Gass, vice-president. Mr. Lavery observed, says the *Bolton Chronicle*, that art was a very big question, and had been defined by someone as the science of the beautiful. To him that was a perfect definition of art, for it had no other object than to beautify. The intention of the artist, he considered, was to search for beauty and represent it to those who would look at it. Art had been described by writers as having various meanings, such as decorative, ornamental, art as applied to manufacture, and new art. The last definition, in his opinion, was absurd, because art could not be new. Mr. Lavery then proceeded to treat of the various departments of his subject and his profession; and, dealing first with decorative art, described it as the beautifying of objects—the giving of additional beauty to any object, whether it be a piece of cloth, furniture or wall-paper, without losing the material. That was to say that if they decorated a piece of wall-paper it still remained a paper; if they decorated a chair it remained a chair, and was not transformed into something they could not sit on. The Japanese—and, perhaps, the Chinese—were, to his mind, the people who understood the exact meaning of the word decoration, for, while carrying it into effect, they were very careful to retain the utility of whatever they touched. In regard to ornamental art, he did not quite understand what was meant by the term, for to say that a thing was ornamental was to convey the idea that it was not useful. When art interfered with the utility of a thing it could not be right. Dealing with the subject as applied to industry, that, he would say, was perhaps the greatest art. The sculptor was at his best when producing a beautiful object, but it was not necessarily useful. The artist who applied himself to an industrial object added to it that which was of greater value, and was thus of more use in the world than the mere pictorial artist.

There was a curious sentiment attaching to the artist; he was excused for a great many things because he was an artist and therefore not a reasoning person. It was quite right of guilds such as that under whose auspices they were met to promote the study of art, but to promote art itself was impossible, though it was generally thought capable of

accomplishment. They could not make a man an artist; he occurred and was there, but they could promote the study of art, and he commended the work of the guild for what was being done in this direction, expressing the opinion that it was adding to the greatness of Bolton. It might interest those present to hear the views of a painter of what might be considered a way of acquiring knowledge of painting. They began with technique. It was necessary to learn to see things, and if they would do this they must first master the drawing of them, for without drawing painting was an incomprehensible tangle—the brush was broad-pointed and the material became unmanageable. Having got the length of a painting, the question of colour arose, and they could only master that if they had the gift of the eye for it. If they had it they could develop the faculty; without it no amount of training would make them see colour. This was a quality that all the great masters possessed; he knew none who was not a great colourist. Dealing with water-colours and chalk-drawing, Mr. Lavery said these in the same way required a natural or born instinct for colour, and without it they could never excel. In reference to portraiture, it was a general idea that the first quality required was likeness, and that to be perfect it should be "speaking," but while he did not say there should not be likeness, he would certainly say there should not be "speaking" likeness, because there was nothing could be more offensive than anything that simulated nature. That realism in art was wrong. The realisation of nature pure and simple was wrong, for if that were the highest form of art they would have nature and art allied, and they would not be able to tell where one began and the other ended.

Art was a thing reproduced by the artist, and a man when he was painting was in the atmosphere of a picture and not in the atmosphere of reality. He did not mean to say that the portrait of a lady was to be "prettified," for when he spoke of beauty he did so in the highest sense. They often went to an exhibition, looked round, and made up their mind what were good pictures and what were not. They did not admit they were all good. There were some faults they found, and, of course, these they gave the artist, but the virtues only they accepted as their own because they saw them. They did not realise that a fine picture took just as long to know as a fine man or woman. They could not see it at once, and even if they had it alone on the wall and spent merely a minute or two looking at it they would still not know it. But to see 100, 500 or 1,000 pictures and give an opinion on them was of doubtful value, even from an artist, because the sense of sight was so keen that the instant they saw an object, what was seen was conveyed to the brain and the eye ceased to see it. The eye was more sensitive than the keenest photographic plate that had yet been made, a fact which could be scientifically demonstrated. They looked with their knowledge and not with their eyes. Another question which appealed to him as chairman of the International Society was the one of internationalism in art. There was an idea more or less general that a man could not paint or be an artist unless he painted and studied amongst his own people. It was a common thing to hear artists, when pictures came up, say "That's a foreigner," meaning that they must criticise it. Nationalism in art was a great thing; he felt that it was the one thing which was universal, that an artist could speak to any living being through his art and be understood equally well. If they became so patriotic that they could only look with eyes of prejudice on foreign work, then the National Gallery would really be a poor exhibition, because they would have to remove nearly all the great masters. In conclusion he tendered thanks to the chairman, and expressed his indebtedness to the guild of which he had the honour of being president. He felt strongly that he had been backward in not coming among the members last year, but now that he had rectified the omission he was impatient to thank them for their kindness to him.

Mr. F. Balshaw moved a vote of thanks to Mr. Lavery, and Mr. J. McKelvie, M.A., seconded the resolution, which was adopted.

The Edinburgh Dean of Guild Court last week passed the plans for the cattle markets at Gorgie. The Lord Dean of Guild complimented the architect on the way in which the plans were prepared, and expressed the hope that the work would be pushed on, and that the slaughter-house plans would also be brought before them as soon as possible.

## ARCHÆOLOGY AND CLASSICS.

A LECTURE on "The Relation of Archæology to Classical Studies" was delivered by Professor V. Ridgeway, Disney Professor of Archæology and B. Reader in Classics in the University of Cambridge, at the Classical Association of Scotland on Saturday.

Professor Ridgeway said it was a patent fact to within recent years, and for a long time before, there had been a growing feeling against classical studies. The result was not simply the work of Philistines or of science; the worst symptom of the whole matter was much of the discontent with classical learning, and especially with Greek, came from those who themselves had a classical education. He did not think we could say much of older classical scholarship as a training for literary work. Yet what was the value of classical studies? Why had they caught hold of the best minds ever since the Renaissance in this country and every country in Europe? It was literature itself which was the chief element, and something which could tend to darken it, to encumber it, and to be regarded as hostile to the best interests of classical education. He was inclined to believe that the reaction against classical studies had been entirely due to the methods of classical scholars themselves. The success of classical studies must depend on how these three elements—literature, verbalism and archæology—were united in each other. He took it that this was the true key. Language was the key by which the student entered into that treasure-house in which the kings of the ancient world—great minds, great philosophers and thinkers—had left us their treasures. Archæology came, and with her lamp illumined for us many crevices of that chamber, and showed us priceless treasures, the existence of which we would otherwise have suspected. In this struggle, as it were, which had too often gone on between literature, verbalism and archæology, let them realise what archæology could do. He would take a familiar example. If the ordinary person came to read Shakespeare or to see a play performed at the theatre who had no knowledge of old English antiquities—material antiquities he might know, and also had no knowledge of old English life, and of the way in which things were done in old times—he would be covered with all kinds of cumbersome notes from Johnson downwards, distaste naturally followed, and the products of the divine bard were to him far from being a subject of enjoyment, only an element of nausea. On the other hand, if a man came to the study of Shakespeare with knowledge of the customs of the time—Elizabethan houses, fine old castles, material remains—and also with a proper appreciation of the ordinary objects which surrounded the life of the time, from the queen herself down to the peasant, the allusions were perfectly easy, and the reading of the plays in performance was a matter simply of unalloyed delight. He believed that the revival of the interest in Shakespearean drama in the last thirty years was largely due to the great outburst of interest in the antiquities of our own country which had spread to all classes. It was thought necessary for us to use every adjunct of the way of reality as regarded material which we could use to elucidate Shakespeare and Chaucer, who, after all, lived only a few centuries before ourselves, how much more necessary was it to make use of every means at our disposal to place ourselves at the standpoint of those who wrote that literature that grew up some two thousand years ago?

It was not merely a matter of desire to elucidate classical authors; it was a matter of primary importance that we should regard the study of ancient history as being one of the best mental exercises that could possibly be devised. They wanted to teach the student to project himself into his own surroundings and to make him think if he possibly could as the people thought in the time of Shakespeare, Chaucer, and still better, to realise the standpoint and attitude of the age of Pericles. That was a real intellectual gain, and whether they were to be administrators or governors of other great colonies, it would enable them to be sympathetic and most appreciative of those who had grown up in surroundings and environments very different from their own. After discussing what classical antiquities had done for archæology, the lecturer said it was of the greatest importance to us in some ways to rehabilitate those ancient historians, but after all that was not so much. He maintained that there was behind that much greater principle—that to have case after case

a statement of these ancient writers was proved to have altered our whole moral attitude towards history. It quickly abolishing among the younger generation of scholars that poor pettifogging spirit of scepticism which held that the only way in which a man of ability could make his scholarship was by declaring that a certain writer in this or that great writer was simply a false prophet or a sheer invention. Therefore he thought that the effect upon the scientific study of history was enormous and would be more so in the process of time, and it was entirely due to archæology. Dealing, in conclusion, with the obligations of archæology to scholarship, Professor Ridgeway said there could be no doubt that the first duty of the classical archæologist was to have an accurate knowledge of the languages of Greece and Rome, otherwise he was liable at every moment to make blunders. In the face, without literature lightening up the material he had he was maimed and could perform only half his duty. After all, what was the relation of the three sciences—literature, grammar and archæology? There was no question at all about it to his mind, and he spoke to the minds of most, that it was literature which opened for us the things of the spirit and of the mind, the spirit was above all things material, so literature and the trinity must be before and the other two must be after. Archæology and the work of the grammarian must be secondary to the real object of classical study, namely, literature itself. The three taken together, properly combined and interwoven, would make that triple cord which is not quickly broken—nay, rather he should say, a cable which for generations to come would be able to hold the mooring to classical studies in every system of education.

Professor Phillimore, in moving a vote of thanks to Professor Ridgeway, said that nothing was more important than the conclusion the lecturer drew, that we were recovering our history, but he would not say slowly—indeed, rather from an age which suffered from a positive mania of credulity, when they had only to go about and find things to disbelieve, and they passed for men of science. The conclusions of archæology were the conclusions of common sense. Just where pedantry in one line of study had deviated from common sense, just there archæology had come to the rescue and put us straight. Archæology had now proved by positive demonstration that common sense had set out by believing—that on the whole the historian was probably to be trusted; any other safe starting-point was the credulity and the error of history until they had proved to the contrary. The Chairman conveyed the thanks of the meeting to the lecturer, and Professor Ridgeway's acknowledgment closed the proceedings.

#### A READING PAGEANT.

At a meeting last week of the Berks Archæological Society, the Rev. P. A. Ditchfield read a paper on "The Reading Pageant," in which was presented his suggested programme for such a display. Reading was, he observed, not only locally far and away the most important town—next to London—outside London, and if that meeting served no other purpose than to recall that fact, he should be satisfied. There had been some difficulty in making a selection of incidents, owing to the necessary limitations; but he had reduced the matter into thirteen episodes or incidents, with each a tableau, some being historic and some dramatic. Ditchfield then presented his "episodes," for which he had written a "book" in sonorous blank verse. The "episodes" were, according to the *Reading Mercury*, arranged in the following order:—I., the conversion of Reading, the coming of St. Birinus while Saxon warriors were gathering in the harvest, Birinus and his monks singing a Latin hymn. II. "Alfred and the Danes" the invasion of the Danes and the contest between Alfred and his Saxon warriors, who then go off to chase the Danish wolves, and free our England from the ruthless foe." Episode III. is the founding of the priory of Queen Elfrida, widow of King Edgar; the queen blesses her and the queen goes to the altar. Queen Matilda coming to Reading Abbey shows her devotion by the abbot and monks. The abbot expresses regret at her coming, as he had just previously entertained King Stephen; but finally the queen, threatening him, compels the holy man to yield to "stern necessity." IV. is "the consecration of the abbey and the fight between Henry Earl of Essex and Robert de Montfort."

The abbey is consecrated by Thomas à Becket, Archbishop of Canterbury, and a very gorgeous procession accompanies the prelate—kings, lords, knights and bishops. Subsequently the trial by combat takes place between the two knights, the Earl of Essex being slain. Episode VI. is Heraclius, Patriarch of Jerusalem, offering the keys of the Holy Sepulchre to King Henry II. The monks singing "Sumer is i-cumen in," Heraclius is received by the abbot and enlarges on the glories of the abbey, and, the abbot having introduced him to the king, describes the terrible sufferings of pilgrims in the Holy Land, and moves the knights and others to persuade the king to undertake the pilgrimage. The king replies that he cannot leave his kingdom, but hopes that a son of his "may gladly dare to rid thee of thy foes." Next comes the granting of the first charter to Reading, and coupled with it "the affair of the Oxford Students"—very graphically described by Mr. Ditchfield. Episode VIII. is the marriage of Blanche, daughter of Henry Plantagenet, to John of Gaunt (spectacular), and IX. "The fall of Reading Abbey," including the visit of Dr. London, the king's commissioner, and subsequently the farewell to his sorrowing people of the abbot as he is led away to execution. The visit of James I. and his queen to Reading—when a masque is performed before them, and a "clever Reading boy" (afterwards Bishop Laud) is presented to the king, comes next. Episode XI. is concerned with the Siege of Reading, and XII. with the visit of Charles II. and his consort to the town. "The Reading Skirmish" was Mr. Ditchfield's suggestion as the final episode. A messenger calls the Mayor and Corporation out of church with the news that the enemy are at Hungerford. After a lively and amusing dialogue the councillors are about to retire to discuss the news "in solemn conclave" when an Irish regiment of James II. arrives and is defeated; the townspeople welcome the Prince of Orange with joy, and the tableau closes with the singing of the quaint local ballad, "Five hundred papishes came here to make a final end."

Mr. Ditchfield's scholarly and able paper was listened to with great interest, and was followed by considerable discussion, in which the difficulty of finding a site and the probability of considerable financial loss were argued, while it was admitted on the other side that Mr. Ditchfield had presented a most admirable scheme, and that the history of Reading afforded most illimitable material for pageant making. Eventually it was agreed that it would be desirable to hold a pageant in Reading, subject to the necessary financial and other arrangements being made; and it was left to the committee of the Society to appoint some of their members to meet members of the Reading Corporation on the matter, and to take any other steps they might think advisable to give practical form to the scheme so ably adumbrated by the hon. secretary.

#### METROPOLITAN IMPROVEMENTS.

THE attention of the improvements committee of the London County Council has frequently been called by the Building Act committee or by the Council's officers to favourable opportunities, owing to the rebuilding or extensive alteration of property, for effecting desirable improvements. There is no system, however, at present in force by which they can insure receiving early notice of building operations along the line of suggested or authorised improvements, and cases have occurred where information has not been obtained until it was too late to take any effective action. In order to remedy this defect the district surveyors, it is said, should be asked to notify the Council of building operations in such cases. The Council have no power to require district surveyors to give this information, and it is therefore considered that the Council should sanction the payment of a fee of 10s. 6d. for each notification. The cost for the current financial year will probably not exceed 50l. No provision for the expenditure was made in the annual maintenance votes and it will therefore be necessary for the Council to approve a special maintenance estimate.

Mr. A. E. Pridmore, past president of the Society of British Architects, who for fourteen years has been one of the representatives of the Ward of Bishopsgate in the Court of Common Council, sent in his resignation last week to the town clerk at the Guildhall.

## WINCHESTER CATHEDRAL.

THE Bishop of Winchester in his monthly letter says :—  
 "The statements made at our Diocesan Conference by the Dean of Winchester, Canon Valpy, and our eminent architect, Mr. Jackson, have once more brought before the notice of the whole diocese, and of the country generally, the anxiety which is felt for the safety of Winchester Cathedral. Once more I commend the subject to the prayerful thought and generous sympathy of Churchmen. There are still, I believe, many parishes from which no offertory has yet been sent to the assistance of the Mother Church. It is my request that any omission of this kind should be rectified. There should be no parish in the diocese which has not in this way testified to its relationship to the cathedral of the diocese, and to the corporate feeling which binds us all together. As this subject enters into our thoughts and perplexities as a diocese, it is right that it should be included from time to time in the prayers and intercessions of our people. On this account I have sanctioned the use of a special prayer which may be employed in our churches."

## The Present State of St. Paul's Cathedral.

SIR,—For some years now the condition of St. Paul's has been causing the responsible authorities and a section of the public some anxiety. In the paper read by Mr. M. Macartney, surveyor to St. Paul's, before the Royal Institute of British Architects, he gives a clear and exhaustive report upon the present condition of the cathedral. This important building (Wren's masterpiece) is erected upon a clay soil, which accounts for the south side "moving outwards." This is the same cause in the west front. St. Paul's stands on Ludgate Hill with a considerable fall on the west to Ludgate Circus, where in the olden days the Fleet river entered the Thames. The southern elevation faces the river Thames, where there is also a considerable fall. The sinking of the timber dome is, in my opinion, on account of the enormous weight of this structure with its lead covering. In comparing the building of St. Paul's with some of the cathedrals on the Continent, how is it that these continental cathedrals, most of which were erected hundreds of years before the present St. Paul's, show no weakness in their domes and cuttings and arches? I have had the opportunity of examining, amongst others, the roof of the cathedral at Limburg on the Lahn, Germany, where I observed that the centres of domes, arches and vaults were constructed out of a concrete made with "Bim sand," a volcanic production found in large quantities near the river Rhine. This "Bim sand" (pumice), combined with a good cement such as Portland, makes an exceedingly strong, light and fireproof material, and is most suitable for this kind of construction. If the dome of St. Paul's had been constructed with this kind of material no sinking of the structure could have possibly taken place. The present dome of St. Paul's is constructed of great timbers, now nearly 250 years old. These are covered with lead, and the dome at its base is held together by a great iron chain ring. Would it not be possible to reconstruct this, the most graceful dome in the world, in the above-mentioned materials, and thus relieve the walls and foundations of the enormous weight which the base has to bear? The damaged foundations, of course, would be underpinned. I trust that the saving of this, the most important building in the City of London, will be taken into serious consideration before more damage is done or it is too late.—I am, sir, your obedient servant,

HENRY H. B. SANG,  
 Architecte-Décorateur.

## Egyptian Doggerel.

SIR,—May I be permitted to express my admiration of Mr. Robert Williams's perspicacity? for it is a curious fact that, after preparing for my bath recently, I mislaid my slippers. I wish Mr. Williams would send me over his office boy to find them, as I feel very cold and uncomfortable. The young dog would be better employed in looking for my slippers than in writing sorry doggerel. But perhaps it is only Mr. Williams's humour, and the lines may be really his own production, in which case I should

grieve to animadvert upon them. "Ex Nilo nihil fit" be the explanation, and his office boy will translate "What comes from the Nile is fit for nothing."

I trust Mr. Williams will be reconciled to my retention of my anonymity. When the office boy entered my service (through your convenient by-the-by), he can write and tell his former employer identity of, sir, your obedient servant,

THE CLEAN BUT UNSLIPPED PANT.

November 18.

## GENERAL.

His Majesty the King has subscribed 250*l.* towards restoration of Winchester Cathedral.

A Fresco has been discovered at Newton Regis, Cambridgeshire, which is undergoing restoration. The subject is the "Last Judgment," and it is believed to be 500 years old. It was hoped to preserve the painting, but it is feared that this will be impossible.

Mr. James Alkin Paskin, civil engineer, late water engineer for the Halifax Corporation, died at Lytham on Saturday at the age of sixty-six. Mr. Paskin, who was born in London, began his career in the office of Mr. Bateman, C.E., F.R.S. He subsequently became works engineer to the Halifax Corporation, and was associated with all their big undertakings of the last twenty years. He successfully carried through the various schemes, including the Castle Carr, Widdow's, and the newly-opened Walshaw Dean schemes, which, combined, bring up the district water-supply to about 6,000,000 gallons per day.

The Battersea Borough Council have agreed to the proposals of the highways committee of the London County Council with reference to the electrification of the tramway from Nine Elms Lane to East Hill, and adopted the Council's suggestions in regard to procedure for acquisition of property. The borough surveyor was authorised to prepare estimates of the cost of widening works.

M. Cordonnier, of Lille, the architect of the Palais de la Paix at the Hague, has been successful in the competition for the new theatre at Lille. M. Dehaut obtained only 10 votes, less from the jury.

Amongst Other Interesting discoveries made at Winchester Cathedral works are a series of "marks," made by the old "stone squarers" and carvers, to indicate their work. The marks in several cases indicate the cross, with variations, and the ages range from Norman times down through the 13th and 14th centuries. Mr. F. Messrs. Thompson's manager, has taken sketches of them.

The London County Council decided on the 19th inst. that a large majority, that, with a view to decreasing the amount of non-employment in this country, it be an instruction to all committees authorising the purchase of manufactured articles to show preference, wherever possible, to goods wholly or in part manufactured in the United Kingdom.

The Church of St. Giles, Colchester, which is the burial place of the two Royalist knights, Lucas and Lisle, slain by General Fairfax after the siege of Colchester, is now undergoing restoration. While an old oak chest in the vestry was being examined this week there was found in it a purple altar cloth bearing the insignia of the Lucas family and the date 1617. The cloth had evidently once draped the altar in the Lord Lucas chapel on the south side of the church, and had probably been hidden under a pile of documents in the oak chest to escape the attention of the Roundheads.

Ayr Academy has just been enlarged by the addition of a new art school, the building and equipping of which has cost over 8,000*l.* The structure, which was designed by Mr. J. A. Morris, architect, Ayr, is separate and to the north of the main building. The new school is of three storeys, including an underground floor which contains the heating apparatus, &c. The first floor is mainly occupied by a technical workshop, and an architectural building construction and mechanical drawing lecture room. On the second floor there is a studio 45 feet by 45 feet, in which is being taught the whole of the elementary art drawing of the Academy. On the same floor there is also a large modelling-room. On the top floor there is another small life-studio, and a painting gallery abutting on the modelling-room. All the rooms have lofty ceilings and are elaborately heated and ventilated. Nearly the whole of the north side of the building is glassed and artificial light is supplied by the electric light.

## THE WEEK.

ect of the Methodist Church House on the Aquarium at Westminster has been so long, it seems rather late for the authorities of the Westminster Hospital to discover that the new may cause inconvenience. The principal will be to Prince's Street, and the tower be about 20 feet from the hospital. Sir L. BARRY has called the attention of the City Council to the subject. He contemplates the Council should acquire sufficient power to allow of the widening of the thoroughfare. The tendency of traffic is not, however, to pass Prince's Street. It appears that the improvements considered the matter last year, but the Westminster Methodist Church intimated that if they desired to acquire the necessary land for the extension they would have to do so under compulsion. The committee, regarding the cost of acquiring land as prohibitive, did not feel suggesting action in the matter, and they are of the same opinion. The hospital treasury is a small one, and if litigation became necessary it would be difficult to see how it could be carried on. The position is a difficult one, and without any breach of the law it has been occupied after the failure of the extension with a building that would be more embarrassing to the inmates of the hospital than the present Church House.

Changes which have taken place in the ecclesiastical affairs of Scotland will have an important bearing on the arrangements concerning churches and chapels. At the meeting of the United Free Church of Scotland which was held last week it was stated that the General Assembly had failed to secure joint accommodation for the two Churches in certain buildings. It was a serious alternative before the Commission either was to provide churches for dispossessed members or to allow them to join other communions. It was considered that the erection of forty-three stone churches or halls and chapels would have to be erected as soon as possible. The minimum expenditure was estimated at £1,000,000. It was agreed that the adoption of a standard plan for churches was a mistake. The instructions had been given, and committees were to be allowed to employ the services of local architects in certain cases.

Sanatoria are found to be effectual in overcoming diseases—and there can be no doubt on this point—the friendly societies should certainly erect one or more for the benefit of their members. They possess large sums of money, a part of which with advantage be applied to the erection of sanatoria. It has been shown by Dr. F. E. Littlehampton, that from consumption alone over 100,000 members of friendly societies are lost every year. In all the sanatoria in the kingdom are means of the labouring classes. A sanatorium can be built for 70,000l. or 80,000l. Three patients could be treated at a time, and their treatment would average three months, which only mean about 1,000 cases per annum dealt with. Two-thirds of these could be cured, which meant 700 to 800 members being restored to the ranks of the labouring classes again, instead of being a drain on the resources of the societies. Now eight hundred draw the rate of 12s. per week. The institution of a sanatorium, would mean that something like 400l. could be saved in sick pay. By a levy of 4d.

from each member of a friendly society the money could be obtained in a year to build the sanatorium, and a further levy of 1½d. per member per annum would cover the whole expenses of upkeep, as well as paying the sick pay to the families of those under treatment. If the friendly societies did not soon take this matter in hand, the State would have to step in, for the disease was gaining rapid strides. Another advantage of action on the part of friendly societies would be the encouragement of self-reliance. The danger is allowed to grow while men are waiting for benevolent persons to exercise their influence in gaining admission for them into existing establishments. In sanatoria founded by friendly societies members would feel they had a right to treatment and were not objects of charity.

IN 1891 Mr. ADRIAN JONES exhibited a small model of a quadriga at the Royal Academy. After sixteen years there is now a possibility that the work will be carried out on a large scale. Quadrigas are generally supposed to be memorials of war, but in this case Peace appears to be driven by a boy who controls the steeds. A figure of a lion suggested it was a national symbol. Lord MICHELHAM has proposed to have the quadriga executed in order that it may be placed on the archway at Constitution Hill. It will be remembered that originally the arch faced Apsley House and was used to support the equestrian statue of WELLINGTON by WYATT, which has been more often caricatured than any sculptor's work, ancient or modern. The alterations in that part of Piccadilly made it necessary that the arch should be removed. WELLINGTON and his charger were exiled to Aldershot and the arch was placed in its present position. The arch always appeared to be in the way, and it cannot be said that it is at present in a right position. It is to be hoped, however, that when Mr. ADRIAN JONES's quadriga surmounts it the appearance will be improved.

THE name Aylesford is sufficient evidence that the river Medway could be forded in its neighbourhood. The Romans may have erected a bridge to allow of traffic when there were floods, and some of the old masonry may be incorporated in the existing structure. The history of the bridge is uncertain, but everyone who sees it must admit that it is very ancient. The conditions of modern traffic are not always met by arrangements which served in Mediæval times. In consequence, old bridges are from time to time demolished and substitutes found which have wider roadways and waterways. During several years the traders of Aylesford have come to the conclusion that the old bridge has existed too long. They wish to have it removed. The first question in such a case is whether removal is essential; and the next is, who are to pay for the construction of a new one. It appears that a navigation company, by an Act obtained in 1862, possess the power to take down and rebuild Aylesford bridge or to alter and enlarge any of the arches. Although the company may therefore claim the bridge as their property to some extent, they have not attempted reconstruction. They were, perhaps, acting prudently in their own interests, for if the bridge was to cost some 10,000l., it would not follow that an increased revenue would be obtained through the passage of boats, barges and other vessels. Their inaction may be taken to prove that the bridge is not an obstacle to navigation. The County Council is therefore justified in concluding that as their authority is mainly concerned with the roadway, they would not be justified in becoming responsible for the outlay on a new bridge. The subject was discussed at the last meeting of the Kent County Council, and, as was to be expected, antiquity triumphed. It is rarely such a victory is gained.

### CONTRACTORS AND MUNICIPAL AUTHORITIES.

THE town of Maesteg in Glamorganshire contains about fifteen thousand inhabitants, and with all respect for them we must say it is not remarkable historically or commercially. But the town is certain of remembrance, especially in treatises on the law of contracts. It has been said that the people are happy who have no annals, and it would be better for the present inhabitants of Maesteg if they were not involved in a law suit which has been on and off for a whole month in the Official Referee's Court. But they are entitled to the credit of a clearer definition of the rights of municipal authorities in dealing with contractors. Considering the ease with which a second National Debt is being incurred by the operations of corporations, urban councils and local boards that is an important matter. If it has been discovered that elected authorities in the eyes of the law are not much unlike private individuals when they deal with contractors, that also is worth knowing. Maesteg, therefore, may be considered as an instructor, although it will have to pay dearly for assuming the office.

A few years ago the population of Maesteg was under ten thousand. But as coal mines were opened there was a vast addition to the population from other parts of Wales. It was therefore necessary to provide for an increased water supply. From the geographical position of Maesteg it did not seem a difficult undertaking, for the main requirement was to construct a dam of puddle and concrete, by which the water running down the hills would be impounded. Plans were prepared, the Public Health Act was put into operation, a Local Government Board inquiry was held, and the contract was let to Messrs. JONES & SON, of Neath. The amount was about 30,000*l.*, but it was anticipated that eventually the contract would work out to about 60,000*l.*

The operations were commenced without much delay, and proceeded until Messrs. JONES had received 21,838*l.* Then doubts arose concerning the possibility of finishing the work, except at a price which would largely exceed 30,000*l.* The design was considered to be unsuitable. Mr. R. E. MIDDLETON, an engineer of experience, was called in by the Council and advised them to abandon the works, as he had misgivings as to whether the reservoir could become sufficiently watertight. The Council accordingly concluded they were warranted to order the contractors to discontinue operations. The work done was measured up by Mr. MIDDLETON's orders and was valued at 18,986*l.* 7*s.* 2*d.*

The plaintiffs had not undertaken to make the reservoir watertight, and it could not be said there was any unfavourable allegation concerning the manner they carried out the contract. When they received notice to discontinue they replied by saying there was no justification of the Council's action, and that they would have to be paid a large sum as compensation for outlay on plant and materials and for the loss of profit which would be derived from the completion of the works. Some contractors would have taken the Urban District Council of Maesteg at their word and would have removed all their property from the ground. But Messrs. JONES realised that if the timbering of a large trench were taken away the surrounding earth would have fallen in, and Maesteg would suffer by the obstacle to the water supply. As the Council would make no concession Messrs. JONES brought their action to recover damages amounting to about 40,000*l.* Owing to the extent of the details which had to be taken into account the case came before Mr. MUIR MACKENZIE as official referee.

It is not necessary for us to consider the arguments at any length. Evidence was given on both sides by engineers of experience. Those who appeared in support of the plaintiffs testified that the original project on which the contract was based was practicable;

the site selected for the reservoir was sufficient and when puddled the trench would be so. The engineers who appeared for the defendants considered that the ground had been disturbed by geological forces, that the water could easily escape by fissures and that in a dry summer the reservoir would be empty. One engineer expressed the opinion that a mixture of concrete and puddle was not a safe basis for such work, and the expense of securing a watertight bed might extend to 75,000*l.*, or even more. Differences of opinion appear to be common in connection with water-works. Even when the strata are rocky it can be supposed that sooner or later they will sink or rise, and walls of masonry or concrete are liable to cracks and leakage.

The legal points raised by the Urban Council were more important. In the first place, the Council was unable to rely on the absence of sealing. The Public Health Act of 1855 states that every contract made by an urban authority, when the amount exceeds 100*l.*, must bear the common seal. Even if the contract had been executed and the Corporation have been benefited from them the rule applies. It has been held that in such cases the urban authority need not observe the absence of a sealed contract. Human nature, however, is too weak to neglect so potent a warning, and it was produced in the Maesteg case. But it was mentioned that no value appears to have been placed on the plea by the counsel for the plaintiffs' official referee. It was also contended that by the contract the Urban Council could order the contractors not to execute any portion of the work, and the reliance was placed on that point as if it signified a suspension of all the works. The procedure under the Public Health Act was said to be beyond the financial powers of the Council. The Council considered the dam might be possible, but if the work was not completed there was no money available to pay the contractor.

The learned official referee came to the conclusion that the contracts had been legally executed, and the Council must therefore be considered as being bound, unless the transaction took place with ordinary individuals. The Council's contention that a watertight reservoir could not be constructed on the site unless a different design was adopted and additional expense incurred was set aside. There was nothing conditional in the contract about the payment being subject to the raising of the money required. The American case *CLARK v. Mayor of New York* was relied on, and it was laid down:—"Where one party agrees to construct an embankment for a certain sum per cubic yard, such place as he shall be directed by another party to place selected is such that there is a natural foundation while the embankment is built, and a consequent waste and shrinkage of the earth, any system of measurement which does not take into account the embankment which supplies the place of the soil is not a correct one." The Council's theory, inasmuch as nothing was said about payment being subject to an increase in the depth of the excavation, was held to be a liability.

The Council also seemed to think that after giving notice to the contractors to cease working, they afterwards be held as failing to carry out the contract. But the official referee relied on the decision in *DAVIES v. Mayor of Swansea*, and others, and of his conclusion that a contractor is not responsible if he is not allowed to complete his work on the conditions.

The amount of payment to be awarded for the work could be calculated after measurement, and contract prices. As respects unfinished work, the estimate of expense incurred and of ultimate profit would be more or less conjectural. After careful consideration the referee came to the conclusion that Messrs. JONES should have judgment for 17,909*l.* 3*s.* 7*d.*, with

lently the Maesteg authorities brought all the upon the town through erroneous ideas about and liability. An Urban Council is expected ide for the preservation of the health of the to the extent prescribed in certain Acts. For purpose money can be borrowed if authority given. The work required can be carried out in and different contractors may be employed. A or who tenders is not obliged to understand the adopted, nor to inquire why, as in Maesteg, a ounting to 30,000*l.* was let when the ultimate would probably rise to double that sum. The value of Maesteg is very limited, and as reports read about failures of costly embankments in irts of the country and the bursting of reservoirs Continent, the Council may have concluded they olved themselves and the town in responsibilities ere too onerous for their means. In so good a ey might assume they would gain official pro- The strange judgment given in THORN v. tion of London" thirty years ago was relied on sel for defendants to sustain the argument that ractor undertakes risky work without an express t he must accept the consequences. ### SOME STATELY HOMES.\*

ATEVER may be the advantages of Socialism, we cannot suppose it will ever lead to the of residences which will compare with the old s of the English nobility and gentry. Upholders ialistic theory would no doubt look upon them alies and would contrast them with the inferior s of other classes of society. It is not our to discuss the principle by which the wealth of try was at one time confined to a comparatively lies, who were liberal in expending a large part ings. We can only accept things as they once e. We maintain, therefore, that when all things mmon there is no more possibility of having uses like those of the Tudor and subsequent than of having temples for Positivists and nists which will surpass Mediæval cathed- There may hereafter be sumptuous build- general use, although the supposition is not a past or present experience. But what are s the stately homes of England owe their individuality, and when that power is super- ere is an end to costly mansions. As we er tell when a change will take place, and the great houses may become, like Aston Hall, useums, it is well to study them whenever we ortunities or as they are presented to us in HAM's fine photographs.

ne way they appear to us in the volume of n Homes" as if they were deserted or had

English Homes. The internal character, furniture and ts of some of the most notable houses of England, pic- icted from photographs specially taken by Charles Vol. II. The letterpress edited by and an introduction y H. Avray Tipping, M.A. (London: Country Life and s, Ltd. New York: G. Scribner Sons.)

become mere spectacles. There is nothing to suggest they are inhabited. When JOSEPH NASH brought out his "Mansions of England in the Olden Time" he took care to introduce figures arrayed in the costume which corresponded with the architecture. They expressed the great fact that architecture was made for man, while they served to indicate scale and suggested purpose. If the present owners of those historic houses were introduced in modern costume it must be allowed they would not be in keeping with the surroundings. It was then right to forego the use of such aids. But while contemplating the photographs we cannot avoid emotion like that of TOM MOORE when he said:—

I feel like one who treads alone  
Some banquet-hall deserted,  
Whose lights are fled, whose garlands dead,  
And all but he departed.

The apparent silence of the show-places seems more marked when so much of the history of the possessors of the house is revealed by paintings and other objects. Staid barons, gay and gartered earls, countesses mature in robes and pearls, judges in formidable ermine, bishops who had not left a single sermon, generals in armour or in wigs of MARLBOROUGH's martial folds, NIMRODS, whose canvas could scarce contain the steed, to adopt BYRON's classification, which has its truth, appear to regard the desolate rooms. Then in some houses, like Adlington Hall, there are innumerable armorial bearings suggestive of the family and its alliances. Shields, breastplates and early muskets recall that England was not always in a peaceful state, while foreign paintings and sculpture remind us of the time when English gentlemen enriched many continental dealers. Everything recalls times of action.

The influence of history in imparting character to English mansions is well suggested by the views of Marsh Court, Hampshire, which comes last in the volume. It was erected by Mr. LUTYENS, and is a most interesting example of a modern building in which the characteristics of the Tudor period are treated in an independent manner. As a specimen of architecture it surpasses many of those of older date. But there is no affectation of the antique. The chairs and tables, if in old style, are plainly of modern manufacture; the portraits are few and small, and there is a general absence of anything which might represent heirlooms. All the rooms are elegant and refined. The billiard-table is a work of art. But the perfection of the interior and the absence of everything which could be considered incongruous separates the mansion from its companions. It is not improbable that in some of the other houses dealers could tell queer stories about the portraits, furniture and "antiques." But somehow, whether genuine or not, they appear to be necessary in order to carry out the characteristics of an old English home. Even the images which are used for the furnishing of the chapels, and which do not date from pre-Reformation times, can only be taken as substitutes for those which at one time would have existed. Marsh Court stands for truth, and more or less coldness therefore belongs to it. The other buildings have poetry about them, much of which may be fiction, but which still can afford pleasure to weak mortals.

About fifty mansions are introduced, and most of them represent sixteenth and seventeenth-century work. The first is Ightham Moat, which is familiar to most students of English architecture. Part of it dates from the fourteenth century. But much was altered in subsequent years. Another ancient house is Maxstoke Castle. St. Donat's Castle is remarkable as being a fifteenth-century fortified house. Holland House still survives, although the encroachments on the Park impart more truth to MACAULAY's words when he said, "the time is coming when, perhaps, a few old men, the last survivors of our generation, will

in vain seek, amidst new streets and squares and railway stations, for the site of that dwelling which was in their youth the favourite resort of wits and beauties, of painters and poets, of scholars, philosophers and statesmen." Although it is now generally associated with the Fox family, they were not connected with Holland House until 1749, when HENRY FOX obtained a lease of the fine property at a rent of 182*l.* 16*s.* 9*d.* The house was built early in the seventeenth century by Sir WALTER COPE, who was one of the officials of JAMES I. Another mansion which now has a peculiar interest is Welbeck Abbey. The older part belongs to the time of Sir CHARLES CAVENDISH, who, in the early part of the reign of JAMES I. utilised the old abbey for a new mansion. Then it passed to the family of BENTINCK, who was a loyal factotum of WILLIAM III. But it has been many times altered and is a medley of styles. The Dutch spirit is, however, manifest within it, for it abounds with paintings, furniture and objects of different kinds, although pottery, which is generally so attractive in Holland, is not in excess. The great ball-room, which was used last week, might be considered a picture gallery, for the walls are hung with full-length portraits.

This second volume is a fitting companion to the first. The two of them are well adapted for table-books and can afford pleasure for hours in contrasting the examples. We hope the series is not complete, for the plates show what can be done by photography in providing accurate copies of the details of English architecture, not only in a way which no artist could surpass, but at a moderate cost. The descriptions of the buildings by Mr. AVRAY TIPPING increase the interest of the illustrations.

Residences of another kind are exemplified in the volume on "Flats, Urban Houses and Cottage Homes."\* To the pages a great many English, Scottish and foreign architects have contributed examples. Mr. VERITY deals with "designing," Mr. E. T. HALL writes mainly on the foreign flats, and Mr. G. C. HORSLEY on urban houses and cottage homes; while the Editor treats the subject from a flat dweller's point of view. Not only are exterior views given (sometimes in colour) and plans, but interiors have been photographed as they are, and in that way those who have no particular ideas of their own about decorations and furniture will find many suggestions. The volume has therefore all the elements for success in its timeliness, and it is rarely so much value is offered for the small sum of five shillings. Mr. VERITY, whose block of flats in Hyde Park Place has been reproduced in *La Construction Moderne* this week, concludes his introductory notes by saying:—

All dwellers in flats will admit that the expense of service and maintenance, with the annual expenditure necessary for repairs, are much less than in a house having similar facilities for entertaining. There are also staircases, so that the cost of furnishing and upkeep is considerably reduced. The *flat-de-luxe* has long been a great success on the Continent, and here in London, no doubt, more buildings of this description will be erected year by year. Not only do they possess all the comforts to which the wealthy are accustomed; in addition to that, they need fewer servants than are necessary in large houses, and it is easy to lock up a flat and leave it in charge of the manager. When considered also from an architect's point of view, the designing of mansion flats offers great opportunities both for planning and artistic treatment—opportunities, perhaps, even greater than those which present themselves in the building of a town mansion.

A volume which can serve as a supplement to the preceding is "The House Beautiful and Useful. Being Practical Suggestions on Furnishing and Decoration." By J. H. ELDER-DUNCAN (London: CASSELL & Co.)

\* *Flats, Urban Houses and Cottage Homes.* The text by Frank T. Verity, Edwin T. Hall, Gerald C. Horsley and W. Shaw Sparrow, Editor. (London: Hodder & Stoughton.)

For young housekeepers who aspire to have a tation for modernity the book is a true guide. It is not produced in the interests of any manufacturer, although the contents of many of the London furnishers have been carefully studied. The examples selected are in an accepted style, and several of them if found together could not be considered as clashing. Wall-papers and carpets are compared with the pages as well as articles of furniture. In many instances prices are given. It must not be supposed that in any way resembles an ordinary catalogue. Mr. ELDER-DUNCAN has taken care to avoid the character of such a production. His volume is a treatise on furniture that is fitting for use under varying conditions. If occasionally a name is mentioned the reader can be confident the praise has not been arranged on principles. The illustrations are nearly all from photographs and are therefore truthful.

### MURAL PAINTING.

AT a meeting of the Incorporated Institute of Decorators held on Monday evening last at Hall, Trinity Lane, E.C., Sir W. B. Richmond, R.A., D.C.L., explained his method of mural painting. The president, Mr. J. D. Crace, occupied the chair.

Sir WILLIAM RICHMOND said that before his time he was pointedly practical he would like to take the subject with him on a little excursion into an age which was ancient history, but it was a history so intimate with the subject upon which he was to address them that they might call it almost a history of their own time. There is an old saying, which he believed to be perfectly true, that knowledge was of any value until it had been forgotten. That, of course, showed the enormous value of tradition. They happened to live in, he would not say an age, he called it a decade of experiments, when many old truths which had made the world what it was were apt to be lost sight of. Much scholarship, much work, much strenuous labour of thousands of years possibly be lost in ten years of superficial value. The loss of tradition was so enormous that if it were to be suddenly from them they certainly would not go back to the Golden Age, but to the veriest age of savagery and the grossest forms of existence. They wished them to think back a moment; they would have to traverse thousands of years before they would find anything like the roots of those ancient traditions. They could go back and find them in Crete 4,500 years before the Christian era. They would find them in Egypt, Greece, and later on they would find them in Phoenicia, then in Rome and Italy, and still later on they would find the same traditions in England. Surely that being the case would be bad luck if they were to cut the thread of the chain between the present day and the experience of 5,000 years ago. As a preface to his remarks, he must make an anachronism. Whatever he knew of mural painting was not a discovery in the very slightest; it was all of it known 3,500 years ago. They were things known to the ancients, and they were all of them truisms, and he thought they were truisms to-day. He asked to be allowed to picture for them what the old artistic education was like.

They must imagine they were in Florence in the fifteenth century. It was early morning near the Duomo, and they would see troops of young men going towards the workshop or shop—it was not called studio in those days—where the men were apprenticed to learn their business, and where painting was a business—it was a craft. They would see the students a middle-aged man and little boys. They would watch them enter into the shop they would see the master, or headman, if he was there, and in all probability he would be, because the Italians were an industrious people and the *maestro* would welcome the older pupil as if he were a little boy. The youngest pupil would promptly sweep the shop, after which he would be told to clean well the palettes, vessels and brushes; thus he was taught first tidiness and neatness. Then the various grades of pupils would be given their appointed work, the less advanced would be tracing of the master's work and so on. The more instructed and advanced pupils would then gather round the *maestro* himself, and in watching him at work they would learn from him the beauty and subtlety of forms. The

in those great days was a trade, a craft made as the carpenter was taught to make boxes. If it had later on that the pupil became master, or showed developed distinctive talent, he had legs to stand on, he understood the very grammar of his art—from the shop, grinding the colours and putting on and above all he had learned to draw well. It was the kind of education which they missed nowadays, when every young student wished to jump into fame before he had strided over a ditch, to make a splash before he had time to aspire before he could draw. Those matters which required investigation. Therefore, those who had visited Italy, and those of the audience who had not, but were acquainted with the great works by Giotto, Gaddi, and others, would know that the masters, the great men who differentiated from the crowd, were very few—the very supreme and great. Through the grades and grades of pupils they finally came down to the man who, perhaps, had no genius, no invention of his own, but who was, nevertheless, a great master. That was what education ought to do. Nobody could create. No education or practice could make it, but education could supply the solid, well-grounded means to a man's power of expression and liberty, and it was that which was lacking in education. For the benefit of those who were not personally acquainted with his subject, the lecturer was allowed to give an instance of pupilage. He would not restrict the subject to the great masters in art, but they might go nearer to our own time, that he hoped to substantiate his argument. Raphael copied his master Perugino, but so sensitive was he that, notwithstanding the extremely close resemblance, Raphael's early work bears to his master's, as a difference. There was seen in it a spontaneity and a depth of feeling that was not in the master's work. The great Michelangelo also showed the master's influence in his works, when they looked at the beautiful things he did the Michelangelo was so strong that it overruled even the influence of such a sworn friend as Perugino. Again, Sir Joshua Reynolds under Hudson. Young Hudson was what did he do but learn his trade? Hudson was an excellent portrait-painter. He knew his business, he knew that it was a bad thing to put white over white. He knew all those facts, and Reynolds, his pupil, an intelligent fellow, used them. Reynolds's pictures were very like Hudson's; but the lecturer thought he had to use his free manner in painting through the training he had under his master. Therefore, Sir William Richmond began his opening remarks by saying that no knowledge was worth anything until it had been communicated. He regarded the meeting that evening as a little discussion among themselves than a didactic lecture, for his purpose was only to tell of his method in mural painting was not at all of his own. It was what all the old tempera

did. If all they had to make up their minds in such a form of decoration that they would work directly on a wall. Wall-painting, no matter how arduous a task; by that he meant to painting directly upon the wall. They must be quick, sharp and sure; and they must not be surprised if the result was different to anything they ever saw in their studio. They must be prepared that if the picture they had painted upon the wall were removed out of the position in which it was first exposed, that it would in all probability look utterly ridiculous. First, then, the lecturer would apprehend that they were all agreed that the picture must be seen upon the wall, and then he thought the picture was to put that design which the mind had conceived very swiftly upon paper. They should do this so that the visual impression, which only lasted a very little time, was indelibly sealed, and then he urged them to leave the drawing alone and not to alter it. After the lapse of a few days, he suggested they should look at the picture not to make alterations. They should then put a tracing paper over their design, and trace it down the hard line, leaving the tracing paper over it if they wished to make any alterations, but adhering faithfully to the first sketch. The method of tracing over the first sketch in some sense weakens the first impression, but the lecturer told them not to be dismayed at this because they would be always adding some-

thing; they were adding experience, whereas, if they altered the visual impression on paper, they had nothing, and it was his experience that in ninety-nine cases out of every hundred he found the first impression was always the best and they would always go back to it. They would remember the advice of a master, "Never destroy first lines; first lines were the voice of God." It was that which they were hot on that they must do, that and none other.

While they were young and inexperienced, and in fact until they were scholars, they would be perfectly right in making full sized cartoons for all work. He urged them to draw well, hard, sharp, fine, banal if they liked. This last term he understood was the word used to express good drawing. The young student was apt to think himself uncommonly clever; when he got older he began to find he ought to have worked harder, and when he got to be as old a man as he, Sir William Richmond, he would only wish he had drawn a great deal more in hard lead pencil and less in charcoal. Therefore he would tell them to make their drawings as hard as they could and not to mind finding their early attempts laughed at. They should not mind being told they were working like students so long as they drew well, and yet they were not to allow themselves to be flattered into thinking they were geniuses when they had not finished lapping their mother's milk. The drawing on the cartoon made, they still had trouble before them. They had to pounce the design on the wall, and he would tell them that that division of the work was done in the Italian bottega by little boys of twelve and thirteen, and it had now to be done by youths of twenty years. Then they must be clean in their work or the surface of the wall would be spoiled, and when they had drawn the design in charcoal they would afterwards rub it out, and finally they would have to show beautiful drawing on the wall, perfectly done, hands, feet, drapery, everything ready for the application of the colour. Everything drawn upon the wall was inside, and they must realise that. The process of the drawing of it they had learned from the distance of one thing from another, in point of fact they had got the perspective. Then came the great test. How were they to establish the tone of colour? This should be governed by the amount of light that would fall upon their painting, just as they established the tone of all objects seen in the street by the tone of the sky. Then they came to the treatment of the furthest distance, from which they would come up gradually to the figures. These would be painted last, observing the relative tones of the picture, and suggesting the figures by the most subtle enrichment, but remembering that strength did not rest in violent contrasts, but in delicacy of relations. Thus, said Sir William, they had the whole environment of their picture, the sun, the sky, the shade, so that they could feel they were not standing against a flat wall but in the middle of a semicircle, as if they were actually among the figures represented. That was so if they realised, and the artist must realise it if he was to paint a great work of art. The artist must realise that it was not a wall which was before him, but that he was inside the scene represented and among all the people gathered there. Thus it was that the more the artist realised that he was the centre of an entire circle, the more truthful in tone and colour would be his picture.

Sir William Richmond then explained a diagram of colours in weak tones, but in his arrangement of them they became practically all of the same tone value. He cautioned the students against putting their tones in the wrong places.

Speaking of the best medium for tempera painting, the lecturer said milk was the best spreader of colour, and it was undoubtedly used by the Latins in their mural work, and an Assisi painter had told him to use curdled milk. There were two ways of painting in tempera, said Sir William, as there are in most things. The word tempera, as often used, was a very ridiculous term. All vehicles that were mixed with powdered colour were tempera, so that it was misleading to talk about temperas. Oil tempera had often been tried upon walls, but he knew of no single instance in which it had been successful. Of course, the great failure in that medium was the "Last Supper" of Leonardo da Vinci. In more modern painting in England and elsewhere they could also point to work that had suffered. Then there was a difference in temperas; whereas the oil tempera made the colour work unpleasant and dirty the other temperas had a sense of subtlety and freshness. If on their various visits to English towns or English cathedral cities they would look at the attempts which had been made to revivify old work,

they would at once appreciate the difference in temperas—the old paintings full of life and charm, and the modern work hard and unpleasant. He wished to say a word about the dark and light ground, and they must go to Pompeii for examples. In some of the recently discovered series of paintings there were lots of little dancing figures painted upon a black ground. They really were painted on black, but not in oil, in wax. Where the figures had been painted on a white ground they found an entire difference in the colour. Thus the result of the painting the artist wished to make was dependent upon the ground, so that if he wished to paint a tremendously strong bit of local colour he would paint on a black ground, and if a light and airy subject on a white ground. Velasquez had an amazing sense of decorative treatment, and they would find all through his great work an automatic harmony in all colour. If his sepia was grey, his red was also grey, his black was also grey, the whole conception was always one amazing harmony. Therefore, said Sir William, it would seem that they would be extraordinarily safe in taking two schemes of that kind as their starting-point, whether they worked on a white or black ground, and arrive at harmony. Thus they would have a great reserve. Sir William counselled them to always reserve their darks for the last, for even then, if they did not wish their painting to appear black, they could put in a little white. Therefore, whatever was their work as decorators, their scheme of colour would be light, but they must beware of the spot. They should be quite certain that the scheme of colour, whether it was dark or light, was without spots, and then it would not look weak. They must not be misguided and imagine that because a thing did not look black or white on the wall it was weak, or because it was not vermilion or blue it was weak. The strength of the painting would rest in the perfect gradation of colour.

Mr. J. D. CRACE said he wished to make one or two remarks, and also to invite the meeting to express their thanks to Sir William Richmond for his interesting lecture. Sir William had alluded to apprenticeship, and said it was the groundwork of the great success of the men who practised in early times. In the pages of Cennini, as well as in other works, reference was often made to apprenticeship. Cennini mentioned incidentally the curious fact that he was himself apprenticed, and for the term of twelve years—three years in learning to draw, three years in learning colours and after that six years in painting. It was therefore remarkable that, going back a great deal further in history, they found that Apelles himself was apprenticed for twelve years, and his master taking apprentices with a premium of 200*l*. Twelve years was considered a reasonable time in which to learn one's work, whereas at the present time he believed six months in a school was considered to be sufficient.

Mr. FRANK MURRAY asked whether egg tempera exposed to the atmosphere of London would last twelve years, and Sir William Richmond, replying to the question, assured him that it would last even a longer period.

Prof. FORMILLI seconded the vote of thanks proposed by the President and the meeting terminated.

#### THE GLASGOW SCHOOL.

"TO see ourselves as others see us" was considered desirable by Robert Burns. For that reason it is interesting to read the following account of the origin and characteristics of the Glasgow School of Painting, which the Inspector-General of Fine Arts in France—M. Armand Dayot—will include in his forthcoming work on "English Painting":—

It was amidst the business agitation of Glasgow and in its smoky atmosphere that the new Scottish school came into being and has flourished in so dazzling a manner. It should not be forgotten that the early efforts of this young school were as coldly received by the Royal Scottish Academy in Edinburgh as by the Royal Academy in London. It was the enlightened, although somewhat exclusive, patriotism of one of the wealthy merchants of Glasgow that not only encouraged the early manifestations of the young school, but which, involuntarily it may be, led to its appearance in the history of art.

About 1880 he brought over from France several examples of the Barbizon school, of which the masters, although appreciated by a few Scottish amateurs, were not much known to the majority of artists. The paintings, amidst which some specimens of Monticelli had glided, were eagerly admired by the young Glasgow painters, who

at the time were wearied of the official formulae, through the influence of some of Whistler's works. The novelties of the Japanese, had been dreaming of a reaction against the traditional academicalism as well as pre-Raphaelitism. They wished to combine with those who afterwards founded the International Society with the Munich secessionists, and with the artists and creators of the New English Art Club in London.

A few years later the Glasgow Corporation, in an academical opposition, purchased Whistler's portrait of Carlyle, which is one of the chefs-d'œuvre of the school. From that time the contemplation of the landscape of the French school, of Whistler's portrait and of the Japanese prints created an ardent love of truth, and resolved to employ in painting the richest and most varied resources of the palette. A sense of decorative effect was awakened in them, and their imagination, which had been paralysed by the doctrines of the school, was set free. It should, however, be mentioned that prior to the appearance of the works of Rousseau, of Dupré, of Monticelli, of Whistler, and of Hokusai, which had made so deep an impression on the Glasgow painters, MacGregor, Melville, Paterson, Guthrie, Lavery, and Taggart, the silent lessons of the great Raeburn had been religiously respected.

One name dominates the modern Scottish school of painting, that of W. J. MacGregor. It can be said with truth that he was the real founder of the Glasgow school. He it was who, after passing through the ranks of the Scottish painters James Docharty and James Greenless, and then that of Legros at the Slade School in London (where he made a most advantageous study), returned to Glasgow as a prophet, and as such he gave an example of his works as by his enthusiastic utterance he revolutionised the esthetics of his young compatriots. At once grouped themselves around him as their leader, and taught them that painting should become synthesis; the part assigned to decorative invention should be essential, and that care should be taken to avoid being lost in the infinity of details; they were to strive after a harmony of tones with which nature adorns itself, and the pencil should generalise the forms, and so on. This was in opposition to the Ruskinian doctrines of the pre-Raphaelite catechism. His eloquence was at its height in the latest and most audacious expressions of painting, long as his health permitted he carried out his work, and most conscientiously studied his subjects from nature, expressing in rich and delicate harmony landscapes, seascapes and rural subjects.

It was also MacGregor who, by exhibiting at the New English Art Club, was the first to form a bond between the independent painters of Scotland and England. His ardent and generous propaganda he moreover contributed to the extension of that revolutionary activity of which the effect is seen in all the artistic circles in Great Britain, even on the walls of the Royal Academy. It is a phenomenon to find a pupil of the French Legros, a passionate admirer of the romantic school of France, to take up such a rebellion against the manner of art which had been accepted, and whose nationalism was so restrictive, even Watts himself preferred its icy academicalism to the French painting, of which he could never speak in other than disdainful terms. In art even more than in politics, the most disconcerting evolutions are the most sudden, and it is not necessary to play at prophesying about the international reaction which may succeed to the revolution coming by the Glasgow school. For the present we may turn our attention to the champions who are most prominent.

One of the characteristics of the new Scottish school is the sense of artistic fraternity which exists amongst its members. Notwithstanding the marked differences between the individual temperaments, almost all of them are united under the influence of Mr. MacGregor in an enthusiastic admiration for the French romantics, for Whistler, for the Japanese, for Velasquez and Frank Hals; and they combine in a generous and persistent protest against the conventional formulæ which are too often imposed. It may be added that this sort of freemasonry is seen in the meetings in MacGregor's studio, or at Brig o' Turk in the Highlands, which is a favourite sojourn for the artists in summer, at Kirkcudbright, and even at Paris, where the works of James Guthrie were formerly much admired, where those of John Lavery each year obtain a legal success. But their real "quartier" is Glasgow; and amidst the bustle and smoke of a great city under its soot and on the banks of the Clyde, which are more sombre than those of the Styx, that they are

parkling palettes and indulge in their dreams of glory. No members of the group—one might almost say of otherhood—who are most universally celebrated are Guthrie and John Lavery. It is permissible to assert the art of these two remarkable painters the general of the Scottish school is manifested, and they suggest influences to which it has been subjected as well as tendencies. In many ways the first name is attached to strong technique of the Dutch school. For in the number of his portraits Guthrie appears as the pupil of Hals, though as one who was born under the same Raeburn. Lavery allies himself rather to Velasquez, he admires through the subtleties of the Whistlerian tonies.

One of the most original and most interesting figures of the Glasgow school was Arthur Melville. Death carried off prematurely. After he had become emancipated from the influences of Meissonier, Gérôme and Fortuny, to whom he had subjected himself during his residence in France, he attained a distinctive manner of his own, but in it was possible to discern through the (sometimes disconcerting) originality of his temperament affinity with French impressionism pushed to an extreme, and Japanese caprice in its wildest expression. There can be found in him something of Seurat and Hokusai, but his paternal relations were dominated by an undoubted reality. The subjects preferred by Melville were derived from the East or from Spain, and his favourite manner to use them was in water-colour. He excelled in rendering movements of crowds under the blinding light of Africa, in pencil expressed by brilliant but detached strokes and sumptuous harmony, which was marvellously adapted to faithful impressions of bull-fights, for which precise graphic rendering seemed unsuited. The "fascinating" appears well-adapted to suggest the work of this unique painter. His water-colours from the time he made a vivid impression upon Brangwyn. When his voyages to Morocco and Spain he found himself in the shadows of the mountains of his native country, and there he painted some subjects taken from the life of Scotland. But he could not resist the influence of the East, and under his rapid pencil the green hills of Scotland assumed a burning tint, the shepherds were bronzed and everything was enveloped in an atmosphere of fire. Melville was by nature an Orientalist. Much to be regretted that no specimen of the work of this individual and interesting an artist has yet been seen in the Glasgow Gallery.

The name of Arthur Melville evokes that of another of a similar temperament—one who, although English, may be classed in the group of Glasgow painters with whom he was once closely associated, viz. Mr. Joseph Mall. He is undoubtedly one of the most original among contemporary artists. His art, like that of Melville, is partly derived from French impressionism, but especially from Japanese artists, from whom he has derived a firmness of drawing with the most capricious.

But his technique differs very sensibly from that of Melville, whose touches contrast singularly with the nervous line and instinctive and powerful strokes of Mall—a draughtsman of the highest class, whose graphic works recall the chefs-d'œuvre of Hokusai. Joseph Crawhall, in spite of his prodigious facility, produces little that never exhibits. M. Dayot says he has had the pleasure to see lately in Scotland examples of his water-colours, and he felt profoundly impressed by them.

Like Melville he loves water-colours, and he uses the reference Dutch paper of a sombre tint. His favourite subjects are sporting scenes, and he does not disdain the mobile, although he prefers horses as befits the son of an artist who could also handle the crayon. But his use of art is not limited by sporting exercises, for there is a manifestation of life which has escaped his observation, and he can express his impressions quickly and accurately. For animals he has no equal unless, perhaps, the Welsh artist, Bruno Liljefors, and he might become the most remote of caricaturists if he cared to be more generous in his humour. He only works when he is in the mood, and he does not allow his drawings to be seen, for he looks upon them for the most part simply as studies which are far from perfect.

Another artist is MacTaggart, whose art is analogous to that of Claude Monet. His vision is no less luminous, and his observation of nature is served by an excellence of technique and an astonishing facility of hand. His landscapes are conspicuous by their deep feeling. Another

personality among the artists is E. A. Hornel, whose technique owes much to the works of Monticelli, an artist who is well represented in the private collections of Glasgow and neighbourhood. It is to the Marseilles painter that Hornel owes his marvellous palette, which is adapted for painting the delightful decorations resembling dazzling textiles or painted mosaics which have caused so much surprise in the misty North. His aggressive manner is subdued whenever he paints Japanese subjects or represents children playing in fields sun-bathed. Hornel is an Australian, but he came to Scotland when young. He at once entered into an alliance with the local painters, and then, after having studied under Verlat in Antwerp, he went, in 1893, to Japan with his friend George Henry, whom he encountered in MacGregor's studio.

The difference between the temperaments of the two brilliant artists was displayed on their return from their Eastern voyage. While Hornel was attracted by the joyous aspects of life, and exhausted his palette in representing them, George Henry, an impeccable draughtsman and marvellous colourist, expressed the melancholy of his mind on canvases which were executed amidst the smoke and vapour of the manufactories or on the sombre and crowded quays of the Clyde, or in the Highland twilight where mystery appears to reign. His "Cinderella" is a masterpiece of imagination and colour. Henry, in collaboration with Hornel, produced a remarkable decorative painting, "The Druids," in which their respective qualities can be clearly seen without any injury to the general work. The place occupied by Henry in the ranks of the young school is very important. His realism appears to become more emphasised every day, and more lately he has produced portraits of a high class. In this new evolution his art suffers a little by the loss of subtlety and refinement, but it is compensated for by the gain in power and in penetration. He has won the admiration of the English during his residence of some years in London, and in spite of the revolutionary character of his art he has been elected an Associate of the Royal Academy—that is a sign of the times.

It is necessary in spite of the brevity of this study to suggest the history of the Scottish school in order to indicate its general character. The Scottish artists of the first period, Wilkie, Faed, Nicol, Nasmyth, Phillip and Scott Lauder lived in London, but if their original talent did not suffer under any English influence, none of them with the exception of Wilkie made any impression upon English artists. This is no less true of the pupils of Scott Lauder, including Pettie, Orchardson, Macbeth, Colin Hunter, David Murray and Graham, who also frequented London studios and occupied the first ranks of the Royal Academy but whose art, although personal, has never been able to penetrate within the bounds of English art.

At the present time, under the revolutionary impulse of Hornel, Henry, Melville and their associates, to whose efforts can be added those of the French impressionists, Manet, Claude Monet, Cecily, Renoir (whose works are beginning to be carried across the Channel), and added to which are the exhibitors at the New Art Club, an apparent movement is being manifested in the ranks of English painters, although they are still too subjected to cold academic conventions and pre-Raphaelite fictions. Their eyes are being opened to the pure light of art, to the great light of Heaven. The persistent efforts of the young school of Glasgow, with its passion for beautiful colours, has greatly contributed to this happy event.

#### MANCHESTER ART GALLERY.

AN exhibition of works by modern French painters, chiefly of the Barbizon and Impressionist groups, will be opened at the Manchester City Art Gallery during the second week in December, and will remain open for about six weeks. Among the painters represented will be Rousseau, Diaz, Dupré, Millet, Corot, Harpignies, Boudin, Moret, Manet, Pissarro, Carrière, D'Espagnat, Mauffra and Pointelin. Works by such English painters as Constable, Turner and Bonington will also be included, to illustrate the influence of English landscape art on landscape painting in France. Most of the pictures will be from the collections of M. Durand-Ruel and the late Mr. Staats Forbes.

Sir William Mather will deliver his presidential address to the Manchester University Education Society on "Education and Duty" in the Whitworth Hall on December 3.

## NOTES AND COMMENTS.

THE completion of Vauxhall Bridge has been taken as an opportunity by the highways committee of the London County Council to prepare a code of by-laws for the management and regulation of all the bridges which are under the control of the Council. The object is to prevent injury to any part of the structures and the mooring of boats or vessels to any part of them. But the most important part is that relating to the maximum load which will be allowed to be brought on each bridge. There is to be no limit to the weight on Battersea Bridge, Putney or Fulham Bridge, Vauxhall Bridge and Waterloo Bridge. A load of 15 tons will be allowed on Hammersmith Bridge and Westminster Bridge. The loads are limited to 5 tons on the Albert Bridge, the Chelsea or Victoria Bridge and Wandsworth Bridge. Only  $2\frac{1}{2}$  tons will be allowed on Lambeth Bridge. Among the county bridges, there need be no limit to the loads on Beckenham Lane Bridge, Lea Bridge, Lea Green Bridge, Seven Sisters Road Bridge, Plough Bridge and Wandle Bridge.

If the design of Professor W. H. BURR for the Heinrich Hudson Bridge at New York is realised it will demonstrate the strength of reinforced concrete under extraordinary conditions. The material has been used in arched form for bridges over roads and rivers with spans equal to those of masonry bridges. For the projected bridge Professor BURR has arranged a central opening of which the span will be 710 feet. That is far in excess of any masonry arch hitherto constructed. The details of the bridge have been under consideration for over a year and various engineers have examined them. But there is no doubt they will be subjected to keen criticism in other countries as well as in America. Courage is, however, sure of respect in the United States, and the experiments hitherto made throughout the country have proved that the limitations of the material are not yet defined. When it is known that a tower in New York has been carried up to a height of 612 feet, it is allowable to assume that an equal if not a greater dimension may be adventured in an horizontal arrangement.

## ILLUSTRATIONS.

NEW PREMISES FOR THE NORWICH UNION LIFE INSURANCE SOCIETY.

WE publish in our current issue, by the courtesy of the architects, Messrs. ERNEST RÜNTZ & FORD, their design for the new building to be erected on the important West-end site at the eastern corner of Piccadilly and St. James's Street for the Norwich Union Life Insurance Society. The building is designed for banking and other commercial purposes, and has been so planned that the dividing up of the various floors can to a large extent be governed by the nature of the business to be carried on. Forming as it does, in conjunction with the opposite corner (where the new building for the Royal Insurance Company is being erected from the designs of Mr. JOHN BELCHER, A.R.A.), the "gateway" of the thoroughfare leading directly to Marlborough House and St. James's Palace, we are pleased to hear that both buildings are being erected in Greek pentelikon marble, supplied by the Marmor Company, so that there will at least be a harmony of material, which should greatly enhance the appearance of the historical street of St. James's. The lower portion of the building illustrated will be faced in jasper serpentine, ranging in colour from purple to heliotrope. The roof will be in purple Broseley tiles, and the sculpture, balconies, gutters and some other features will be of bronze. It will be noted that a somewhat ingenious method has been adopted by the architects for stopping main cornices, thereby surmounting the difficulties often experienced by these features overhanging adjoining premises. It will also be observed that the usual turret for corner premises has been

omitted and a somewhat new treatment introduced, giving an opportunity for the legitimate use of sculpture, which in this instance will consist of a group of b.

figures representing "Justice," "Forethought," "Thrift," very happily conceived to denote the purposes of the insurance world. Operations have commenced and the building will be completed in July 1902. Messrs. PATMAN & FOTHERINGHAM, LTD., have been entrusted with the contract, after keen competition by Mr. HIBBERT BINNEY, who designed and executed the frieze at the Gaiety Restaurant, has been entrusted with the design and execution of the group of statues, a photo of which we reproduce. The central figure represents "Justice," the female figure "Thrift," and the male "Foresight."

We understand that contracts in connection with the building have been let as follows:—The heating, ventilating and radiators by Messrs. STRODE & CO., of Osnaburgh Street, N.W.; the lifts by Messrs. ARCHIBALD SMITH & STEVENS, of Battersea, S.W.; and the wood-block floors by the Zeta Wood-Block Floor Co., of Crispin's Wharf, Marshgate Lane, Stratford.

NEWDIGATE PLACE, SURREY: THE HALL.

THIS house is erected on an elevated site overlooking Leith Hill, with lovely views over Reigate and Horsham. The walls are faced with local bricks, the upper part being covered with weather tiles. The roofs are tiled; the whole of the external woodwork is of oak, cut from trees grown on the estate. The hall has an open oak timber roof, with a gallery roof on two sides lighted by stained-glass windows. It is panelled to a height of 10 feet with oak panelling, a carved screen separating the hall from the staircase, which is also of oak. The dining-room has oak panelling with oak beams to form panelled ceiling. The drawing-room has a deal dado, painted ivory white. The billiard room has Oregon pine framing carried up to under the frieze. All other internal joinery is also in Oregon pine, stained and beeswaxed. The house was erected by Messrs. J. & J. WARD, of Worlington, from designs and under the superintendence of Mr. HATCHARD SMITH, F.R.I.B.A., who also designed the decorations, which were carried out by Mr. CARRICK REIGATE.

CLYDE STREET SCHOOL, HELENSBURGH, N.B.

CATHEDRAL SERIES.—SOUTHWARK: NORTH CHOIR AMBULATORY.

## FIRES IN HOSPITALS.

President of King Edward's Hospital Fund for London, the Prince of Wales, in February, requested Messrs. Massey Shaw and Captain Wells to give advice on the method of securing protection against fire in the hospitals. The two experts have prepared a report in which they say:—

Submitting suggestions for safety from fire which are generally applicable, it must be plainly stated that suggestions to be practicable must be very few in number, as otherwise many of the most obvious and important of them would not be applicable to more than a few buildings.

There has never been a general or generally recognised method of constructing hospitals; on the contrary, all that we have ever seen have been situated apparently where ground was available, whether suitable or not, and to be constructed by different architects or builders on different plans, or even in some cases by the same architects or builders but on different plans, although in the same town or city. For this want of system there can be no remedy, as each case must depend on local circumstances and conditions—especially local finance.

For these reasons it is absolutely necessary to say that, although in any one case there may be no difficulty in obtaining a complete and exhaustive report upon which recommendations might be based, such a report could not be applicable to others, as in each case the individual circumstances would have to be specially and separately considered.

Nevertheless we may, however, remark incidentally that in the construction of hospitals it would be an advantage if the site and structural considerations could, to some extent at any time, be influenced by the committee of the fund, with reference to safety of life in case of fire or panic, and to insure for future hospitals some "system" in their construction.

Cleanliness and freedom from dust are, of course, very essential for reducing risks of fire; and in one important point hospitals have an advantage over almost all other public institutions in having virtually a watch on the door in the shape of nurses, who are never absent.

We repeat that exhaustive recommendations in the case of individual buildings could only be drawn up upon a basis such as would be made by an experienced fireman, of the particular institution. But we enclose in an annex a series of suggestions framed entirely with the view of helping existing authorities in existing circumstances, while we do not entertain the idea of responsibility for the committee of the Fund or for ourselves. It is again clearly stated that in many of the smaller hospitals no steps in the way of safety are possible without great care and cleanliness on the part of officials, and constant watchfulness for the first symptom of danger, however slight, and immediate notice to all concerned, both inside and outside the premises.

The suggestions are classified as (1) points which should be borne in mind by hospital committees when framing regulations, and (2) points which should be remembered by the staff when an alarm takes place.

The first class are the following:—

It is important to have some arrangement for warning those who should be alarmed. In arranging the method for alarm, it is necessary to avoid startling the patients unnecessarily. Police whistles distributed are of consideration, and would have the effect of summoning aid as well. Every endeavour should be made, however, only to disturb the affected area.

Each building containing patients should have means for immediately despatching information to the nearest fire brigade or police-station, and the nurses or others in charge should be instructed as to the proper mode of sending for this external aid without waiting to see whether their own local appliances are sufficient or not. If the hospital is not on the telephone, the staff should know where the nearest fire-alarm post in the neighbourhood is located and how to use it. This information should be given on the card of printed regulations. In order to save expense, an offer might be made to the fire authority to allow a public fire alarm to be placed at the hospital gate, which would be available for use by the public as well as by the hospital officials. If the hospital is on the telephone, the London Fire Brigade should be summoned by telephone and by fire-alarm post in the street. A following slip should be posted near the telephone, if possible:—

"In Case of Fire.—Ring up in the usual way. Say,

'Put me on to the fire brigade.' When answered, say, 'Fire at \_\_\_\_\_ Hospital, \_\_\_\_\_ Street, &c., and any detail that your presence of mind dictates, viz. large, small, roof, basement, &c.'"

3. The regulations of the hospital should provide for an organisation that will immediately stay "panic" and guide the patients to safety. If alternative staircases are not available, anything like a cul de sac, where several are accommodated, particularly on upper floors, requires special attention and consideration.

4. Every hospital should have within its walls some "first aid" apparatus to deal with the outbreak. As the probable position of any outbreak can generally be foretold, the risks should be located and studied beforehand. Roof, kitchen, store-rooms, cupboards, heating-places, workshops, laundry, &c., are examples of likely danger points. Fireplaces and guards, gas fittings (especially swinging gas fittings), curtains, rubbish collections and places where candles and matches are used near clothing and bedding should also be studied. Fire drills adapted to the special dangers of the particular hospital should be quietly arranged periodically. This location of risks is the essence of effective fire drill. Certain of the staff should be detailed to handle the hospital fire appliances and they should know this is their job. They should be so selected that some will always be present. The whole number should periodically be summoned to the different "fire risks" for drill. An ordinary mop and bucket will prove useful, in the early stages, to splash water, and anyone can use them. Should the fire be due to electricity or upset of oil, be careful in applying water, but rather endeavour to smother with sand or wet blanket till the fire brigade arrives.

5. Printed instructions should be posted up freely, so that all are reminded that fire is a possible contingency. These instructions should deal with all the foregoing points, with any additions or amplifications appropriate to the particular hospital or to its appliances.

It is recommended in the second class that the following points should be remembered by the staff when an alarm takes place:—

1. On the discovery of a fire or on smelling smoke the staff and employees should not run about aimlessly or shout or shriek, &c., but quietly think and act on the instructions for raising the alarm.

2. The first object is to prevent "panic" among the patients and visitors, if any.

3. If the fire brigade has been called, the actual fire damage should not be much in the thoughts of the staff. It is imperative to see to the removal of patients who are in danger to safety, which is, as a rule, out of the smoke-area, and preferably outside the building involved if a comparatively small one, or into a separate block if a large one. In a densely smoky atmosphere a wet flannel over the face is beneficial.

4. Those detailed for appliances should go to the duty at once, and endeavour to check the progress of the fire. It would be as well also for some one in authority on the spot to detail those who are to remove patients, and also those who are to receive them and see to their proper clothing and comfort.

N.B.—As far as the details of the actual steps to be taken when an alarm takes place are concerned, the printed regulations drawn up by the individual hospital, and the periodic fire drills, should insure that every member of the staff knows what is his or her duty in the event of an alarm of fire.

**A Meeting** was held in the Mansion House, Dublin, on Friday, with regard to the erection of the Parnell monument. The report of the committee stated that subscriptions to the amount of 5,978*l.* were collected. The statue by Mr. St. Gaudens cost 25,000 *dols.* There has been paid in respect of this contract the sum of 5,191*l.* 18*s.* 5*d.*, and the statue and all the bronze ornamentation for the monument, together with the plans, specifications, &c., have been delivered, and are at present in the Royal Hibernian Academy. In order to complete the monument according to the sculptor's plans, all that is now requisite is that sufficient money should be raised for the erection of the masonry and architectural work. Estimates for this work have been obtained, the lowest of which amounts to not far short of 3,000*l.* It is considered that this work will take several months to complete.

## SCIENCE AND PRACTICE.\*

THE words "science" and "practice" are somewhat loosely used, and it is difficult to attach a definite meaning to either. The dictionary does not help us much, and literature perhaps helps us less. The dictionary states, "Science is literally knowledge, but more usually denotes a systematic and orderly arrangement of knowledge." "Practice, the actual performance of the application of knowledge or science to the wants of men." From this it would appear that science or knowledge must precede practice. Sir William Hamilton has long ago stated the distinction more clearly—using, however, the word theory instead of science. "There is a distinction, but no opposition, between theory and practice. Each, to a certain extent, supposes the other; theory is dependent on practice, practice must have preceded theory." This appears to me the more natural relationship. Practice generally exists first without explanation, and science is in the first instance an attempt to explain practice by theories. In modern times this attempt to explain is partly experimental; and experiments lead to the discovery of new facts, which themselves both aid explanation and require explanation.

The function of science lies in the explanation of existing facts, and in the prediction and discovery of new facts. In ultimate or fundamental explanations, science has signally failed. No single complete explanation is to be found in the whole realm of modern science. Even the simplest of fundamental concepts have to be accepted without real understanding. In proximate explanation, however, she has been very successful. Vast numbers of apparently dissimilar phenomena have been shown to be similar and capable of classification in comparatively few groups. Practice then concerns itself with the doing of things, and science with the explanation of things which have been done.

The task of the engineer is to do things, whether he understands them fully or not. If he waits to understand all the various operations involved, he will never succeed with his process or produce his machine. This is evident upon studying the process of evolution of any invention. The progress of heat-engines furnishes clear evidence of this.

Science has thus acted on practice; and practice, in turn, acts on science. New forms of heat-engine—for example, the steam turbine and the gas-engine—have given rise to further investigation on the scientific or abstract side, and to-day a host of investigators are at work on further studying the properties of steam and investigating the properties of air and flame, so that practical application and scientific investigation go hand in hand, each aiding the other. Even now, however, after more than two hundred years of steam-engine practice, we do not fully understand all the phenomena of the steam-engine. Still less do we fully understand those of the gas, petrol and oil-engine, although active experiment in such engines has now gone on for over one hundred years, and it is forty-seven years since the first fairly commercial engine appeared in Paris. The practice of the gas-engine includes among its most noted foreign names Lenoir and Otto and Daimler; and its science, Beau de Rochas, Slaby and Witz. Of home names there are many, but I need not go over them. They are well known to you all.

The story of the gas-engine shows the same imperfect knowledge, but shows also practical success attained notwithstanding ignorance. In 1876, for instance, Dr. Otto thought his success due to the use of stratification in his engine, while in actual fact stratification had nothing whatever to do with it. His success was wholly due to correct mechanical detail and the effective use of compressed gaseous mixtures. Following Macquorn Rankine, Witz, your President and others have calculated the effect of compression, assuming simplified cases. Such calculations were made originally in 1882, and have proved a sound practical guide during twenty-nine years.

I mention these matters to show that the practical man has many serious problems to face—that he cannot always wait to understand every part of his field before finding a solution; and that, consequently, the solution found by him often includes a multiplier intended to neutralise the effect of ignorance. An engineer need not be ashamed to own ignorance; but he must know exactly where his ignorance lies, and, broadly, the proportion to be allowed to cover that. The late distinguished engineer, Sir Benjamin Baker,

for example, I understand, felt many doubts as to calculations of compression strains in the long struts formed part of the Forth bridge. But he estimated the extent of his ignorance and provided for it successfully that the Forth bridge stands to-day. The American engineers who designed the Quebec bridge were more particular to design it in a form in which, according to estimates, the stresses could be more accurately determined, but, unfortunately, they do not appear to have estimated the particular part to which this proportion of ignorance was applied. Hence they failed and their bridge fell.

In many other matters we have to be content with a partial solution of problems, and study of difficult mechanisms which have been produced shows faults to be remedied. Where those faults bear upon the health and life of a whole community, engineers should take a serious view of their responsibilities. In the matter, for example, of the enormous extension of the use of motor and motor 'buses, with petrol engines, it is necessary to recognise the fact that, under certain conditions, engines discharge as much as 10 per cent. of the poisonous gas—carbonic oxide—into the street. It is the engineer's duty to study these conditions, and to so arrange the mechanism as to make life in our large towns healthy and safe.

This question of carbonic oxide arises in matters of great interest to the members of the Society of British Gas Industries. It is the ambition of all gas men, if I so call them, to find as many uses for coal gas as possible, and they have been enormously successful, both as to economy and motive power. If gas consumption is to greatly increase in gas-fires and gas-stoves, it appears to me desirable that you should study the problem much more closely than has yet been done. A great mistake is made by many engineers—and, I may say, journalists. They treat the consumption of gas in closed spaces as if the matters considered were merely those of consumption of oxygen and its replacement by carbonic acid gas. I agree that so far as the production of carbonic acid is concerned there is no great harm in open gas-stoves or in closed fires. The conditions of combustion of gas, however, are such that, unfortunately, carbonic oxide is readily produced, and this, it cannot be too clearly recognised, is a very poisonous gas. So far as present open gas-heaters are concerned, this problem does not appear to be satisfactorily solved. Undoubtedly very many of them produce carbonic oxide. The test of this is unfailing, even apart from the chemical methods of examination. The human being is a delicate reagent to carbonic oxide. I know it myself, because I am long familiar with the effects of carbonic oxide poisoning. Many people have severe headaches with even a minute trace of carbonic oxide in the atmosphere. In many gas-stoves introduce a quite sufficient trace for this purpose.

I am, as I have already said in another place, entirely against the heating of rooms by the products of combustion of either gas or coal admitted to the room itself. It is to heat in this way, it is true; and the heating efficiency so far as heat is concerned, is great. But it is not efficient heat without producing carbonic oxide in some proportion or other; and this should entirely banish such gas-stoves unless some of you can come forward with a solution of the problem of so burning gas as to produce no carbonic oxide whatever. Even then, however, it is not advisable to burn by sending the products into the room. It is far preferable to burn as little gas as possible in a room. This is not attained, so far as lighting is concerned, by the Welsbach light; but so far it has not been very perfectly attained in any gas-stove. Even gas-stoves furnished with flues to carry away the products of combustion often discharge a large quantity of products into the room. This should be remedied. It appears to me that in designing gas-stoves some fundamental principles have been neglected. It is a well-known fact that if a gas flame, or practically any flame, comes in contact with a cold surface, or even with a cold surface at all, the combustion becomes imperfect and carbonic oxide is produced. If the gas could be burned in some way so that combustion was fairly complete before the mass of the products struck any solid body, a great improvement would be effected, and practically no carbonic oxide would be produced. Such a stove may be difficult to design; but, in my view, it is well worth designing.

When the members of the Society of British Gas Industries have greatly improved their fires and stoves, they have advanced forward to an enormous extension in the use of such fires and stoves; and, accordingly, a great extension of the

\* From the address by Dugald Clerk, M.Inst.C.E., F.C.S., president, delivered before the Society of British Gas Industries.

al gas and the purification of the atmosphere. With such improvement, however, it would not purify the sphere to replace visible smoke by invisible carbonic. I am now speaking from the scientific side, and it very well be that the practical problem presented is a difficult one to solve; but it is for you to solve it.

I have said enough to show how, in my view, practice describes science and suggests problems for solution by science; while even the partial scientific solution of a problem suggests new fields of practice; and so one reacts on the other until it is difficult to say which is the more important. There is a difference, however; but notwithstanding the difference, practical men of to-day should be thoroughly acquainted with the results of science, if not in all fields, at least in their own.

Examination of the history of the rise of any industry is at first a certain thing done which is useful to mankind; and the understanding of the thing done, at first very imperfect, as the years go past increases more and more. This is very clearly shown in the gas industry. At first, a long knowledge that coal, when heated in a tobacco pipe, produces gas through the stem, which can be lit; and the application of this elementary fact by an able man, Murdoch to the lighting of Boulton and Watt's works. In years of practical application, and considerable commercial and practical success, while yet the complicated chemistry of destructive distillation was unknown. The products of the gas-works, however, gave scientific men objects for study. Taking one instance only, the discovery of benzol, and from benzol the discovery by Faraday of carbene, has led to enormously important industrial scientific results. In the same way, the study of the phenomena of flame luminosity, originated by gas-lighting, passed through many stages, until a combination of chemistry and practical application was made by Welsbach, which brought all the accumulated knowledge, both practical and scientific.

Numerous scientific discoveries have been made as the result of the gas industry, and numerous practical applications have been made as the result of scientific discoveries. The whole of our gas industry has advanced science, and has been advanced by scientific investigation. Not one article manufactured by the members of this Society, or one product which the members supply apparatus, but has not the subject of long-continued work by many minds, both scientific and practical. The union of science and practice is becoming more and more firm. In older times professors of our universities were accustomed to deplore the ignorance of the manufacturers in scientific matters, while the manufacturer was accustomed to smile at the ignorance by the professor of the practical problems which he had to be faced. A truer appreciation of both departments of work has been attained, and this was very visible in the British Association address of Professor Sylvanus Thompson this year. That address showed a complete appreciation by a scientific man of the work done by the practical man; and I think I can say now that the practical man, on his part, appreciates entirely the work of the scientific man.

In a matter more nearly concerning ourselves, this Society of practical men has had great pleasure in co-operating with the other branch, the professional side of the gas industry, and as a first result of this co-operation great success was attained at the recent Manchester Gas Exhibition. In my view, the co-operation of the Institution of Gas Engineers with our own Society is one which closely embodies the co-operation between science and practice. This is entirely necessary for the other.

### THE MANCHESTER INFIRMARY.

THE special committee of the Corporation who are investigating the subject of the utilising of the infirmary and its site recently requested Mr. T. E. Collcutt, P.R.I.B.A., to prepare a report on the subject. It has been issued and is as follows:—In compliance with the invitation from your Council, conveyed to me by the city architect, to report on the possible adaptability of the Royal Infirmary buildings for the purpose of a reference library, art gallery and municipal offices, I now beg to say that I have inspected the buildings of the building, and have the honour of reporting the conclusions of my investigations. The city architect supplied me with plans, sections and elevations of the buildings in their present state, which I have found of the greatest service in studying the problem I have before me. He has

also forwarded me a mass of literary matter from the Manchester newspapers, including the whole of the correspondence appearing in the *Manchester City News*, which I found contained many interesting suggestions on this important question.

I have made a very close inspection of the art gallery, and also the free library, housed in the old town hall in King Street. I was much impressed by the art gallery buildings; the lighting, wall space and planning seemed to be all that could be desired. The free library, on the other hand, is in my opinion housed in a most deplorable manner. I was surprised to find such a very valuable collection in a building far from fire-resisting, and I can quite appreciate the anxiety of mind of those who must feel responsible for the safety of its contents. I was enabled to form an idea of the size and importance of these collections and to appreciate their probable growth in the near future.

I made a very close inspection of the infirmary buildings, in which I was assisted by the city architect and the clerk of works of the infirmary, and am of opinion that the building is a substantial and sound structure; there are some settlements of walls to be traced, but these perhaps may be owing to the nature of the subsoil, which I understand to be clay. These settlements, however, are not of a serious nature.

I am of opinion that it would not be a difficult matter to make considerable modifications to the interior without impairing the stability of the general structure. Nearly the whole of the corridors and staircases throughout the building are of fire-resisting materials, but the floors of the rooms and wards, excepting some portions of the basement and ground floor, are constructed in wood, and of course are not fire-resisting in the slightest degree.

In making myself acquainted with the immediate neighbourhood of the infirmary I was much impressed by the magnificence of the site, worthy, I venture to think, of a building of greater architectural merit than that of the present one. The Royal Infirmary is built in a strict Classical style. The architect seems to have followed very closely the remains of the ancient Ionic temple on the Ilissus, near Athens, which was illustrated in Stuart and Revett's "Antiquities of Athens," published 1762. Attention was drawn by Stuart and by subsequent writers to the fact that the entablature of this temple, *i.e.* the architrave, frieze and cornice surmounting the columns, must be considered more in harmony with the earlier Doric order than with the more ornate and delicate treatment found in all other Ionic buildings, and that probably this treatment was adopted to admit of sculpture to the frieze in somewhat the same manner followed by the architects of the Doric order. There can be no doubt that this sculpture was necessary to bring into harmony what would otherwise have been an incongruous mixture of the two orders.

Be this as it may, the severe and bald treatment of the architrave, frieze and cornice of the infirmary buildings appears to me to be absolutely inharmonious with the Ionic columns. Furthermore, the building is not designed consistently; the entablature is not a continuous feature, as it should be, but is abandoned in places to allow of the introduction of windows to the various rooms, with the result that the effect is not only incorrect but is very displeasing.

I am sure that most Classicists would agree that this building is anything but a happy illustration of the Ionic order, and that the massing of the wings of the building is out of proportion with the central feature. The general effect is uninteresting, sombre and depressing, not so much from the unhappy colour of the building as to the lack of Classic knowledge and refined feeling in the design.

I may be travelling beyond the scope of the instructions of your Council in criticising the architecture of the buildings, but I am venturing to do so because I feel very strongly that such a noble site deserves to be adorned by a building of finer architectural conception.

In studying the question of the adaptability of this building for the purposes of an art gallery, free library, &c., I have borne in mind the requirements necessary to be fulfilled in designing either an art gallery or a free library. In an art gallery the number and dimensions of the rooms must be determined by the number and importance of the specimens to be exhibited. The site also should be isolated, to prevent fire from the adjoining buildings and to enable the largest possible amount of light to be obtained. Where it is possible a building of this character should be mostly of one storey; where two storeys are compulsory the lower

one should be at least sixteen feet high, and would, of course, be side-lighted. This method of lighting is not objectionable, and indeed for some pictures it may be considered preferable to top light. But the windows should have a superficial area equal to one-sixth or one-seventh of the floor area, the sills should be about six feet from the floor, and the top of the windows should be as near the ceiling as possible. The rooms should be arranged so that visitors should not have to pass a second time through any of the rooms.

Space should be provided for temporary exhibitions and some accommodation provided for night attendants. Store-rooms, which may be in particular cases provided on an upper floor or basement, should not only be absolutely dry, but they should be lighted by windows to the outer air. Large lifts should be also provided for conveying heavy sculpture if gallery is placed on an upper floor.

With regard to the free libraries, the rooms should be of sufficient height to allow of a gallery being constructed round the rooms for access to shelves. All rooms, including store-rooms and repairing-rooms, should have direct light in the open air.

I have mentioned these principles, as it is of the utmost importance that they should be borne in mind in considering the problem whether the infirmary can be satisfactorily altered and adapted to the purposes of an art gallery and free library.

In the first place it is obvious that an art gallery might be provided on the top floor. A new fire-resisting floor could be inserted, internal walls could be removed and the necessary top light provided. To do this, however, it would be necessary to block up the windows to the exterior elevations, with the result, in my opinion, of destroying what little interest the building may now possess. I am quite aware that it has been suggested to treat the spaces formed by the building up of these windows with some sort of sculptured ornament, but this suggestion, I feel confident, cannot commend itself to anyone having a knowledge of architecture.

Assuming, however, these objections are not of great importance, I am quite convinced that it could only be done at the expense of rendering the rest of the building unsuitable for the purposes of a library. I find that the lower floors are not sufficiently high for library purposes.

It has been suggested that the inner open court of the building might be used partly as a reference library, but to do this it would be necessary to block up all windows to the surrounding rooms and thus render them useless for library purposes. Such an arrangement would also seriously affect the proper lighting and ventilating of the building, which is a very important factor to be considered. Moreover, the maximum floor area that could be obtained (even including a possible extension of a connecting gallery to the north) would be inadequate properly to house the present collections.

My conclusions are therefore that, although it might be possible to form the upper floor into an art gallery, it would certainly be impossible at the same time to form the lower floors into a library, and that any attempt to adapt this building for the purposes of an art gallery and library would certainly result in disastrous failure.

### EXPLORATION IN WALES.

IN connection with the School of Archæology of the Liverpool University a committee has been formed for "Excavation and Research in Wales and the Marches." At the inaugural meeting Sir John Rhys, according to the *Liverpool Courier*, said he believed the work of this committee formed part of a greater scheme, which was to do justice to the whole Celtic question from the beginning—to language, literature and archæology. In the Liverpool University, which was to undertake valuable work in this respect, there was an unusually strong staff of archæologists, and he hoped that what was going to be essayed for Wales would be done with the co-operation of the professors in the Welsh colleges. The Cambrian Archæological Society, he knew, would hail with delight any assistance it could obtain from Liverpool. Personally, he had been an archæological fraud all his life, but he now and then was called on to answer letters from some Mr. Jones who wanted to excavate a mound on his farm, whose only qualification for the work was that he had seen graves dug. He usually tried to dissuade Mr. Jones from attempting to spoil the thing for ever for any future generation, but in such cases he found people did not

ask for advice intending to take it. The more people read about archæology the more they itched to be digging, and in the full confidence of ignorance did much harm. With their excellent staff of archæologists in Liverpool they would be able to teach how to do these things without ruining the ancient monuments of the country. There was a great field to explore. Going west from Chester along the north coast into Wales they would not travel far before they saw Moel Famau, which probably meant "the round-topped hill of the mothers," and "mothers" in Celtic always meant mother goddesses, which played the same rôle in Celtic paganism that the Madonna did in Latin Christianity. Nobody had yet looked on Moel Famau for traces of anything commemorating the mother goddesses, but there must be a temple somewhere. In the valley of the Conwy there were also tumuli, in respect to one of which he was glad once that an old clergyman who dabbled in archæology was prevented by the landowner from breaking into it, doing damage. At Penmaenmawr there was a vast formation of a prehistoric nature, which he hoped was threatened by the quarries, though that looked to be a case. Further on at Dinorwic, the key to the Snowdonia district, there was a vast mound whose name meant "The Fortress of the Ordovices," that was apparently used by the Romans. He did not know if it had ever been explored, but he remembered that when taking rubbings of an inscription there he had one interesting spectator, a heifer, which partly demolished his umbrella. They knew how necessary an umbrella was in the neighbourhood of Snowdon, but he was afterwards consoled by the damage by learning that the same heifer had eaten a farmer's best linen shirt. After a reference to Dinas Dinorwic, which the speaker said led them into the classic ground of the Mabinogion, Sir John Rhys remarked that in research into these places they required the help of others than archæologists. He had no doubt that in Liverpool there was a scullery—not a culinary department—but a place where the students of skulls and skins carried on their investigations, and these could give great assistance in the study of the subject. Opposite Carnarvon there was another place called the "Red Fort" on a vastly small scale, where there was a very early Celtic inscription, where he would like to see an excavation that might throw light on the origin of the place. Although a poor man, he had spent a considerable sum in rubbing the moss from a great number of Celtic inscriptions in Wales, Ireland and Scotland, or anywhere where he could hear of them, but that was merely scratching the surface. A great deal had been gained from it; but they wanted to dig into the internal depths of these old monuments and mounds and fortifications to see if they could unearth the secrets they had held so long. After a reference to the forts at Trer Caeri and Carn Fadryn, the Roman remains at Caergwrie, near Wrexham, and the Pillar of Eliseg at Llangollen, Sir John spoke of the openings for archæological research in Shropshire, Uriconium and in the neighbourhood of the Wrekin, at which he offered some original suggestions. In conclusion, he remarked that in any town but Liverpool there would be faced by the question, "What is the good of this?" Tacitus, in speaking of this country of ours, said very little was known about its history, as was usual among savages. In any other city in the kingdom he was afraid this would not have any effect on his hearers, but Liverpool had a most go-ahead university, and had got hold of strenuous men who were determined to make progress, and they were backed by a class of wealthy citizens who were more cultured than any corresponding class in any city would say, in the whole of the Empire. He therefore felt extremely sanguine in making that appeal there.

### ESSENTIALS IN ARCHITECTURE.

AN address was delivered by Professor S. H. Carpenter, M.A., of the Manchester University, to the members of the Sheffield Society of Architects and Surveyors on "Some Essentials in Architecture." After noting Mr. Belcher's analysis, in his recently published volume, of the principles and qualities to be looked for in buildings, the lecturer briefly discussed, from the architectural point of view, the relation of beauty to truth, and then considered the different phases of truth in architecture—truth in materials and in construction; in the interpretation of construction and the consequent character imparted to building. The Greeks, he said, were the first to study

top the full resources of their materials, with æsthetic considerations as the predominating factor of their architecture. With their persistent appeal to reason, and their faith in reasonableness as the true basis of beauty, the Greeks in their architecture reached a level of achievement which has never been attained; and their work, although somewhat restricted lines, remains as one of the standards to which we naturally appeal to this day. Contrasting Gothic architecture with Greek, Professor Poel pointed out that truth to materials, though never used, was subordinate in importance to truth to construction in the architecture of the Middle Ages; and that, as joining these two great principles of material and constructive truth, Gothic building, at its highest, had never been surpassed. As compared with Greek and Gothic architecture, Roman work, magnificent as were the achievements of Roman Imperial architecture, and Romanesque, extremely interesting though its varied efforts were, and as were the strides it made in progress and development, must be considered as inferior and on a lower level of architectural truth. Much of our modern work—probably much of it—fell far below the standard set for us by the Middle Ages and by Greece. Hence the importance for architects of a thorough study of the greatest achievements of the past, as giving them the highest standard towards which to strive.

A vote of thanks to the lecturer was passed, on the motion of Mr. E. M. Gibbs, seconded by Mr. T. Winder, supported by Mr. C. F. Longden and the chairman.

### THE ELIZABETHAN PLAYHOUSE.

A LECTURE was given last week by Mr. William Poel in the Abbey Theatre, Dublin, on "The Elizabethan Playhouse," which was illustrated by a series of screen-plays, in which were shown ancient Greek and Roman theatres, the forms of the ancient Greek and Roman theatres, the types which those of later Italy assumed, and also the form of the Elizabethan open theatre, which was developed in England by the needs and circumstances of the time, together with views of costumes and of the style in which plays were produced.

Mr. Poel said:—Although the Church was now separated from the stage and the stage from the Church, and each lived on a more or less independent existence, yet the connection had not been so long in use that the connection between Church and stage had been entirely forgotten. The seriousness that pervaded the work of the Elizabethan dramatists was partly due to the fact that they recollected that the drama had a responsibility something like that of a teacher. The true function of the drama was to teach as well as to amuse. He did not blame the commercial theatre. It was an institution that could not be run on other lines. But it had its disadvantages, and at the moment a theatre was established that was not supposed to be run on commercial lines, a comparison was immediately instituted between the work of the theatre that must influence the commercial theatre. He had often felt that if he were in a position to dictate to theatres he would say:—"You may have twenty theatres in your city, but only on one condition, namely, that there shall be no protective theatre in which the interests of the public shall be protected and the interests of art shall be protected, and which shall, therefore, be looked on as a Temple of Art." The commercial theatre drew a crowd who paid their money for seeing what they liked to see. The tendency of the protective theatre was quite different. The former institution deadened intellect; the latter stimulated it. The arts of the ancients originated with dances, songs and games, and were in part religious services. The players in Greek dramas wore masks to disguise their personality. The stage was an open one and the theatre sometimes held as many as 30,000 people. The features of the masks corresponded to the tragic or comic character of the plays, and the actors wore stiffs. The stage did not represent any particular scene. Only the words of the poet and the action of the characters constituted the representation. Such was the Greek theatre about 458 B.C. The Japanese stage of that day resembled that of those early times. In Rome about 55 B.C., when the age was one of luxury and decadence, the theatre assumed a different form. The building was a beautiful one, and then, for the first time, actors appeared on a raised platform, instead of speaking and acting on a central space as before. That form travelled through Italy into France, and became the stage of Molière.

The first Elizabethan stage resembled that of the Greeks more nearly than the Roman stage. The defeat of the Armada awakened the English people to a sense of themselves, and was the parent of historians and dramatists. The first London plays were performed in a courtyard, approached by an archway, and the crowds and tumult that it gathered in the street, and consequent danger to shop windows, led to the providing of other means of exhibition. The first Globe theatre was a little round building on the north side of London, and in the screen picture they could see it and the bear garden. The next theatre was an octagonal structure. These were of about the date A.D. 1610, and nothing was then known about the Greek stage; the dramatists and actors were guided by the customs of their own country only. The plays had been previously exhibited from raised stages in inn yards. It might be hard to convert his audience to the opinion that the exhibition of a play from a simple raised stage, without scenery, was better than a modern theatre; but what the audience should be really interested about was what the actors said and did. When this mode of representation was lately tried in London with plays of Shakespeare the actors to whom it was proposed at first strongly objected, but afterwards gave way, and in the result it was found that Shakespeare's words gave them everything that they wanted, and they were lost in the author's words coming through the actor's mouth. Don't run away with the idea that this sort of thing made the play ridiculous—it did not. A point of the greatest importance was that the characters should be costumed exactly according to the period of the play and the dresses that the rank of the *dramatis personæ* and the situations that arose in the text required. This had been often ignored and it showed a great want of intelligence. Olivia, after the death of her father in Shakespeare's play, should appear in black; but some modern actresses had objected to that on the ground that it did not become them. Again, after Hamlet had been shipwrecked and robbed by the pirates he should not be seen dressed in palatial apparel. Shakespeare had given Greek names to several of his personages, but that did not warrant their being attired in Greek habits, as had frequently been the case in modern theatres. Errors of this sort were due to a desire on the part of actors and actresses to look pretty and sentimental.

### VALUER AND SURVEYOR'S EXAMINATION.

IN Ireland, unlike England, Scotland or Wales, there is a Government department for the valuation of the country. A competitive examination for a valuer and surveyor (second section) was held last month in London and Dublin. The limits of age were from twenty-two to twenty-eight years. The subjects for examination were English composition, including handwriting and orthography; arithmetic; land surveying, including draughtsmanship and the making and plotting of surveys; and either architectural surveying and valuing (for rating purposes), or practical farming, including the elements of geology and chemistry as applied to agriculture and land valuing. There were forty candidates for the single appointment.

For English competition three subjects were offered, of which one was to be selected. They were, "How would a system of Protection affect Ireland?" "The reclamation of bog-land," or "Alien immigration." Seven questions were proposed in arithmetic. For land surveying a plan of an estate was given, and the candidates were to mark in all the lines to be set out and chained. A field book for the survey was also to be prepared. For the second exercise a plan of the estate to a scale of three chains to an inch was to be plotted. The conventional manner of indicating a wood, orchard and marsh was to be shown, roads were to be coloured with a light wash of burnt sienna, buildings hatched, ponds coloured blue and title printed.

The following were the exercises in architectural surveying and valuing:—

A client wishes to erect a factory on a rectangular site fronting a public road 40 feet wide, with the following requirements:—

Block of offices—two floors—40 feet square.

Main factory—three floors—covering a ground area of 3,000 square feet.

Oil store with ground area of 200 square feet.

Stabling for four horses with loft accommodation.

Four-bay open shed.

"Draw" to any usual scale, in pencil, for the use of the

client, a ground plan of the proposed buildings arranged on the site, and simple front and side elevations.

Assume proper prices per cubic foot for all the buildings and estimate approximately the total cost of erection.

Make a freehand sketch (using pencil only) of the front elevation of a modern house of a rental of about 60*l.* per annum. Details of at least one window and door are to be shown.

Give shortly the usual methods which are adopted for arriving at the rateable value of (a) private house owned by the occupier; (b) gasworks; (c) factory; (d) brickyard; (e) licensed premises.

Give without comment six classes of property which are by law exempt from rating.

Estimate the rateable value of the following:—(a) A house let on full repairing lease at 100*l.* per annum; (b) a house let on a yearly tenancy of 100*l.* per annum, the landlord doing all repairs, which average 20*l.* per annum, and paying the tithe, which is 2*l.* per annum; (c) a factory held under a full repairing lease at 100*l.* per annum, including power plant, the property of the landlord, worth 400*l.* The tenant has spent 3,000*l.* in purchasing new machines (lathes, drills, &c.), which are worked by the power plant.

### BRITISH SCHOOL AT ROME.

ON Tuesday the annual meeting of the subscribers to the British School in Rome was held. The report, which was taken as read, stated that Mr. A. H. S. Yeames, of New College, Oxford, was appointed assistant director or librarian. The director, Dr. Thomas Ashby, had spent much time on the topography of the Via Latina, which formed part of his work on the classical topography of the Roman Campagna, and he and Mr. Baker Penoyre had visited Sardinia. The number of students and associates had considerably increased owing to the admission of students from the Royal College of Science, the Royal College of Art, the Royal Institute of British Architects and similar bodies of accredited position. Mr. J. P. Droop, of Trinity College, Cambridge, student of the British School at Athens, spent November and December in South Italy, devoting his attention to the question of the authenticity of Messapian inscriptions. Miss N. Erichsen continued her study of villas and gardens of the Classical and Renaissance periods. Mr. A. Graham Henderson, a student recommended by the Royal Institute of British Architects, pursued various studies in Italy. Messrs. J. Hindle Higson, A.R.I.B.A., and S. Herbert Maw, Soane medallist for 1905-6, spent three months in Rome in architectural studies. Mr. Arthur R. H. Jackson, of the Royal College of Art, South Kensington, visited Italy for the purpose of studying colour, principally in Venice. Mr. Allan D. Mainds, Haldane scholar of the Glasgow School of Art, during a stay of six weeks in Rome itself gave his attention mainly to the frescoes of Michel Angelo and Raphael in the Vatican. Mr. Harry Morley, Owen Jones student of the Royal Institute of British Architects, spent about six months in Italy, copying in colour the frescoes in the Vatican and the Sistine Chapel. Mr. F. G. Newton, architect, spent fully three months in Italy, and made detailed copies, in colour, of the stucco decorations in the columbarium of Pomponius Hylas on the Via Latina, just within the Aurelian walls, perhaps the best preserved specimen of that kind of work. Excellent work was also done by Mr. T. E. Peet, Mr. C. E. Stuart, Miss Sylvia M. Welsh, Mr. A. H. S. Yeames and Messrs. J. A. Bessant and Arthur Kidd, travelling scholars of the Royal College of Art, South Kensington. The receipts from subscriptions during the year amounted to 539*l.*, as compared with 522*l.* and 535*l.* in the two preceding years. To these receipts the Government grant must be added, making a total income of 1,091*l.*, as compared with 580*l.* The total expenditure amounted to 1,049*l.*

Professor J. S. Reed, the chairman, referred to the late Professor Pelham, who was one of the founders of the school, and said it was proposed to found a Pelham scholarship at Oxford for the promotion of studies connected with the work of the school. It was no disrespect to the school at Athens to say that the lines of study in Italy were broader and more multifarious; for the functions of the school at Rome went far beyond the borders of classical study, and any portion of that vast field, both of time and space, was open to the students of the school. He remembered a meeting of scholars, at which somebody said, "Roman art—why there's no such thing as Roman art." Mrs. Strong's volume on the subject was a sufficient answer

to such a statement, and Mr. Ashby's book on the Campagna was another. A most fruitful field was before them. Herculaneum, and hearty acknowledgment was due to Professor Waldstein for his labours in this direction. Although thanks were due to the Chancellor of the Exchequer for his aid, money was still wanting, and especially for the great work of cataloguing all the municipal sculpture in Italy.

### FIRE ESCAPE ARRANGEMENTS.

IN July 1907 the London Council approved a statement with reference to the requirements in respect of means of escape in case of fire from factories and workshops and certain classes of dwelling-houses and shops in accordance with the provisions of the Factory and Workshop Act, 1901, and the London Building Acts (Amendment) Act, 1905. It has since been pointed out by the London Chamber of Commerce that certain slight additions and alterations were desirable. The building committee consider that some of the suggested alterations are unnecessary, but that others, which make for elasticity without derogating from the Council's powers under the Act, should be accepted. The statement has been revised and the following details of the construction, &c., of means of escape are now proposed:—

#### I.—Enclosed and Protected Staircases.

A.—*Internal incombustible staircases.*—(a) The staircases, including landings, lobbies and passages from one flight to another shall be enclosed by walls not less than 9 inches thick, the outer edges of the steps and landings being properly supported. (b) The staircases shall be ceiled with iron and concrete where they are not carried up above the roof or where they are carried up above the roof and liable to attack by fire from an adjoining structure. (c) The staircases, including the flooring in the lobbies, approaches, passageways, &c., shall be constructed of incombustible materials with solid square or spandril steps, which shall be supported at both ends on brickwork. The steps and landings shall be not less than 6 inches thick. (d) Spandril steps where used shall be of the following thickness:—(i.) For staircases 3 feet 6 inches wide, not less than 3 inches thick in the smallest part. (ii.) For staircases 4 feet 6 inches wide, not less than 4½ inches thick in the smallest part.

B.—*Internal Fire-resisting Staircases.*—(a) The staircases, including the treads, strings, carriages, landings, joists and floors should be constructed of oak, teak, jarrah, karrar or other hard timber of not less than 1½ inch finished thickness (no fir or pine must be used), and the enclosure to the staircase should be a solid partition of incombustible fire-resisting material at least 3 inches thick, carried up through the thickness of the floors. (b) The ceilings and soffits to the staircases and landings, if any, should be of plaster or cement. (c) A suitable balustrade should be provided where necessary to the outer string of the staircases.

#### II.—External Iron Staircases.

(a) The staircases, including the strings, bearers and supports, should be of iron, and constructed throughout upon dead bearings, to the satisfaction of the district surveyor. (b) The steps and landings should be constructed of solid or perforated iron plates (if perforated plates be used no perforation should exceed three-quarters of an inch across each way). (c) The risers should be of iron either solid or of a close pattern. (d) Where an external staircase is in general use, the treads and landings should be finished with a surface of approved non-slippery material as distinguished from perforated iron or chequered plates. (e) All windows and similar openings by or through any such staircase should be glazed with fire-resisting glazing, and where necessary the sashes and frames should be fixed. (f) A balustrade of a close pattern at a suitable height should be provided on each side of the flights round the landings. If balusters be used they should be not more than 6 inches apart. (g) The staircases should descend into the outer air, at the ground level, into a public way, thoroughfare, or some large open space.

#### III.—Generally as to Staircases.

(a) Internal staircases should, where practicable, be placed next to an outer wall, and be so arranged that persons enter them from any floor level in the direction of descent. (b) Internal staircases should be properly lighted and ventilated by windows, or, in exceptional cases, other effective means. (c) The treads of the staircases should be not less than 10 inches wide clear of nosings, and the risers

re than  $7\frac{1}{2}$  inches-high. (d) Staircases should be provided with handrails fixed upon both sides thereof, and continued round the landings and chased into the end of wall where these occur. (e) Where the doorways of staircases may be used as a means of escape by not more than 200 persons, they should be not less than 6 feet 6 inches wide. (f) Where the doorways or staircases may be used as means of escape by more than 200 persons or by more than 100 persons on any one floor, they should be not less than 4 feet 6 inches wide. (g) The doorways for access to and exit from the staircases should in all cases be of the width in the clear mentioned above when the doors are open. (h) All doorways leading to staircases should, where necessary, be recessed. The recesses should be constructed throughout of fire-resisting materials, and be fitted with doors of fire-resisting materials (oak, teak, jarrah, karri or other hard timber of not less than 1 inch finished thickness) in two folds hung so as to open in the direction of exit or to swing both ways clear of steps, landings, passageways and footways. Such doors must be fitted with springs, weights or other approved appliances to close them after use. The frames of the doors shall be bedded solid to the walls or partitions. Staircases should be arranged in straight flights, without landings; each flight should consist of not more than fifteen steps; landings should be provided at the top and bottom of each flight; the steps and landings should be of the full depth of the staircases. (j) Landing spaces not less than 6 feet 6 inches wide should be provided between the steps of the flights and the escape doorways leading to and from the staircases. (k) All supports to internal fire-resisting staircases and their enclosures should be of fire-resisting materials, and all ironwork supporting internal staircases and their enclosures should be protected by plastering or other incombustible or non-conducting external coating not less than 2 inches in thickness. (l) Doors at the head of staircases affording access to the roof should be glazed in the upper panels with ordinary glass.

#### IV.—External Iron Gangways and Balconies.

(a) These gangways and balconies should be supported on dead bearings and be provided with solid floors of incombustible materials; if perforated iron flooring be used the perforations should not exceed three-quarters of an inch across each way. (b) A suitable balustrade not less than 3 feet 6 inches high should be provided to these gangways and balconies.

#### V.—Enclosure and Position of Lifts.

In cases where a lift will, in the opinion of the Council, endanger the means of escape, the following requirements should be observed:—(a) Lifts, excepting passenger lifts constructed within the open wells of staircases and enclosed only with metal grilles, should not be placed near to escape staircases and shall not be connected directly therewith by means of openings or otherwise. (b) In buildings where fire-resisting floors are provided lifts should be enclosed all round with incombustible materials and fire-resisting doors or shutters. When the shaft of the lift is carried up to the roof it should be continued through the roof, and, if covered, in glass should be used, protected on the outside with strong wire guards. (c) In other buildings where there are large floors undivided by partitions, fixtures, &c., lifts may be placed as far as practicable from the staircases, exits, &c., and may be enclosed with fire-resisting materials to a height of 10 feet above each floor level and above this with stout wire-netting guard.

#### VI.—Buildings used for the Storage of Inflammable Liquid.

(a) Rooms in which inflammable liquid is stored should be separated from other parts of the building by brick walls and fire-resisting floors and ceilings. (b) Doorways for access to such rooms should be fitted with self-closing, fire-resisting or iron doors. (c) Adequate ventilation should be provided. (d) Living-rooms, workshops or work-rooms constructed over or communicating directly with any part of a building used for the storage of inflammable liquid, should be provided with exit doorways giving access to some safe position as far as practicable from the storage, and with doors hung to open in the direction of exit with only such fastenings as can be easily and immediately opened from the inside.

#### VII.—General.

(a) Proper guard rails should be provided to the routes of escape on roofs, &c., and round skylights, lantern lights and ventilating cowls on the roofs of projecting shops. (b) Clear gangways should be kept up to and between all stair-

cases, gangways and exits on all floors. (c) All escape doors should be made so as to open in the direction of exit or to swing both ways, clear of steps, landings, passageways, &c. (d) All doors usable as means of escape from both sides should swing both ways and be kept free from all fastenings. (e) All such doors must, if required to be provided with fastenings during the time persons are upon the premises, be fitted during such time with automatic bolts only. (f) In buildings other than residential buildings a portion of the upper panels of all fire-resisting doors usable as means of escape should be glazed with transparent fire-resisting glazing, and it is suggested that a portion of the upper panels of all other principal exit doors should be glazed with clear glass, the glass to be at such a height as will enable persons approaching the doors in opposite directions to see each other. (g) Windows on the floors above the ground floor facing the public way, street, thoroughfare or open space should be made to open easily at sill level to a sufficient height and width to allow a full-grown person to pass through in case of need. (h) Windows and doors affording access to external escape staircases, balconies, bridges, &c., should be marked on the inside in large letters "Exit in case of fire."

#### Theatres, Music Halls, Concert Halls, &c.

Premises to be used for music, dancing, stage plays or entertainments of a like kind are specially dealt with under the Metropolitan Management and Building Acts (Amendment) Act, 1878, and the Metropolitan Board of Works (Various Powers) Act, 1882, and special regulations relating to such premises as have been made by the Council.

### TOWN PLANNING.

A LECTURE on "Town Planning" was delivered to the members of the Ruskin Society at Queen's College, Birmingham, by Mr. Raymond Unwin, architect. He said it was true of most English towns and suburbs that the work of planning and construction has been done without imagination and without any idea of anything beyond rigid necessities. Our modern suburbs were planned in a haphazard way, and their growth governed by financial and other conditions. The idea of making a suburb beautiful was for us quite a new idea, but it was not nearly so new in other countries, and by their experience we could profit a good deal. Mr. Burns and the Government had promised that next year they would give to municipalities some powers for town planning. That these were greatly needed was proved by a recent instance in the immediate neighbourhood of Hampstead, where the municipality were powerless to prevent a large estate being laid out in the usual gridiron fashion. In a few years' time this area would probably degenerate into an absolute slum. What they wanted was the power to control such plans as these. Many Birmingham citizens, and especially Mr. Nettlefold, had worked extremely hard at this subject, and in the Harborne Tenants Society they had an excellent example of what could be accomplished by combination. These tenants societies proved there was growing up just that sense of corporate and civic life which would bring the element of beauty back to our towns again. They must set to work to provide the actual needs of the people in the most beautiful way.

Mr. Nettlefold, chairman of the Birmingham housing committee, said the lecturer had drawn attention to a most important aspect of life, namely, the enjoyment of the artistic side. It had been his (Mr. Nettlefold's) lot to have to deal with this question of town planning rather more from the business point of view. He believed they could prove town planning to be a sound business principle. Unless they could do so they would never get what they wanted in "this dear old practical country." With regard to the local experiment at Harborne, it had been praised very highly by experts in London, who gave the Harborne plans first place over a number of others. All that was now wanted was more financial support.

The Demolition of two masonry walls in the south-west tower of Dunfermline abbey nave has laid bare a beautiful clustered column, the only one of its kind in the interior, besides four masonry arches, all of which are being restored at the desire of the Crown authorities. The interior of the same tower is to be pointed and repaired to the top, a height of nearly 100 feet, and a new floor has just been laid in the bartizan tower.

### How Architects get Work.

SIR,—I should like to revert to my namesake Mr. Robert Williams's original letter of the 18th ult. with reference to obtaining work, for in the more recent amusing correspondence the main issue has been lost sight of. And though it is clear, on Mr. Williams's own showing, that his own practice is independent of "a dress coat," yet I cannot but think that his contempt for those who hold different opinions is quite uncalled for.

Is not the world large enough to admit of the possibility of several roads all converging to one point—success?

Does Mr. Williams really believe that intelligent labour is all-sufficing in these days of strenuous competition?

Let it be freely admitted that social influence is insufficient without intelligent capacity; but I have heard (on reliable authority) of a gentleman whose professional career was successful as the result of money and influence, his large amount of work being designed and superintended by the office "ghosts," and I think that many similar instances have been known. It is surely an excess of virtue (if it is a virtue) to neglect social chances. But there is even more in the question, for an architect gains great experience from the beneficial exercise of his talent by mixing with men in all walks of life.—Obediently yours,

ROBERT WILLIAMS.

3 The Parade, Abercwmheli:  
November 25, 1907.

### Egyptian Doggerel.

SIR,—Your readers are being much amused by the correspondence on "How to find a Wife," and are no doubt much impressed, as is the writer, that one member of our remunerative profession has a bath and also wears slippers. This is most interesting, for we are taught that "cleanliness is next to godliness." Good, then, "Unslipped Pantaloons," you are undoubtedly happy, for "to be good is to be happy." Oh, what bliss! no wonder you do not require a wife to cheer and comfort you. Apologising for taking up your valuable space, Mr. Editor, I am, &c.,

A BACHELOR.

London, England: November 25, 1907.

### GENERAL.

**The Death Occurred** last week of Mr. William Alexander Longmore, F.R.I.B.A., Walthamstow, at the age of 82. He was educated in the district, and at that time resided with his uncle, the late Tom Hood. For many years he was the architect to the Walthamstow School Board. He had been a member of the Honourable Artillery Company about fifty-four years. In 1892 he was elected a Fellow of the Institute.

**The Commission** which was appointed to inquire into the cause of the collapse of the great cantilever bridge over the Quebec river has issued its report. The Commission finds that the cause of the disaster was due to making a change in the original designs which, in the opinion of the Commission, materially weakened the structure.

**The Memorial** to the late Bishop of Chichester (Dr. Wilberforce) is to consist of a personal monument in Chichester Cathedral, to be designed by Mr. Somers Clarke, the cathedral architect, and of an exhibition, to be called the Wilberforce Exhibition, to be given for the purpose of assisting those desirous of entering holy orders.

**The Streets and Buildings Committee** of the York Corporation unanimously recommend the appointment of Mr. F. W. Spurr as city surveyor. Mr. Spurr was elected acting surveyor on the resignation of Mr. A. Creer last February, and prior to that time was Mr. Creer's deputy.

**A Suggestion** has been made for the purchase by the Manchester City Council of the site of the building recently destroyed by fire in Aytoun Street. The building destroyed adjoined the Minshull Street police courts, and the site would be of great value in view of a proposal to extend the accommodation of the courts.

**Mr. A. D. Price**, Local Government Board Inspector heard evidence in the City Hall, Belfast, with reference to loan of 57,332*l.* which had been applied for to execute Corporation paving works. Mr. C. E. Dyer, city accountant, gave evidence as to the existing loans and other matters. The population of the city at the last census was 349,180 and the rateable value was 1,479,000*l.* The total net debt of the city was 3,068,532*l.* 16*s.* 7*d.*, including 1,072,450*l.* 6*s.* 5*d.* sanitary loans and 1,038,000*l.* electrification of tramways. The borrowing powers of the city under the Public Health Act were 2,980,176*l.*, less the sanitary loans, the amount which he had stated. The margin of borrowing power available was 1,743,524*l.*

**The Edinburgh Dean of Guild Court** last week passed the plans for the concert hall at the Scottish National Exhibition, to be held next year in Edinburgh. The hall will form a conspicuous feature of the exhibition buildings. Externally it is square in shape, with a domical roof rising in the centre to an extreme height of 61 feet from the ground. Each side of the building is 132 feet in length and the site is convenient to the exits to Balgreen Road. There are entrances to the building on three sides. These give access to spacious crush halls, which in turn open into cloak-rooms and into the concert hall proper. On the fourth side, flanking the platform recess, are entrances to rooms for the artistes and for the choirs and bands. Internally the hall is circular in shape and is in two storeys. Seating accommodation is provided for an audience of 2,000. With the exception of the gallery, which is of steel cantilever construction, the building is of wood covered externally with fibrous plaster.

**The Fifty-first Annual General Meeting** of the Glasgow Archaeological Society was held on the 21st ult. The report said that thirty-seven members were admitted last session, including several ladies. The treasurer's statement showed that the year began with a balance of 700*l.* 2*s.* 3*d.* and ended with a balance of 818*l.* 18*s.* 6*d.* Mr. George Neilson, LL.D., was unanimously elected president and the Rev. Professor Cooper and Mr. J. T. T. Brown were re-elected vice-presidents. Mr. George M'Donald, LL.D., was elected a vice-president to fill the vacancy caused by the election to the presidency of Dr. Neilson. Lord Provost Sir William Bilsland, Dr. Thomas H. Bryce and Mr. F. J. Amours were elected members of the Council. Messrs. William George Black and A. H. Charteris were elected honorary secretaries and Mr. George J. Walker honorary treasurer.

**The St. Mary's Arch**, Dumbarton, has been removed, at the instance of the Town Council, from its site in Church Street and re-erected within the municipal grounds. The structure is one of the tower arches of St. Mary's Collegiate Church, founded in 1450 by Isabella, Duchess of Albany and Countess of Lennox. At the Reformation this church suffered the fate of many others in Scotland, and became a ruin. It was, in fact, a quarry for the townspeople for several centuries, until in 1850 the arch became "the sole remnant of a once extensive pile." In its new site it has been removed as nearly as possible to its original site, where it had stood for 400 years, before its removal was first necessitated by the advent of the railway to the town.

**The Cambridge University** authorities propose that a grant of 25*l.* be made from the Worts fund to Professor Ridgeway towards defraying the expense of making a systematic examination of one or more tumuli in Ireland, on condition that he report to the Vice-Chancellor the result of his investigations in a form that may hereafter be published by the University.

**The Late Mrs. Annie Fulton**, of Penarth, has bequeathed to Cardiff for the purpose of placing in the City Hall a large painting, a view of the "Holy Loch," Scotland, by Mr. Greenlees. Another clause in the will affecting Cardiff is as follows:—"As to one other fourth part or share of my residuary estate, I direct my trustees to stand possessed thereof upon trust, to be held and applied by my trustees in their discretion, subject to the approval of the Lord Mayor, aldermen and citizens of Cardiff, for or towards the completion and decoration of the interior of the City Hall and the purchase of paintings, statuary and other works of art."

**Mr. Edgar Dudley** held a Local Government Board inquiry on Saturday in Manchester into the application of the Manchester City Council for leave to borrow 60,500*l.* for the purchase of the Platt Hall Estate, "for the purposes of public walks and pleasure grounds."

## THE WEEK.

ident at Blackfriars Bridge becomes the more ble from the confined space in which the opera- ere carried on. With high bridges like the ridge or the Quebec Bridge it is easy to realise ssters would follow from an apparently slight or even the slipping of a part from its posi- ut at Blackfriars Bridge height seems to be of count, and the work is being executed under s which might be supposed to render the all the workmen secure. Up to the present anation has been forthcoming which is suffi- explain why a great caisson in the form el cylinder, which had been lowered without for 16 or 17 feet, should suddenly escape atrol at the moment when it had almost the water. Sir WILLIAM ARROL, the prin- ontractor, had taken the precaution to his resident engineer to examine everything e caisson was placed on the jacks. The jacks orted by four cross-girders, and it was found e of them gave way, and the fourth, although maged, had moved. It was not the mere f the caisson which injured the girders; there e been some slight motion. It has not been ther the girders were tied or braced, and the vement of one of them if they were independent e sufficient to derange the supports. Indeed, e appear from the evidence that in similar works ers should be of special sections to sustain under extraordinary conditions. There might e of material in building them, but the cons- of accidents would be diminished if not r avoided.

TE having been obtained by Sir WILLIAM at the south-east corner of Kingsway and ueen Street, he proposed to use brick in the s, but the committee of the County Council to approve of it. The subject was referred to ration of Mr. JACKSON, R.A. His award is to t that, on the question of design, the Council bject to the proposed elevation as shown on ings, but that, on the question of material, the s entitled to require that stone shall be used elevation to Kingsway, so as to secure uni- of material in the elevations of the buildings at thoroughfare. Mr. JACKSON, however, in adum to his award, deprecates the strict appli- of this restriction. The main elevations of all dings, thirteen in number, which have been on land belonging to the Council in South- Row, Kingsway, Aldwych and the Strand have are being, constructed in granite or Portland d similar materials have been, or are being, the elevations of buildings on ten sites, be- o other freeholders, in these roads. The com- mment "That Sir WILLIAM FARRER be re- use stone of a quality to be approved by the for the elevation to Kingsway of the buildings to be erected by him on a site at the south- ner of Kingsway and Great Queen Street."

INGHAM has a right to be proud of the success o Cox, who was born there in 1783. As a boy delicate; but it was expected that he would be assist in some of the local trades, and accord- was apprenticed to a painter of lockets. Then initiated into the mysteries of scene-painting, travelled with strolling companies until in his h year he was engaged at Astley's. It was to ARLEY that he was indebted for instruction in

water-colours, and in course of time gained a reputa- tion. Cox undoubtedly possessed a style of his own. His experience in theatres made him neglectful of detail, and he therefore preferred subjects to which his breadth of handling was suited. It never could be said, however, that he sought after theatrical effects. Nature under his hand appears simple and yet grand. Another characteristic is the correspondence which exists between his skies and the scenes below. Birming- ham possesses several of his drawings, and they always seem to have votaries in front of them. It is satisfactory to be able to record that some local amateurs have subscribed and purchased 105 drawings and studies in water-colour, charcoal and pencil by DAVID Cox, and have presented them to the art gallery in Birmingham. It was explained that although Cox is already well represented in the gallery as regards his paintings, only a few of his drawings have found a place there, and those presented have been ac- quired in the hope that they may be an acceptable addition to the permanent collection, and may lead to the formation of such a large and thoroughly represen- tative collection of Cox drawings as the public gallery of his native city ought to possess. It is needless to say the drawings were accepted with pleasure, and that a vote of thanks by the Council was offered to the generous donors.

THE meeting of the National Trust for the Pre- servation of Places of Historic Interest or Natural Beauty, which was held on Friday last, was the first demonstration that the Act of the last Session had been acted on. The Society has now a partly public character, and can acquire by purchase or otherwise, and maintain or manage, open spaces, buildings and other property. But although a statutory body the Trust has not yet sufficient power to prevent the destruction of such a building as Crosby Hall. The Council has acquired Barrington Court, a fine Somerset house, although all the purchase-money has not been paid. Another property is the fifteenth-century gatehouse at Westbury College. If funds were forth- coming the Trust could have also a Roman villa in Gloucestershire and the Roman pavement at a farm- house at Bognor, which is the finest example of its class in England. Land has also been presented by Mr. CHARLES ROTHSCHILD and Mrs. RICHARDSON-EVANS. H.R.H. the Princess LOUISE has accepted the presi- dency of the Trust, and under the new conditions much may be done. But whatever may be the success in the future the services rendered by the members during the last twelve years should not be forgotten.

THE execution of work by the employés of a Corporation does not find much favour in the eyes of Mr. F. H. TULLOCH, the inspector of the Local Govern- ment Board. He held an inquiry at Sheffield on Tuesday in which authority to raise a loan was sought for replacing some of the old rubble sewers in the city, of which some 40 miles still exist. When he was informed that it was proposed to carry out the work by the Corporation staff the inspector urged that it would be preferable to have the work done by a contractor. Much, of course, depended on the contractor as well as on the supervision and specification. But on the part of the Council it was asserted that their experience of contracts did not warrant them to try the system again. The inspector maintained that with a contractor the joints would have to be properly made underneath, and moreover it was not a good practice to follow only one method of executing works. The representatives of the Council and their officers did not appear to be con- vinced, especially as in one experiment it was found that 16,000*l.* or 17,000*l.* had to be paid after it was supposed the contract was finished.

## THE INFLUENCE OF SIR WALTER SCOTT.

IN the course of the eloquent address which the ex-Cabinet Minister, Mr. GEORGE WYNDHAM, M.P., delivered on Friday at the annual dinner of the Edinburgh Sir Walter Scott Club, he said:—"He (SCOTT) produced a pure stream of literary energy, and that stream flowed for fifty years and more, turning the mills of many movements even outside literature; of the Oxford Movement in religion; the young England movement in politics and the MORRIS-ROSSETTI movement in art. The words do not directly suggest that SCOTT exercised any influence on architecture. As a lover of the belles-lettres, Mr. WYNDHAM, we suppose, was indifferent to that art, and did not care to make any special mention of it. But the Oxford Movement was closely connected with Gothic architecture. MORRIS was trained in a Gothic architect's office, and ROSSETTI possessed as much of the Gothic spirit as was possible with an Italian. It is easy for a rhetorician to go through a great variety of evolutions and to make them attractive because he is not possessed of a clue. Mr. WYNDHAM would have improved the quality of his discourse, if not its interest, if he had definitely recognised that SCOTT was a Gothicism, and that those who were most successful in imitating him were Gothicismists also.

SCOTT was born in 1771. It was his pride to have belonged to the family of the SCOTTS of Harden, who were typical Borderers. He was fascinated with feudalism, and the cause of the terrible mental sufferings which he heroically endured for sixteen years—or over a quarter of his life—arose simply from his desire to make himself a great representative of feudalism under modern conditions. In his youth he was very delicate, and he was sent to a farmhouse in the hope that he might attain ordinary strength. There he acquired a knowledge of ancient legends and ballads which determined the character of his life. When he became strong enough he was sent to the High School of Edinburgh and then to the University. In an academical sense he was not successful. In his fifteenth year he became an apprentice in his father's office, and after six years' clerkship he was called to the Bar. He was too shrewd a man to believe he would become prominent as an advocate, and when he was twenty-eight he accepted the appointment of Sheriff Depute, and in course of time he was advanced to the more important office of Clerk to the Court of Session.

The condition of SCOTT's childhood made him an archæologist, although at first it was displayed only in collecting old ballads and other poems. His predilections were with the past, and neither then nor afterwards did he assume, like the majority of scholars, any passion for the classics either in literature or in art. He stood therefore somewhat apart in the society of the Modern Athens. It is also remarkable that his first experiments in literary composition which he thought worth publishing were ballads from the German. He had tried as a schoolboy to write like others. But he felt mortified at the inferiority of his compositions. Once he met with a little approval, but he never forgave the apothecary's wife who detected his verses as copies from an old magazine. He found something akin to his own thoughts in the ballads of BURGER and GOETHE. Germany was then endeavouring to emancipate itself from the French and Classic influence, and it might be said that SCOTT's ambition was of a similar kind. He next attempted a translation of GOETHE's drama, "Goetz of the Iron Hand," and a few years afterwards he had the courage to issue the first volume of his "Border Minstrelsy." When that collection was completed he published an edition of the old poem "Sir Tristram." Then in 1805, when he was in his thirty-fourth year, he startled the world by his "Lay of the Last Minstrel," which, as he said, was intended to illustrate the manners and customs which anciently prevailed on the borders of

England and Scotland. Although appreciated by the public it compelled solicitors and others to look upon SCOTT as not adapted for legal work, and in consequence to trust to literature for a part of his income. PITT took interest in him and was desirous to aid him, but he died before he could render substantial service to SCOTT. "Marmion" and "Lady of the Lake," the two poems which were accordingly adapted to the requirements of the market, while preserving old world characters.

The facts we have related are no doubt familiar to our readers. We mention them because the evidence that at one time of his life SCOTT ran great risks by his devotion to the past. That past was to him something indefinite, like a hazy atmosphere, which by contrast gave more effect to his descriptions of Buildings were considered a necessary part of his pictures. It was in the "The Lay" that a description of Melrose by the pale moonlight first appeared. The verses did more to revive an interest in the past than many a learned treatise. But in that and other poems castles, and abbeys were introduced with a boldness which must have horrified all those who believed in the supremacy of classical rules. The serious blots in MILTON's great poem were supplied by the introduction of technical terms. A great deal of the charm of SCOTT arises from the use of the words of architects and masons. By that means he gains a precision which was afterwards imitated by writers in prose as well as poetry. Purists must have been horrified when they found SCOTT expressing himself in the following words when addressing Castle:—

Oft have I trac'd, within thy fort,  
Of mouldering shields the mystic sense.  
Scutcheons of honour, or pretence,  
Quarter'd in old armorial sort,  
Remains of rude magnificence;  
Nor wholly yet had time defaced  
Thy lordly gallery fair;  
Nor yet the stony cord unbrac'd,  
Whose twisted knots, with roses lac'd,  
Adorn thy ruined stair.  
Still rises unimpair'd below,  
The courtyard's graceful portico;  
Above its cornice, row and row  
Of fair hewn facets richly show  
Their pointed diamond form.

The Gothic of SCOTT, although it was in some respects amateurism, was very different to the Gothic as described by WALPOLE and BECKFORD, or which arose from the mental vision of poets like GRAY, WARTON and others. If SCOTT imagined he was erecting a Gothic building when he undertook to raise Abbotsford, he was in error. But he was not the first writer who realised his aspirations in building.

There can, however, be no doubt that he was the impulse which afterwards covered England with many churches and mansions which were all supposed to be Gothic, however much they might differ. Let anyone look at the proceedings of the ecclesiastical societies during a great number of years, and he will find the one subject is the Gothic church. The man who represented the philosophy of the Oxford Movement, considered that Gothic was endowed with a profound and commanding beauty that probably the Church will never see it surpassed until the City is reached. He testifies to the influence of SCOTT exercised on the movement.

It would be difficult to estimate how much the French Romantics owed to Sir WALTER SCOTT. At a time when classic subjects held possession of the theatre in Paris, a revolt began with Victor Hugo's "Hernani." It could be described as belonging to the Renaissance rather than to the Gothic period. His "Notre-Dame de Paris" the principal Gothic building of France not only supplied the title, but was closely connected with the incidents that it

ered one of the characters. HUGO was a poet of moods, and could not be expected to be always one style; but his able henchman, THEOPHILE, continued for years to display mannerisms he took to be characteristic of SCOTT. That fine "Captain Fracasse," abounds in descriptions of gowns, furniture, tapestry and other properties. When he went GAUTIER was attracted by a love of and in employing technical terms he went beyond for those which originated centuries ago, which no longer used by workmen, were introduced as the everyday language of the nineteenth century. He imagined that GAUTIER was a pedant; but he was simply faithful to the old belief of the Romantics, words which were accepted at an earlier time, even when used by the Academy, could be fittingly employed in describing the life of a past age. Other writers of the school adopted a similar practice, although their vocabulary was not so rich in antique terms as that of the "Les Grotesques." But the greatest tribute to SCOTT was rendered by AUGUSTINE THIERRY, who declared that the more real history in the Waverley novels than in the compilations which bore that name; and his efforts were endeavours to represent English life in some of the animation of SCOTT, but without the effort to utilise imagination where documentary evidence was not forthcoming.

The Romantic spirit revived the admiration for architecture in France. The Renaissance style, which was strengthened by the classicism of Louis XIV., for a time was eclipsed. Queen AMELIA had won to give her patronage to the Mediæval style, and in consequence many Gothic churches were restored. A special department was created for the protection of ancient monuments; but for several years the Government should have signified the protection of Mediæval architecture. In course of time the Romantic spirit died and then died out, and it was succeeded by one of a very different character, in which there is so much evidence it would be hard to fix a definite name. Mr. WYNDHAM would call it Realism, and would have SCOTT recognised as partly inspiring it, but there is a difference between SCOTT's realism and that of the Frenchmen. The orator told the story of the Venetian tradesman who pointed out the bust of "le grand maître" as the portrait of "l'homme le plus célèbre en l'Europe," and there can be no question that the words were at one time applicable. He helped to create a fashion in architecture which produced some of the most successful results in England and on the Continent. The extraordinary fact remains that his "own town," to which he attracted men from many other cities, was less fascinated by his spirit than other cities. The image of SCOTT appears in a Gothic shrine, and the most important buildings of the city are examples of Classic with which he could have no connection and could not take pleasure in any of its forms.

## CLASSIC ARCHITECTURE.\*

COMPLAINT was lately made by Dr. WILHELM BODE, who is supreme in the museum world of Germany, about the devotion of his countrymen to Classic architecture. Modern theories respecting it, according to him, are based on German conclusions, and during half a century at least no civilised country has fostered that element of knowledge with as much care as the Germans. Classicism naturally led to Italian art, and the way Northern art was neglected. It is, of course, easy to read between the lines. Dr. BODE is proud of what has been done by explorers and architects, and he would soon find room for noble

examples of Classic or Renaissance art among his collections. His own handbooks are evidence of his appreciation of ancient work. But as a patriot he considers that examples of all varieties of the old German arts should be highly prized.

Students of architecture throughout the world have reason to be grateful to the Germans, who in their turn might sing, "All honour be paid to the lowly spade." SCHLIEMANN and DÖRPFELD by its aid were able to revolutionise our ideas about Greek planning. When FERGUSSON made a plan of the Erechtheum which corresponded with the description of PAUSANIAS, clever men despised it because, as they said, it was not a Greek plan. What was supposed to be a Greek plan was simply one of a rectangular temple. But so firm a hold had it gained on the minds of architects and archaeologists, they concluded that the Greeks were always rectangular in their planning as in their elevations. The plan of the palace at Tiryns was enough to reveal that, when occasion demanded it, the Greeks adopted a most complicated arrangement for their buildings. What is true of Tiryns is no less applicable apparently to the Palace of Knossos, if one can judge from the portion revealed by Dr. ARTHUR EVANS. When the first edition of "The Architecture of Greece and Rome" was brought out, Dr. EVANS's name was not mentioned in it. In the second edition just issued an abstract is given of his discoveries in Crete.

The German people are made acquainted with the progress of explorations by their countrymen with as much regularity as they learn about Court news, or the vacancies in public departments, or the movements of troops. In this country, unfortunately, similar work is carried out at the expense of subscribers, and in general they prefer to keep any knowledge which is gained to themselves. It is only on the occasions when further aid is sought that specimens are exhibited or paragraphs issued to show that the explorers have not been idle. With such a volume as that by Messrs. ANDERSON and PHENÈ SPIERS to serve as a ground, it would be comparatively easy to give the bearings of any discoveries which may be made. What has been done in the second edition by Mr. PHENÈ SPIERS is enough to prove the feasibility of having an English book which as respects Classic architecture embodies the latest researches.

As we have said, an abstract is included of the important work which Dr. ARTHUR EVANS is carrying out single-handed in Crete. One of the most important revelations was that a staircase existed which led through two storeys and which, so far as is known, is unique. Concerning other remains Mr. PHENÈ SPIERS writes:—

Among other valuable architectural discoveries are the bases of columns of cypress wood found in various parts of the palace. Still more important is the fact that from the charred ends in the council chamber, and impressed moulds in other places, Dr. Evans has been able to reproduce some of the columns themselves. For the echinus of the capital, which was probably of stucco; he has had to depend on what is called the *Temple fresco*, a painting found on one of the walls. It represents three temples, the middle one distyle in-antis, and raised above the others, which have but one column in-antis. The latter peculiarity is proved to be no mere convention by the single base found in the entrance portico in the propylæa, and in the portico to the throne-room, besides similar instances found at Phæstus. The column thus restored tapers downwards, the diminution being about one-seventh. The abacus had great projection; and in the staircase court, where it had to carry the superstructure and the cross beams of the upper floor, it was 3 feet 5 inches square. It would seem that the Cretan architects had recognised that the trunk of a tree was equally capable of carrying weight, whether in its natural position or inverted, and that when employed in the latter position the rain would more readily fall off it, and thus tend to its better preservation. It has the further advantage that, with its greater diameter at the top, an increased support was given to the abacus. Other paintings and porcelain mosaic slabs found in the ruins suggest that the upper part of the walls was built of unburnt brick

\* *The Architecture of Greece and Rome. A Sketch of its Development for the Use of Students and Others.* By J. Anderson and R. Phenè Spiers. Second Edition, and much enlarged. (London: B. T. Batsford.)

or rubble masonry with clay mortar, and enclosed in timber framing, above which appeared circular discs, which may have been the ends of logs of wood supporting a floor or roof. Two other decorative fragments were found—a triglyph frieze, and portions of the architrave of the doorway of the propylæa, the former similar to examples found at Mycenæ, and the latter, with its rosaces and the undulating lines enclosing them, being identical with those on the architecture and lintel of a door in one of the tombs there.

The tapering column was long thought to be a peculiarity of the Lions' Gate at Mycenæ. But evidently it was used elsewhere. In the former edition the restoration of the tomb of AGAMEMNON was adopted from the restoration by PERROT and CHIEPIEZ. The gift of the two half-columns by the Marquis of SLIGO, which are now in the British Museum, has enabled Mr. PHENÉ SPIERS to produce a restoration of the entrance to the tomb which is of a different character, and one that seems more probable. The lions and the tapered column are introduced above in a triangular enclosure, as if they formed the armorial bearings of the king.

It is not to be supposed that the portion relating to Knossos and Mycenæ is the only alteration. Other parts of the chapters relating to the archaic period have been likewise revised and altered wherever necessary. The introduction of plans of the early temples is also advantageous. In other parts of the book the same care is taken, although it may not be apparent at first sight. The remodelling is so extensive it would be difficult to give an account of it in our limited space. For instance, in the description of the Parthenon there are additions relating to the subtle curves which were employed in the building, although elsewhere segmental and others easily obtained were made to serve.

The frontispiece in the second edition is a reproduction of a drawing by DEERING-GANDY which is now in the Soane Museum, and is supposed to suggest the sanctuary at Eleusis. There are no actual remains of the building, but it probably resembled the Temple of Apollo at Bassæ, from which COCKERELL derived the type of Ionic capital which he preferred.

With works of the kind few authors care to undertake a revision which will necessitate any sacrifice of the labours of a former time, and the composition of new matter is commonly overlooked. Mr. PHENÉ SPIERS has not shirked operating in both ways. The new volume on "The Architecture of Greece and Rome" is accordingly an improvement on its predecessor, and can be recommended to those who are studying ancient architecture as the basis of modern styles, or from its connection with Greek and Roman life. There are other styles, but none have so long held their ground or are likely to be more influential in the future. On that account this "sketch," as it is modestly called, deserves to be more carefully studied than works on the other styles, owing not only to the inherent interest of the subject but also on account of its manifold relations.

#### THE HOUSING PROBLEM.\*

**A**MONG all the sanitary problems there is not one which is more difficult to solve than the housing of the humbler classes. In the first place, the respect for property is sufficiently strong to prevent the taking of extraordinary measures for the demolition of houses which are unfit for habitation, or for compulsory purchase of them at prices below their market value. A still greater obstacle, perhaps, is to be found in the power of selfishness, which prevents one class of people from expending money for the benefit of

another class. It is easy to believe that a number of those who live in slums could, if the industrious and sober, afford to rent rooms in the better class. Their misery is looked on by the wealthy as if it should be a spur to exertion. It is not sufficiently realised that insalubrious quarters enable diseases to increase in intensity at last the occupants of the most costly houses become victims to them. But fear of contagion unquestionably exercised sufficient influence to bring about a great change. The extent of it can be seen by comparing Alderman THOMPSON'S "Handbook" which was issued in 1903, and the supplement which has now appeared.

In the first paragraph he is able to admit that although much remains to be done, yet "overcrowding has decreased; a smaller number of persons are found in one-room dwellings; the number of persons per house is slowly but surely growing less; some of the most insanitary of the old slums have been cleared or improved, with liberal provision of better and cheaper transit, especially by electric tramways and electric trains, has encouraged the dispersion of the population from some of the crowded centres." Much more would have been accomplished if the Legislature as well as individuals were able to realise that the lives of human beings are at stake, and that arrangements for their present needs need not necessarily be uniform with those which prevail in ordinary trading. Many owners of land make no difference between the offers of sanitary authorities and those of railway companies. There is no fund existing from which money can be obtained on terms suited to the circumstances of the case, and by-laws generally insist on methods which are costly. Benevolence finds other channels for its efforts, and improvements in house-building are easily taken up by individuals to return a profit on the outlay which will compare with interest on railway shares. It is not therefore surprising that improvements, as shown in some of the illustrations to Mr. Alderman THOMPSON'S book, as in Birmingham, are not always suggestive of a transformation of the removal of a few houses or other obstacles, although it may appear of little account to lovers of the picturesque, has an important meaning to people who have to live in such districts. The difficulty of acquiring property is suggested by an experiment in Notting Dale, Kensington. The general death rate was 49.5. It could not be announced that an improvement was contemplated, or the value of the hovels would ascend. A fund was advanced on the personal responsibility of the Mayor. Leasehold ground rent was purchased at 200*l.* per house. But when it was found that a public work was about to be undertaken, the others rose to 300*l.* The alterations were carried out in some cases for 60*l.* per room, and in other cases cost 129*l.* In one respect the scheme was a success. Out of 350 tenants who were rehoused in comfortable flats, 84 had lived in the houses in their primitive state, which shows that some people prefer to vegetate in unsatisfactory surroundings.

In England 5,900 block dwellings have been erected since 1903; more than three-fourths belong to London, and four-fifths of the rooms. Very few additional block dwellings, says Mr. THOMPSON, have been erected in English towns. He calculates "that a week's wages are required to pay a month's rent in municipal block dwellings, except in Scotland, where the workman spends a smaller part of his income for house room than the English workman, by the simple expedient of acquiring a smaller number of rooms in his dwelling." Old-fashioned flats and cottages appear of late years to find favour with the working classes. Of the last those costing 150*l.* and under are, we learn, fast becoming a respectable total.

It is shown that the effects of the County Council housing experiments in London are that the death rate has fallen 30 per cent. in seventeen years, and that

\* *Housing Up-to-Date* (companion volume to *The Housing Handbook*). By Alderman W. Thompson, chairman National Housing Reform Council. A practical manual giving the latest facts and figures. (Published by the National Housing Reform Council, 432 West Strand; W. Thompson, Richmond; and P. S. King & Son, Westminster.)

100 extra lives were saved in 1905 as compared with 1900. The interest on sinking fund of all the billings amounts to 47.86 per cent. of the gross bill, and the working expenses to 40.23 per cent. In 1894 to March 1906 "a sum of 56,882*l.* has been temporarily defrayed out of the rates, of which a sum of 7,798*l.* has already been repaid out of revenue, leaving a net contribution from the rates of 39,084*l.*, owing mainly to the fact that during the time the houses are being erected, and before any rent can be received from them, the expenditure is bearing interest and brings back no return."

Liverpool is making most creditable efforts to overcome the housing difficulty, which used to be exhibited in some of its worst forms in that city. Nearly 5,000 houses have been provided by the Corporation. No less than 8,000 houses had to be removed; the clearance or purchase of land cost about 500,000*l.* and building cost 1,000*l.* In the Hornbury Street area the cost of building has averaged about 65*l.* per room, which is equivalent to 10*s.* per square foot of floor area, or 56*l.* per cubic foot of room space. The floors are constructed of small steel joists and coke-breeze concrete, and the flooring-boards are nailed direct. The Corporation buildings do not appear to have interfered with ordinary enterprise, especially in the suburbs. Descriptions are also given of what has been done by private effort and co-operative societies throughout the city. When another supplement is published by ALDERMAN THOMPSON, it will no doubt be possible to include details of the Sutton Housing Trust. Apparently, the testator desired was to provide houses for the best class that can contrive to pay a rent, however

examples are given from some of the cottage exhibitions. In several towns municipal cottages have been erected, some for less than 150*l.* each, while others are slightly in excess. Alderman THOMPSON has something to say concerning town development, a subject that may be discussed in the next Parliamentary session. He considers that new styles of streets are required, and he refers as an instance to Earswick village, where the macadamised roadway, only 12 feet wide, is bordered by strips of grass 6 feet wide on each side, leaving a simple path. There is consequently a width of 24 feet between the cottages. As they are let at 18*l.* a year, the outlay on an ordinary 40-foot road could never be recouped.

In addition to the information concerning the English housing problem, the volume contains a very interesting part of the volume devoted to foreign practice, which is carried out sometimes by the municipalities, sometimes by the police department. It cannot be said that more facilities exist than in England. Where there is compulsory purchase the cost is fixed by tribunals or experts. In Paris no street is to be less than 12 metres wide. In Italy the works for working-class houses are carried out by the municipality. The advances by the State, it is difficult to say, are small when compared with England. London at present is apparently more crowded than any other city at its worst; 43 per cent. of the population live in dwellings of one room, or a room and a kitchen. For every fifth to one-sixth of the population one or two rooms have to accommodate from six to more than ten persons. The greater number of the working classes live a nomadic life, for a fourth of the people are liable to be turned out at a fortnight's notice.

Buildings which have to be erected on the cheapest sites do not afford opportunities for the display of architectural art. In the smaller houses and cottages efforts are occasionally made to avoid the monotony which for so long has been the characteristic of expensive houses in the crowded and unlovely streets of London. It may not be profitable for an architect to devote so much labour to humble work, and what is seen in some cottage settlements is a public recognition for skill in producing pleasing results under difficult conditions.

"Housing Up-to-Date" truly suggests the character

of Alderman THOMPSON's supplementary volume. As a pioneer he has become acquainted with all the difficulties of the subject, and there is no official publication from which a tithe of the information to be found in his pages can be obtained. It is difficult to estimate the utility of such a guide-book to those who desire to initiate or to aid in improvement schemes.

## WHITEHALL PALACE.

A LECTURE was given at the Royal United Service Institution by Canon Edgar Sheppard, sub-dean of His Majesty's Chapels Royal, on "Whitehall Palace and the Site of the Execution of Charles I." Whitehall, he said, was a term still associated with all the Royal palaces in England, as well as with many old castles, and, historically, with the place of assembly for peers in Parliament. In the case, however, of the Royal Palace of Whitehall, the title had been, so to speak, specialised. What was once York House had since the days of Henry VIII. enjoyed the proud distinction of being the Whitehall of all the palaces. The palace was erected on a site originally occupied by a large mansion built in the year 1240 by Hubert, or Hugo de Burgh, Earl of Kent, and it came into the possession of the Preaching or Black Friars. In 1248 they sold the palace to Walter de Grey, Archbishop of York, who died in 1255, and from that time until the fall of Cardinal Wolsey—a period of nearly three centuries—it was the London residence of the occupants of the see of York, thirty of whom dwelt there in their official capacity. The building was accordingly known during that period as York House. It was during the residence of Cardinal Wolsey that York Place began to be invested with that splendour which was usually associated in our minds with the word palace. Wolsey was the last archbishop who occupied York House. Upon his disgrace in 1529 it was delivered to the king by charter, and in the summer of 1536 another Act was passed which annexed it to the ancient Palace of Westminster, whereupon, according to Brayley, the king changed the name and called it the King's Manor of Westminster and no more York Place. The acquisition was a very convenient one, for not only had the old palace of the king—in the Palace Yard at Westminster—fallen into decay and ruin, but the Court was without any residence in that quarter at that time, where its seat was usually held. In Whitehall then—after various alterations and buildings had been completed—the king fixed his Royal residence, and it was the dwelling-place of his successors till the disastrous fire in 1698. The Royal mansion extended, so we were told, from Scotland Yard on the north to Cannon Row and the top of Downing Street on the south, and east and west from the Thames to St. James's Park. Very little was done to improve it in the reigns of Edward VI., Mary I. and Elizabeth. It had fallen into a dilapidated condition in the time of James I., and the king thought it desirable to rebuild it on a magnificent scale. For this purpose he secured the services of Inigo Jones, but the only part of the plan that was carried out was the Banqueting House, a circumstance owing, it was stated, to the immense extravagance of the Court. With the fall of the House of Stuart the old Palace of Whitehall ceased practically to exist. The Banqueting House, or Hall, was the only important portion of this famous palace that now existed. There was no building in London more sentimentally and historically connected with the life of the nation, and it was strange to reflect upon the various uses to which it had been put in the course of its existence. Installations, masques and other ceremonies had from time to time taken place within its walls. In the reign of Charles II. it was the scene of a sale of the famous collection of pictures of the Duke of Mantua. Upon the accession of George I. it was converted into a Chapel Royal, though never consecrated, and was used as such for the performance of Divine service till the autumn of the year 1890, when it was lent by Queen Victoria to the Royal United Service Institution. The Banqueting House was completed within the space of three years at a cost of 14,940*l.* 4*s.* It was part of a design intended to cover a space of 1,152 feet by 874 feet, and it was the only portion of King James's vast scheme for rebuilding Whitehall Palace which was ever carried out. The chief point of interest in the interior of the building was the ceiling, for which Charles I. at the beginning of his reign in 1630 invoked the services of Rubens, who had been sent to England by

the Infanta Isabella as ambassador from Flanders. Rubens was paid 3,000*l.* for the work, in which, according to Sir Godfrey Kneller, he was assisted by Jordaens. The sketches were made in England, probably upon the spot, but the actual painting was executed and completed in Antwerp in the year 1635. It was a fact, as interesting to learn as it was tantalising to reflect upon, that Charles I. was in treaty with Vandyke to paint on the walls of this chapel the history of the Order of the Garter, but death prevented that artist from entering on his task, as the outbreak of the Civil War would have prevented him from completing it or being paid for it had he lived. After describing the gateways of the palace and other features, Canon Sheppard quoted the views held by various authorities on the subject of the site of the execution of Charles I., also Lord Beaconsfield's advice to a lad, "Never ask who wrote the 'Letters of Junius' or on which side of Whitehall Charles I. was beheaded, or you will be considered a bore." The lecturer examined in detail points in dispute as to the position of the scaffold and the access to it. Summing up the results towards which conflicting views tended, and supporting himself by the evidence set forth by the late Sir Reginald Palgrave in his letter to the *Times*, May 17, 1890, he inclined to the view that the king was executed under the second or third window in the open street facing the Horse Guards, and that the window from which he stepped on to the scaffold was in a small building abutting on the north side of the present Banqueting House. Herbert in his "Memoirs" said:—"The king was led along all the galleries and Banqueting House, and there was a passage broken through the wall by which the king passed to the scaffold." Mr. B. E. Sargeaunt had found that at the north end of the hall the brickwork was only a foot thick, and his idea was that access to the scaffold was at that point.

#### EDINBURGH ARTS AND CRAFTS CLUB.

AFTER a lapse of three years, another exhibition of the Edinburgh Arts and Crafts Club in the Lower Dean Studio, Belford Road, was opened by Sir Rowand Anderson. Having declared the exhibition open, he said:—"Since the establishment of the Club in 1898 their work had been progressing in character and scope. It was carried on on true lines, and would in time bring about a wider and more catholic view of what art was, because the more it was known the better it would be appreciated. While they were doing good work, they had much still to accomplish, and they had one or two serious obstacles in their path. One of these was the blighting influence of machinery, and capitalists using it to produce the false and the untrue for no love of art, but for the sole purpose of personal profit. He was not going to condemn machinery as an unmixed evil—far from it. Without machinery and exact science we never could subdue nature and ameliorate life as we were now doing. What he objected to was capital using machinery to supply the uneducated masses, high and low, with the spurious and the false. That phase of commercialism was like a great octopus; as soon as the cultured few showed their appreciation of anything that was really good, its long tentacles would seize on it, and the market would be flooded with cheap and spurious imitations. In doing that the public taste was warped and degraded, until it had culminated in the falsification and the adulteration of almost everything that was made. Another obstacle to their progress was the overpowering influence of the picture painter. He alone was talked of and written about as an artist, and art literature was almost exclusively confined to picture painting. Painting and sculpture had been too much dissociated from the constructive arts. A sculptor was only recognised as such if he could make white marble busts or figures, a material unfit for our climate, and generally out of harmony with its surroundings. Sculpture could never flourish as it once did until it was intimately associated with architecture and executed in the stone of the building, and not in marble. The same might be said of some of the other arts—for example, stained glass. The custom of calling in a picture painter as an arbiter and adviser was responsible for most of the bad glass we saw about us, and all but a few windows were merely transparent pictures. Even architecture had suffered from the same cause. When plans of buildings had to be submitted to the Town Council, it was always a picture painter who was called in to guide and advise them, and as the only thing he could speak about was the sky-line and the so-called grouping of the masses,

the essentials and fitness of a building were overlooked, and in one case that he knew of the plans had, from defect in these essentials, to be withdrawn, although the sky-line had been blessed by the picture painter and the Council had meekly accepted his verdict. But he must not unmagnify these obstacles. There were now signs of better times, and a truer and sounder knowledge and appreciation of art prevailing everywhere. They must always let material and the purpose dominate the design, and the personality of the designer should always be seen in it, as was in a workshop like that, where the arts and the crafts were combined in one individual, as it should be, that the traditions of true art could be recovered. In his opinion the admirable work which they had produced in many departments had vindicated their title to be looked upon and recognised as artists in the fullest sense of the word.

#### ARCHITECTURE IN CARLISLE.

THE opening lecture of the session of the Cumberland and Westmorland Society of Arts and Crafts, on "The Rise and Progress of Architecture in the Diocese of Carlisle," was given by Mr. J. H. Martindale, F.R.I.B.A., in the gallery of Tullie House. The Bishop of Barrow presided, and there was a fair attendance.

The Chairman, in opening the proceedings, said that the architecture of Cumberland was a very interesting subject, for in many respects it had different qualities from the architecture of other counties. Cumberland stood by itself as a border county, and in many respects that fact had modified its architecture. The manor-house which was met with in more peaceful counties in Cumberland took the form of the pele tower or fortified tower more or less; even in church architecture they found that it had been modified also in that way, many of the churches having really the little fortresses of the village in which the parishioners might take refuge in time of danger. They had many interesting churches close to them. The architecture of Warwick, for instance, was a puzzle. The end of it really looked off the line, but if they looked at it they would see that it seemed to have been fortified as if it had been the stronghold of the village, the windows were so narrow and the walls sloping just like the lower wall of a tower. Then there was that interesting church at Bolton which looked as if it had been taken up out of Touraine and dropped down in the middle of Cumberland. It looked as if some Cumberland squire during the time of the French wars had followed his sovereign to that country and brought some builder from France to build that church at Bolton.

Mr. Martindale in the course of his lecture, which was illustrated with numerous slides of old churches, abbeys, castles, &c., according to the *Carlisle Journal*, said that except for the excellent work done by the Cumberland and Westmorland Antiquarian Society very little had been written about the architecture of the two counties. He mentioned in his "Styles of Architecture" enumerated a few of their ancient churches and fewer domestic buildings. Geographical position and geological formation had always influenced architecture, therefore in Cumberland and Westmorland, being Border counties with extended seaboard and on the more ancient rock strata, they found the influences at play. Roman, Saxon, Dane, together with the "canny Scot," had for the last 2,000 years contended for their beautiful hills and lakes and had made them a battlefield of clans, with the inevitable result that traces of the strife were left on the people of the two counties in their architecture. In dealing with the buildings in the northern counties they had two very important considerations to make. First, that all architecture in the North was some twenty, thirty or even fifty years later in date than in the South, and therefore the changes in style or new features required some years before they were published in the architectural journals of Cumberland and Westmorland; and secondly, that the native sturdy independence and contempt for rule and fashion were shown by the archaic-looking certain features in almost all periods. The ecclesiastical architecture of the diocese had a distinctive type and style of its own. Owing in a great measure to the hard and unyielding nature of their building stone generally the churches were small and unassuming, consisting of a nave, chancel and bellcot in place of a tower, or with a very small tower. They had comparatively few large towers and fewer Mediæval spires. They saw none of the magnificent west end types of Somerset towers and East Anglian spires in the district, but had a unique example of a central tower

rtmel. On the other hand, if they had none of the s mentioned they had a number of small whitewashed hes in the diocese which were beautiful objects in the cape. They had very few striking examples of the rated and Perpendicular periods, with the exception he choir in the cathedral, Cartmel, Greystoke, portions of Kirkby Stephen, Brigham and Kendal. eature of all others which struck every observer and even the name to the style of the fourteenth century, ie geometrical tracery in the windows, was superbly sented in the east window of Carlisle Cathedral, rsally acknowledged the most beautiful window of its n England. Old churches were seldom taken down, llarged, and the builders always tried to arrange for e during the alterations, and to that principle they the historical interest and much of the beauty of their hes. In all their churches most striking details might und, and many of them had been ably treated by i Bower in his papers on piscine and effigies, brasses nural decorations in the diocese. There was an ous fund of interesting information in most of churches. Of the 164 churches in Cumberland alone fifty-six were ancient buildings, retaining main walls iginal divisions of plan, and between forty and ore were rebuildings on ancient sites, and had ents in the shape of old details, stones and fittings orated in the present structures. The lecturer also with military and domestic architecture from the time : Saxons, and especially with the period succeeding nquest. He exhibited slides of Carlisle, Naworth and castles, including Highhead before it underwent ion by Judge Hills, and described their leading es. The castles of about the period of the Conquest of two types, those with the shell keep and those with ctangular keep. The best kind of shell keep was at rmouth, and Carlisle, Brougham and Appleby were xamples of the rectangular type. He quoted an sting account of the state of the defences of the h border written in the time of Queen Elizabeth. astles mentioned in the account were Bewcastle, a of great defence; Rowcliff, Carlisle, "a place of respect"; Drumburgh, "neither castle nor tower, ouse of convenient strength and defence"; Bowness :or Tower belonging to the parsonage, "adjoining to a crick which divideth the English and Scotch s"; and "Woulstre Castle," which was described as t about "four houres boting over the sea crick to nd."

### CROSBY HALL.

E local government, records and museums com- mittee of the London County Council have prepared following report:—

e regret to report that we have ascertained that the ations of the Crosby Hall Preservation Committee been unsuccessful, and that there is danger of ition commencing almost immediately. In these cir- ances we have considered whether, all other ours having failed, it would be possible for the il, as a last resort, to make an effort to preserve Crosby Hall. After much consideration we are prepared mit to the Council a scheme which appears to us well ted to bring about the desired result. It will be remembered that a sum of about 60,000*l.* has y been subscribed towards the preservation of the nd there are indications that this amount would be sed if there were a real chance of success. If the eferred to were transferred to the Council, the Council be enabled to purchase the whole site, including Crosby Hall, at its fair market value, and would at the same e in a position to offer great inducement to a tenant : the surplus site and use the hall for such purposes would be available for under agreement with the il. The consideration to be paid need only be suf- to cover the cost to the Council involved in the pay- of interest on, and repayment of, the purchase money 0,000*l.*, and the amount of interest and repayment decrease yearly until it was extinguished in sixty time. Under such an arrangement no charge would on the county rate.

e cannot help feeling that the bank would not wish to in the way of the Council acquiring the site on these it being understood that the first proposal for the use hall should be made to the bank. The bank would, the terms rendered possible by the Council's inter-

vention, be able to secure the surplus site at no higher price than they have paid for it, and to rent the hall at a consid- erable reduction on the commercial value of the site, this reduction enabling them to secure any further accommoda- tion they may require without any extra charge to them- selves.

The disinclination of the bank to retain Crosby Hall under their present scheme is, we understand, due to the fact that they have been advised that, having regard to the area which the hall occupies, sufficient use could not be made of it as it stands to justify the expenditure incurred. With the assistance, however, of the 60,000*l.* subscribed by the public the Council would be in a position to make an arrangement with the bank which would get over this diffi- culty.

If, however, the bank did not see their way to negotiate for the site on these lines, although they might be prepared to allow the Council to purchase it, there would still remain other business means of letting the site, and at the same time preserving the hall. We believe that the bank would assist the Council in its efforts to satisfy the public demand for the preservation of this historic building. For this purpose it is essential that two conditions should be observed—(1) That the bank agree to the acquisition of the property by the Council; and (2) that the Crosby Hall Preservation Committee undertake to transfer to the Council the sum which the public has subscribed towards the preservation of the hall. It would be useless for the Council to take any steps unless both these conditions were secured. With them in hand we believe that arrangements can be made suitable to the desires of the bank and of the Council; without them the present proposal falls to the ground.

It will be seen therefore that if such a scheme as is outlined above were carried through, at the end of sixty years the Council would have in its possession, on behalf of the public, the hall free of any encumbrance. During the intervening period it seems possible that the use of the hall by the public would be restricted, but in any case the building would have been saved.

We are informing the finance committee of our inten- tion to submit this report to the Council, and, in view of the very great urgency of the matter, we have asked them to consider the financial proposals of the scheme as it may be settled by us so that it may be considered by the Council on December 10. Our present recommendation is limited to power to negotiate, it being necessary for the Council to direct us to take these initial steps, so that if they are successful we may at a later stage present our completed scheme for consideration. These negotiations would not commit the Council to approval of any scheme, but would indicate the earnest desire of the Council to take into consideration the question of completing, on behalf of the public, an effort which we believe has only failed to succeed owing to the short time at the disposal of those who conducted the negotiations. We recommend:—"That in view of the imminent risk of Crosby Hall being destroyed unless immediate action is taken, the local government, records and museums committee be authorised to ascertain whether the Chartered Bank of India, Australia and China would sell to the Council the site they have purchased, which includes Crosby Hall, and whether the Crosby Hall Preser- vation Committee would be prepared to hand over to the Council the amount subscribed or promised by the public; and that the local government, records and museums committee do report whether on these lines suitable arrangements can be made to meet the requirements of the bank and at the same time avoid the destruction of the hall."

At the meeting of the London County Council on Tuesday, an amendment was carried to the effect that the committee should be empowered to confer with the City Corporation, the bank authorities, the Crosby Hall Preser- vation Committee, and the National Trust for the Preser- vation of Historical Buildings, with a view to ascertaining whether it was possible to make arrangements either to preserve the hall on its present site or to take it down and re-erect it or any part of it on another site to which the public could have access, but upon the understanding that there should be no charge upon the county rate.

The Parks Committee of the Edinburgh Town Council have accepted an offer of a statue of the late Dr. Guthrie, and recommend the Council to grant a site in West Princes Street Gardens, opposite Castle Street. The sculptor is Mr. F. W. Pomeroy, A.R.A.

## NOTES AND COMMENTS.

A MEETING of the Royal Institute of British Architects was held on Monday. It was resolved that, in view of the fact that early application will be made to the Privy Council for the general alteration of charter and by-laws, to postpone the question of closure until such time. The proposals for the revision, and by-laws by which a new class of Licentiate will be created, was adopted by a large majority. The Fellows and Associates proposed were elected.

It was an ingenious idea to employ the undercroft chapel of St. Mary's for the marriage of Lord Chancellor LOREBURN on Tuesday. At the beginning of the nineteenth century, according to JOHN CARTER, it was probably in a more desecrated condition than any other part of the Westminster Palace. It consisted of five bays separated by clusters of columns supporting the groynes. The first division was a public thoroughfare from Old Palace Yard to Westminster Hall; the second division was made the store-room for the rubbish of a low mechanic and in it the Westminster pillory and ducking-stool were placed; the third division was boarded off into compartments for the accommodation of the mechanic; while the fourth and fifth divisions served as a dining-room. "Could I," cried CARTER, "but convey one glimpse of the excellence of this little spot to the eyes of him who could preserve it, those hovering phalanges of architectural innovation would soon be driven into the distance of disappointment; their hopes of demolition would then be no more." It required, however, several years before the undercroft and St. Stephen's Chapel were made to appear as if they were respected by the Legislature. This week's event has demonstrated that the lower chapel, although it is only small, for it measures 90 feet by 28 feet, can be utilised for ceremonial purposes. The painstaking JOHN STOWE informs us that the chapel was dedicated to Our Lady of the Pew. It contained an image of the Blessed Virgin, which, he said, was richly decked with pearls, precious stones and rings, the value of which no jeweller was able to estimate. Great offerings were presented there, among others by RICHARD II. after the overthrow of WAT TYLER. On February 17, 1252, an altar boy in extinguishing the lights in some way set fire to the ornaments, and not only the image but a portion of the chapel was destroyed. It was afterwards restored by Earl RIVERS.

It suggested the influence of Classic art in Edinburgh when it was proposed to erect a copy of the Parthenon as a memorial of the Scottish troops who took part in the Napoleonic wars. The building seemed to be of an economical kind, and as stone abounded in Scotland the promoters of the project were sanguine of success. The expenses were found to be more than had been anticipated, and the structure has remained as a fragment. Various proposals for its completion have been expressed from time to time. But however liberal may be Scotsmen, money could never be found for the building on Calton Hill. In a lecture delivered by Professor GOURLAY before the Philosophical Society of Glasgow on Monday another suggestion was offered. The Professor said that the committee of the Edinburgh Corporation had recently reported that Lady STAIR's house was in many respects unsuitable for a museum, and that the completed structure on the Calton Hill might be used to house the treasures of the Scottish capital. Apparently the financial aspect of the case was not considered, and it is likely that the ruins will remain as they are until some enthusiastic millionaire will, regardless of cost, endow Edinburgh with a severely Greek temple.

A STUDENT of the South Kensington School in old days must be amazed when he sees the large number of professors, instructors, teachers, assistant teachers and demonstrators who now hold office and recalls the

few masters who formerly conducted all the class. Economy was then rigidly carried out, for it was proposed that students in other schools in the Metropolis and the provinces would grow jealous if they found that any special favour was shown to their rivals at South Kensington. Whether the later students of the school became more proficient than their predecessors is a question which it is difficult, if not impossible to answer. The new prospectus shows that there are classes for modelling, architecture, design, painting, etching, stained glass, tile painting and pottery, sculpture and marble cutting, relief ornament and design, tapestry weaving and embroidery, writing and illumination, metalwork and enamelling. The architectural course continues for five years, the sculptor's and designer's no less extensive, and in that time an industrious student should be able to turn his knowledge to account in practical work.

## ILLUSTRATIONS.

NATIONAL BANK OF SCOTLAND, NICHOLAS LANE, E.C.  
CATHEDRAL SERIES.—SOUTHWARK: NAVE, LOOKING WEST.  
DESIGN FOR NEW COUNTY HALL, LONDON.

THIS design was submitted in the recent preliminary competition for the new County Hall by Mr. W. ERNEST HAZELL, F.R.I.B.A., and Mr. WILLOUGHBY, architects. The Council chamber, its lobbies, committee-rooms and the rooms set aside for the use of the councillors, together with the offices of the heads of the various departments, occupy the ground floor. The main public entrance in the Westminster Bridge approach gives access to all parts of the building by way of the central and east and west corridors and six cross corridors. Another important entrance is on the lower ground-floor level in the centre of the Belvedere Road front. The Council chamber is reached from this entrance by a grand staircase and hall. Other entrances are provided to serve particular departments, and separate entrances, staircases and corridors are planned to allow the public to reach their respective galleries in the Council chamber. The public hall to seat 800 occupies a portion of the large internal area on the north of the site, and is reached from the Belvedere Road. Entrances, crush hall, cloak-rooms, &c., are arranged in such a way that they can be shut off from the rest of the building without interfering with internal means of communication. Facing the river is a terrace for the use of members of the Council, planned on the ground-floor level. Below the terrace is a spacious library for councillors' use. The ground and upper floors are devoted to general offices, private offices for the use of the twenty departments with their waiting-rooms, telephone-rooms, store-rooms, &c. Large dining and common rooms for the staff are provided on the fifth floor. Residences for the caretaker and hallkeeper and accommodation for servants occupy the sixth floor on the river front. The main entrance is in the Belvedere Road adjoining the external works department. Cloak-rooms for the staff and cycle stores are reached from the goods entrance.

The heating and ventilation of the Council chamber and public hall are arranged for on the Plenum system, having air-washing and warming apparatus and blowers in the inlet chambers on the roofs, and using shafts for vitiated air fitted with extracting fans. The remainder of the building is designed to be warmed by steam-heated radiators, the ventilation being effected by means of fresh air inlets both to the rooms and to the false ceilings of the corridors. The boiler-house in the basement is designed to accommodate four boilers each 30 feet long. The fronts are designed to be executed in Portland stone, with the roofs covered with green slates. Fire-resisting construction is arranged for throughout. The embankment is designed for execution in granite. The estimated cost is 848,814.

## PROFESSIONAL TRAINING OF THE SANITARY ENGINEER.\*

very essential that both practical and theoretical knowledge should run conjointly. Neither one can have ultimate value without the other. We suggest the course of professional training to fit a youth to the contracts on his own initiative:—

He should serve a period of, say, three years as an apprentice in the office of a recognised sanitist, during which he would learn the main principles of this work engaged upon the plotting and designing portion of it. He should attend a laboratory for at least three months of this period, and at least three technical classes throughout the sessions.

The last year at actual supervision. This year may be divided, so that for three months he should be engaged in plotting the actual work, for six months should act as an assistant inspector on some works, and the last three months should be devoted to measuring up and pricing and drawing accounts from the actual work. At this stage he should still something further wanted to crystallise and systematise the knowledge which has been gained. This should be achieved by

a course of one year at a recognised institute or school specially devoted to the higher branches of hygiene. The course should consist of at least 275 full working days of study of superintended studies and research.

At least one year as chief assistant to a sanitist of equal position. This brings us to a total of six years of training, and he should then be in a position to show that he is fully entitled to the degree of sanitist.

At the end of this time examinations should be held to test his knowledge at the end of the second course. This should be in the use of the term "student." At the end of the third course a final examination should be held for the diploma, and until the diploma for the final is obtained it is illegal to use the term sanitist. The examinations should be held and diplomas issued by the two institutes able to confer such degrees.

The subjects which these examinations should cover are largely varied. The following are but a few:—*Sanitary Engineering and Mechanics*.—These should be strictly within practical bounds.

*Sanitary Engineering*.—A knowledge of famous plagues and their cause and ultimate cure, and of the history of sanitary engineering and science.

*Sanitary Materials*.—Their geological or organic formation, their physical properties, their durable qualities; their common forms, shapes and sizes; their strengths, weights, and market prices.

*Sanitary Laws*.—Sewers and drains; Public Health, Building and Local Acts and by-laws; contracts, legal position of employers and contractors.

Also with the various sub-headings:—Meteorology, hydrostatics, planning and construction of buildings, drainage and sewerage and water supply, electricity, steam-power, heating and ventilation, lighting, kinetics, food and drink, biology, diseases and infection, refuse disposal, chemistry, sociology.

Though the foregoing list will have a formidable sound prospective sanitist, there is practically no subject of those named which should present difficulties to an intelligent student.

to resume. During the whole period of training it is utterly necessary to instil system into the student's mind, to be perfectly efficient one must have exact order in his knowledge as well as in one's papers. It is not enough for an architect, civil engineer, doctor, lawyer, or what not, to also undertake the duties of a sanitist.

By all means let each have as much knowledge as possible; but let them not lightly undertake such vast responsibilities unless they are prepared to make a life's study of this profession. Why do these people take up sanitary engineering? For the simple reason that there is no present no defined and separate profession dealing with this work to whom they can apply for expert advice. This Institute be the pioneers of this great step and endeavour by arranging the examinations so that they aim at a definite purpose and end of launching forth a limited number of trained and recognised sanitists to form the nucleus of an honourable profession? Many jobbing sanitists and men in similar positions would be sorry to see the end attained, as at present their smattering in

sanitary work is financially an excellent thing. We must, therefore, not forget that whilst the sanitist's work would be noble in its object, there would also be an excellent field for energy and talent for the sanitist in our otherwise somewhat crowded professional ranks.

During the whole of the training it is most necessary to understand the position between the client, professional adviser and the contractor. Much litigation and trouble would be saved if the professional advisers more fully comprehended their moral and legal obligations. The aim should be to give the full and complete benefit to the client of the whole of one's knowledge, in order to attain the result required without unnecessary expenditure.

A work cannot be called completely successful if the object is obtained at a cost greater than is absolutely essential. The code for all work should be honesty to all parties, and must not favour the contractor at the expense of the client, or *vice versa*. The sanitist should maintain a position and act in all things so that every step and action can be justified before the highest tribunal.

Never have work of an experimental nature executed with other people's money without first informing them that it is experimental and obtaining their written sanction.

If you are called upon to do work with which you do not feel competent to deal it is not necessary to refuse that work; but it should never be considered *infra dig.* to call in and consult a specialist who is competent to act for or with you.

The question of system has already been mentioned under training. System is one of the most necessary things to the man in practice. To be successful in his work his office and staff must be perfectly organised. Should he require information, correspondence or plans dated twenty years back, he should be able to get it at a moment's notice. It is also very necessary to have perfect sympathy and harmony between the principal and his staff.

If an assistant does not fulfil all requirements, it is not sufficient to retain him and have constantly to find fault. If he is not equal to his work he should be employed otherwise at a lesser salary, or dismissed. Friction in any office is demoralising.

It is necessary, in dealing with forms of contract, to thoroughly appreciate what a contract is, and what documents generally form the contract, as for instance:—The agreement to do certain work for a certain consideration. The schedule of conditions of contract which are generally attached to the agreement. The specifications describing the work and materials, and the drawings. He should, except in special cases, advise against the quantities being made part of the contract.

In drawing up the contract documents it should be always remembered that it is only those which are signed by the parties (or referred to in a signed document) which, from a legal point of view, can be considered as showing the work to be undertaken; no verbal or written documents exchanged before the date of contract will have any bearing upon same. It is therefore very necessary for a professional adviser to be able to, and actually to, draw up proper and full specifications, plans and conditions.

Lawyers should never handle the specifications and plans, but in the case of conditions perhaps it is better that they should peruse them and make suggestions, although this entirely depends upon the professional adviser's experience of and connection with conditions and contracts. If he is not well acquainted with all important legal decisions on contracts, he should certainly trust to the lawyer rather than himself. Carefully-worded conditions have many times saved much unpleasantness on points which, if not provided for, would be serious for all parties. In the preparation of the contract documents, plans and specifications, it is very desirable to see that every possible information is clearly given, and, wherever possible, figured dimensions. One is often called upon to give technical evidence in the courts; this is one of the most trying and difficult positions to be placed in. There are very many points to be considered. It must not be forgotten that the judge, counsel and jury (if any), and your client are all ignorant of the work in question from a technical point of view. You are, therefore, called upon because you are an expert to enlighten them, but it will be found most difficult in giving evidence to explain your meaning clearly and truthfully. Counsel have a knack of trying to so twist one's statements to mean something quite contrary to one's intentions. But firmly adhere to your point and insist on making your meaning clear. The first point to be careful of is to prepare a report, so that you can, if called upon, substantiate

\*From the paper by Messrs. A. A. Scott and P. M. Triggs read at the meeting of the Institute of Sanitary Engineers.

and give reasons for every statement. These statements should be either known facts or express your professional opinion, formed after taking into consideration all the pros and cons. The second point is to have your statement of evidence taken down and carefully read over and checked by your solicitor before same is handed to counsel.

In all cases of dispute it is much to the benefit of all parties concerned to settle amicably. Should you be fortunate enough to win your case, you will generally lose financially far more than by any amicable arrangement. The question of fees for professional work we do not propose to discuss this evening, but, none the less, consideration should be given to fixing a standard scale of charges and forms of agreement with clients.

Let us say, in conclusion, that these notes have not been prepared with any hope of covering the whole ground, nor any intention to deal with any part in detail. They are presented to you with a view of opening up certain points for full discussion, and in the hope that they may form an incentive for detailed papers on different sections at some future date.

### EARLY ART IN SCOTLAND.

AT the opening meeting of the Glasgow Archæological Society, Professor Sir William M. Ramsay, Aberdeen, gave an account of recent research and investigations he had made among the ruins of an ancient, almost forgotten Byzantine city in the south-west region of the great Central Asian plain, and discussed some of the problems suggested by the city's former greatness and the present-day desolate and decaying condition of the region and its people. In leading up to his subject, he made an interesting reference to the prehistoric art of Scotland, which seemed to him never to have received justice. There was, he said, in the country, at least in the north-east regions of it, how far more he could not say, an early art of a singularly high and singularly interesting character—one of the arts of the world, one of the special kinds of art which stood out distinguished from all others. He confessed he found that it was extremely difficult to bring that art into relation with any other of the known early arts of the world. It seemed, so far as one could judge, to have arisen spontaneously in the country. It was distinctly Oriental in its analogies, and was marked off clearly from Western art—from the art of Greece, or Rome, or Europe generally. There was an Oriental feeling about it, and it opened up to them a vista of history that had still to be traced.

### ROMANS IN THE MANCHESTER DISTRICT.

A LECTURE was given on Monday by Professor F. J. Haverfield on "The Roman Occupation of North-western England." He said he confined himself in the main to that piece of Roman Britain which covered what he might call the Manchester plain and its adjacent hills. This was in modern terms South Lancashire and Cheshire with their borders. It was a small area, hardly fifty miles square, and a good part of it was sea or estuary. It was also, as he desired to say frankly, an area which possessed no special or individual importance as a portion of the Roman Empire or Roman Britain, but was just a chance fragment. If, however, it was not important, it was typical of the military organisation of the Romans and of the conditions and ideas of the ancient world, which contrasted strongly, and almost violently, with the spectacle which it offered to-day. The plain possessed importance as a convenient base for operations, offensive or defensive, against the hill tribes of North Wales. By the aid of a plan of Roman Chester as nearly as it could be traced, he explained the difference between the quarters of a legion, such as it represented, and a fort like that of Mancunium or Melandra or Castleshaw. The fortress for a legion was of an area of about 50 acres, that of an auxiliary regiment of an area of 5 to 10 acres. There were no other forms of fort but these two, except small block-houses, used occasionally. As to the fort at Manchester, he said that a great deal of information was wanting, in spite of the efforts of Mr. Roeder and Mr. Bruton. There was perhaps not very much more to find, and yet not very much could be said to be known of it. The very greatness of the modern city had stamped out the vestiges of its birth and childhood. Melandra was still only partly excavated; Ribchester might yield a little more; Wigan, he thought, might yield results to a careful investigator, and at Chester the parts of the Roman wall remaining still held probably

Roman sculpture and inscribed tombstones. In conclusion, Dr. Haverfield commended the work of the new societies in its attention to archæology. Liverpool had examined the Roman remains of Wales; Sheffield and Manchester had formed a Yorkshire committee for a similar purpose; Manchester had its own appropriate portion in the neighbourhood, as Professor Ramsay had already fully recognised. He would urge that Ribchester might make up for having obliterated Roman remains by exploring the sites that lay so close around it.

### IMPERIAL VISITS.

LAST week the German Emperor visited the churches of Christchurch Priory and Romsey. The *Hampshire Advertiser* gives the following account of what occurred:—

At Christchurch the Vicar was absent, and the service once commenced with an explanation of the beautiful nave, which is of Norman architecture; whilst the lower arches is a fine example of what is known as Saxon work, an enrichment of the Saxon period. The Emperor was keenly interested in this, and said he had never seen architectural work of this kind before in any church. He remarked also that he was more interested in the Saxon than in any other style of church architecture. He passed a high encomium on the beautiful work of the screen dividing the nave from the choir.

Passing through to the choir the Emperor spent some time in examining the splendid miserere oak carved monks' stalls, which, notwithstanding the age, are in still a perfect state. When the Emperor saw the carved head of Richard III. and the one showing his Satanic Majesty on the woolsock, the Emperor was highly amused, and when it was explained that the latter was intended as a caricature of the Chancellor, at that time, he turned to his Chancellor and laughingly remarked, "Of course, that is not intended for you." On the east side of the choir the Kaiser's attention was directed to a carving on one of the stalls of the Fox preaching to Geese, at which he laughed heartily.

Just as they were passing through the end of the choir the Vicar (to whom a message had been sent) arrived, after being introduced to the Emperor by Colonel Wortley, proceeded with His Majesty round other interesting portions of the historic fabric.

The Kaiser expressed great admiration at the work of the splendid reredos of the fourteenth century, which still retains much of its original work. He stayed a little time examining the beautiful tracery and masonry of the famous chantry of the Countess of Salisbury, which was beheaded in the time of Henry VIII., the chantry having been built by the countess for the interment of herself and her son, Cardinal Pole. "The carving of the tracery," remarked the Emperor, "is simply lovely."

One of the next objects of interest visited was the tomb of Sir John and Lady Chydieke, on which are placed recumbent figures of Sir John and his wife, the former in the mail and armour of the time (1455). The Emperor remained a long time examining this ancient piece of sculpture, and went most minutely into every little detail, and remarked on the curious manner in which the tomb of that far-off day was buckled on. The way in which the tomb was fastened together was, he said, most interesting.

The beautiful lady chapel, some 70 feet in length, was next explored, and the Emperor was much interested in the two tattered flags suspended from the ceiling, which were in existence before the time of the union of Ireland. The remains of the splendid reredos, which suffered so much destruction during "Reformation" times, was also greatly admired by His Majesty.

Before leaving the Kaiser, who expressed himself delighted with his visit, signed the visitors' book, the Emperor's inscription reading:—

WILLIAM,  
26 XI., 1907.

The visit lasted the best part of an hour.

At Romsey Abbey, the Rev. M. E. West, one of the curates, acted as guide. Mr. T. Iremonger, the sexton, did his part in pointing out certain interesting features. From the critical and careful inspection of some parts of the building by the Kaiser, one would take him to be an archaeologist of no mean order.

His Majesty was especially struck with the Norman architecture, and did not hesitate to say he liked it.

he had seen at Christchurch. He inspected the on some of the pillars, and compared them with he cathedral carvings in Germany. Another point ested his attention was the apses at the east end rth and south aisles, these being round inside and tside. Passing through the nuns' door, His Majesty dmired outside the building several courses of which, although grievously mutilated, still show ine piece of work it was. The great row of also came under his purview, and he wished to meaning and history of some of them. Even the which the abbey is built did not escape his notice, ked for information as to where it came from, and himself as more pleased in its natural state and ed, as in some other buildings. As he left the the N.W. door it was pointed out to him that it was to replace a porch over this entrance, and he was o say that he wished them every success in restor- obey. The visit and inspection evidently gave the very great pleasure. The autographs left in the ook were:—"William, F.M., 27-11-07"; "M. G. urg," "Count P. Wolf Metternich," (one unde- e), "Edward Stuart Wortley," and "Dr. Ilberg."

### THE FRANCO-BRITISH EXHIBITION.\*

ERN exhibitions may be regarded as the stock- ing of the resources of civilisation; they present cal summing-up of the achievements of a progres- and mark, as it were, the milestones by which we e of the advance made in Science, Art and Indus- m the universal adoption of exhibitions as a means unctuating our progress, they may be regarded as ial feature of the age in which we live. It was in at the exhibition idea originated. An exhibition in that country in 1798, and the tenth National n took place in Paris in 1849. The success attended this, and the intervening displays, d a desire for a similar exhibition in London. ety of Arts had long advocated industrial exhibi- England, and had actually held them in the Adelphi d following years. In 1849 His Royal Highness ice Consort—who was then President of the -took the matter in hand, with the well-known at the world's first international exhibition was held on in 1851. It was within these walls, therefore, idea of the international exhibition was conceived, Society of Arts may accordingly be termed the f international exhibitions.

In 1851 the world has witnessed many exhibitions ternational character which rival one another in alace to palace and land to land until the mind bewildered and reels at the magnitude of the vast presented to it, and from the very immensity of me fails to derive those advantages which a more display would afford. In the case of the Franco- Exhibition this perplexing profusion will be ; it will not overtax the powers of assimilation of ary visitor. It seems probable that in many of itions of the future the international element will rather than plural in its application, and what could e fitting than that the two great nations, joint of the exhibition era, should set an example in this and should join hands in happy union for the pur- setting before the world their combined resources? ce and Great Britain possess distinguishing charac- which admirably blend together. Each abounds qualities which form the complement of the other. olidity, adorned with French grace, yields a result other combination of nations can approach. In the of the world, the greatest achievements in the art of on have been the product of two races, just as the wers are obtained by hybridisation. It was through gling of the Pelasgian and Aryan races that Greece d those masterpieces of plastic art which form at e delight and despair of the modern world. It was ombination that the Classic orders of architecture, ound their consummation in Athens at the time of owed their birth. The other great school of architec- : Gothic, which attained perfection in England during is of the Edwards in the fourteenth century, derived me inspiration from the genius and fire of the Celt ng upon the matter-of-fact and business-like habits

of the Anglo-Saxon. It may be confidently anticipated that the world will be blessed with a propitious fruition when the ample achievements of the Anglo-Saxon and Latin races intertwine and reinforce each other.

In the Franco-British Exhibition not only France and the United Kingdom will be engaged, but the colonial possessions of these two great Powers will play an important part. Here again we have a significant conjunction. France, in addition to being a great colonising empire at the present day, can boast of a record in colonisation second to that of no other nation. The success of the French colonies in Africa, Indo-China and elsewhere recalls the former achievements of France in Canada and India. In no country do the theory and practice of colonisation receive more careful and systematic attention than in France. Two colonial conferences were held in Paris during the exhibition of 1900, and it is from French authors that some of the most interesting and instructive descriptions even of the British colonies emanate. The French colonies, dependencies and spheres of influence, second in number only to those of Great Britain, have an area of over 4,000,000 square miles and a population of about 60,000,000.

A wide difference exists between the methods of colonisation of the two great Powers—Great Britain tending toward empirical and France toward systematic and scientific measures, so that an interesting comparison may be drawn between them. Success in colonisation is sometimes determined by a faculty of assimilation to the customs of the countries colonised, and sometimes by the power of enforcing novel usages on the aboriginal inhabitants. Nations vary in their capacity in these two directions, but it may be confidently affirmed of France that she has a genius for both; for example, it is related that De Fontenac, for the purpose of recommending his administration to the American Indians in the West, went so far as to take part in their mysterious rites; while, on the other hand, Dupleix in the East Indies succeeded in superimposing on the population the system of European military discipline.

It is instructive in passing to compare the Colonial Empire of Great Britain, as existing at the time of the International Exhibition, 1851, with His Majesty's possessions of the present time. India was then under the government of a chartered company. Canada consisted merely of Ontario and Quebec, Nova Scotia and New Brunswick sending independent exhibits. Tasmania was officially described as Van Diemen's Land. It is interesting also to note that the illustrious colonial statesman and empire builder, Lord Elgin, father of the present Secretary of State for the Colonies, was at that time Governor-General of Canada.

But it is not only on the grounds above stated that the apposition of France and Great Britain in the friendly arena of an exhibition is to be welcomed. The history of the two races has for nearly a thousand years been closely intertwined. It is in Normandy that we find the home of our Plantagenet kings. The tomb of Richard the Lion-hearted is to be seen in the abbey of Fontevrault. Our language is saturated with words of French origin, and the monarch of the British empire still gives or withholds his royal assent to the Acts of the British Legislature in the French tongue. Repeated interchanges of visits between Edward the Peacemaker and the President of the French Republic have taken place. What more natural, therefore, than that the King should write from Paris to "wish the exhibition every success, and sincerely hope that it may be the means of strengthening the friendship which so happily exists between the two countries," or that M. Fallières should state in a message to the Lord Mayor of London that the French Government would not fail to give its cordial support to the exhibition.

As most of you are aware, a site of 140 acres has been secured for the exhibition at Shepherd's Bush. The principal entrance will be immediately adjoining the station of the Central London Railway (popularly known as "The Tube"), and within four miles of Charing Cross. It is also close to the Uxbridge Road station of the West London and North-Western and Great Western railways, and Metropolitan, Hammersmith and City Railway stations. It is in close proximity to the Shepherd's Bush station of the London and South-Western Railway, and in direct connection with the District, North London, Metropolitan, London, Brighton and South Coast, South Eastern and Chatham, and Great Central railways. It is, moreover, at the centre of a network of tramways and omnibuses affording means of communication with all parts of London and the suburbs.

\* From a paper by the Hon. Sir John A. Cockburn, K.C.M.G., for the Society of Arts.

The various methods of transport are capable of conveying to the spot 75,000 persons per hour, or nearly a million visitors during the hours per diem in which an exhibition is usually kept open.

On the ground adjoining the exhibition the quadrennial Olympic games are to be held. This also is an auspicious conjunction, for it was at the instance of France that this great festival of ancient Greece was revived in Athens in 1896. The Olympiad was celebrated in Paris in 1900 and in St. Louis in 1904; generations will pass away before it is again held in England, and as at least twenty-two nations are taking part in the contests, the occasion will be unique in the annals of British sports. To accommodate the vast concourse of spectators, there is in course of erection a colossal stadium, oval in form and capable of comfortably seating 68,000, and on occasion of holding 150,000 people. Some idea of the vast proportions of this theatre may be gathered from the fact that it encloses a cycle track with  $2\frac{1}{4}$  laps to the mile and a running track of  $\frac{1}{2}$  mile in circumference. There is in the arena of the stadium a tank 240 feet in length and 14 feet in depth for the swimming and high diving competitions.

Those who have visited this site cannot fail to be struck with the fair palaces, which, as under the wand of some magician, have risen like an exhalation from the soil. At the commencement of this year, when the first sod was turned by the Count de Manneville on behalf of the French ambassador, the surface of the land presented the bare appearance of an ordinary farm. When the first stanchion of the Olympic stadium was placed in position in August, huge skeleton buildings were beginning to appear upon the ground. These are now rapidly being converted into resplendent palaces as if the architect were the possessor of an Aladdin's lamp. The whole of the framework of the buildings is of steel, filled in with concrete slabs, thus forming a structure at once light, strong and fireproof, and capable of marvellous rapidity in erection.

Among the many beneficial influences exercised by exhibitions may be included the complete transformation of the anatomical structure of important buildings. Up to a few years ago all considerable edifices depended entirely for their support and stability on stone or brick, and it is chiefly due to the example set by exhibitions that steel, the characteristic of the present age, has become the main source of strength in buildings as in all other structures. Primitive man dwelt in caves, either natural or artificial. In the dim dawn of humanity some troglodyte was inspired with the happy idea of erecting a cave on the surface instead of digging it underground. At first cyclopean stones and huge slabs of rock were used in the construction of these newly-invented dwellings, and although in course of time lighter and more shapely blocks were substituted, still stone and earth continued to furnish the main supply of architectural material. All this is now changed; buildings depend for their stability, both as regards tie and thrusts on steel, and although stone is still largely used in architecture, it is introduced chiefly for purposes of ornament, and merely forms as it were a panelling to fill up the spaces between huge pillars and girders of steel.

As might be expected from greater experience in exhibitions, as well as from the national inclination to system, the organisation of the French for the purpose of exhibitions is much more complete and effective than anything which exists on this side of the Channel. When the United Kingdom takes part in an exhibition, machinery is hastily improvised which performs its work as efficiently as such an extemporised contrivance will permit, and falls to pieces so soon as the occasion is over. In France a permanent body recognised by the Government under the name of the Comité Français des Expositions à l'Etranger, undertakes on behalf of the exhibitors all that which in this country is performed by isolated effort, so that the experience derived from successive exhibitions is accumulative, and is for the future made available for each individual exhibitor.

Notwithstanding the importance attached to exhibitions by other nations as the best, and in the long run the cheapest mode of advertising, a good deal of apathy in regard to them has always existed in this country. The departmental committee of the Board of Trade which recently reported on the participation of Great Britain in international exhibitions states that there can be no doubt, from the personal point of view, they are not universally regarded with favour by manufacturers in this country. This reluctance to exhibit is traced to a variety of causes. It is asserted that exhibitions have, owing to increasing

frequency, lost much of their novelty, and from the size attained by universal exhibitions, individuals are apt to pass unnoticed by the majority of visitors. In addition to the trouble and expense many manufacturers are of opinion that they are liable to suffer serious disadvantage on account of goods being copied at exhibitions by foreign rivals. A similar objection was made to the project of the Exhibition of 1851, and, seeing that Great Britain at that time possessed almost a monopoly of industrial processes, it has been some ground for the charge. These conditions, however, no longer exist. Other nations have now attained a position equal and in some respects superior to our own. If "in some instances exhibitors have experienced advantages through having their goods copied, they do not fail to benefit by themselves inspecting the goods of their competitors." So far as the finished product is concerned, an equal danger of imitation is incurred by the fulfilment of a single order. Be this as it may, it is borne in mind that the French are bent on making their play at this exhibition superior to anything that has been seen out of Paris. Great Britain is their best customer, and they will lose no opportunity of placing their products in an attractive form before the buyer. It is to be noted that the most important exhibits will be made by both the French and the British colonies, the latter expending approximately the same in their display, and from their distant parts many visitors will flock to the exhibition. In addition to the Olympic games will attract a vast concourse of spectators from every quarter of the globe. From the information derived from the applications already received, every assurance is given that the British exhibits will be of the highest quality on the occasion, and indeed it would have been a national calamity if these visitors were confronted with a meagre representation of the industrial capacity of the United Kingdom. As compared with that of our neighbours, the departmental committee places the matter in a nutshell when it remarks that "to a large extent the question we have to decide is not whether it pays to exhibit, but whether under modern conditions we can afford to exhibit. And is of opinion that the evidence which is afforded affords convincing proof that the answer to this question is in the negative."

The proposal of the exhibition emanated from the French Chamber of Commerce in London and received the warm support of the French Minister of Commerce. A large representative meeting was held at the Mansions on July 11, 1906, with the Lord Mayor in the chair, and a resolution in favour of the exhibition and approving the action already taken was unanimously passed. It was resolved that all profits resulting from the exhibition should be devoted to some public purpose, to be jointly determined by the representatives of the two countries concerned.

The exhibits will be classified and arranged in the following groups:—Education; science; fine arts; paintings, cartoons, drawings, etchings, engravings, sculpture; architecture; liberal arts; engineering and shipping; branches of engineering will be illustrated; transport; agriculture and viticulture; horticulture, arboriculture, forestry and fisheries—appliances and processes of horticulture and arboriculture; alimentation; decoration—furnishing—decoration and fixed furniture, plumbing, sanitary appliances, wall-papers and paper-hangings; household, art and office furniture, carpets, tapestries and hangings for upholstery, upholstery and upholsterer's decorations; ceramics (pottery and porcelain), glass, crystal and cut glass, apparatuses and processes for heating and lighting, apparatus and methods (not electrical) for lighting; textiles; chemical industries; various industries of science, economy, sanitation, public relief; women's work; and colonisation; sports and physical culture.

In order that the British section shall on this occasion have the advantage of the experience not only of the French but of other nations who have made elaborate and successful displays at former great international exhibitions, the executive committee have decided that they will re-arrange the undermentioned arrangements in their own hands, and at a small charge to assist in providing for the expenses of such services.

Steps will be taken to provide that the whole of the various sections shall be decorated in a harmonious, artistic and tasteful way so that the courts or decorated divisions of each group shall practically form a scheme complete in itself.

In order that every possible facility shall be given to exhibitors, the committee will take charge of the re-

goods at the respective exhibition buildings for which exhibits are destined, so that workmen employed by exhibition authorities will place them in their packing (if any), on the space allotted to the respective exhibitors, who will forthwith unpack them. The cases can be removed by the workmen of the authorities ordered and finally brought back for repacking the goods exhibited at the close of the exhibition.

It has been found that a great deal of business has been lost in other exhibitions on account of insufficient information being available of the various exhibits through lack of proper knowledge on the part of the exhibition authorities, the committee have decided to employ a sufficient staff of well-informed men, who will be capable of giving full information concerning any of the exhibits in any particular group or class.

One of the most important features on which the commercial success of any exhibition greatly depends is the establishment of a commercial bureau, from which the intending exhibitor will be able to receive the fullest possible information concerning all goods displayed in the exhibition, and in particular as to the place where each exhibit can be seen, together with the literature concerning it. This has never before been attempted in any exhibitions held in this Kingdom, though it was successfully done at the Paris Exhibition 1900, and the St. Louis and Chicago Exhibitions. The commercial bureau will practically be of great advantage to all exhibitors, as well as of the public, and will greatly facilitate business transactions.

As a view to contributing towards the above expenses the committee have decided to make a nominal charge of 2s. 6d. per superficial foot of the space occupied by each exhibitor, and to arrange a graduated scale of charges so that the exhibitors, who, by the nature of their exhibits, are obliged to take up a large space, *e.g.* furniture, machinery, carriages, &c., sanitary installations, &c., will be at the advantage of a lower price than those who only occupy a small space.

The tariff for space, and the contribution towards the handling of goods, information attendants, general lighting of halls, police, and fees of commercial agents will be as follows:—

Exhibit space in the interior of buildings.	Price per superficial foot square including one frontage.	Decoration of section; handling of goods, of cases up to 250 lbs. each; information attendants; general lighting of halls; police; and commercial bureau fees.
	s. d.	s. d.
50 sq. ft.	10 0	2 6
100 "	9 0	2 6
150 "	8 0	2 6
200 "	7 0	2 0
300 "	6 0	2 0
500 "	5 6	2 0
750 "	5 0	1 6
1000 "	4 6	1 6
500 " or over	4 0	1 6

Minimum charge for individual exhibits . . .	£20
Minimum charge for collective or groups of exhibits . . . . .	£5 each exhibitor.
Charge for more than one frontage will be as follows:—	
	Per foot additional frontage.
Central avenues . . . . .	10s.
Main avenues . . . . .	8s.
Side avenues . . . . .	6s.
Other frontages . . . . .	5s.

It might be expected from the dual nature of the exhibition, one-half of the space will be devoted to French, the other half to British exhibits. For example, the Palace of French Industries is on one side of the Court of Honour, and the British Industries on the other. The British Colonies occupy the left of the plan, while the French Colonies are on the right. But in this bilateral arrangement there will be no attempt to secure a rigid symmetry. The corresponding buildings will not be counterparts the one of the other; while bearing mutually a harmonious relation, they will have its distinguishing features of outline and decoration. There will be that diversity in agreement which is the soul of harmony. It will not be as in the famous exhibition of a mechanically balanced garden, where

Grove nods at grove, each alley has a brother,  
And half the platform just reflects the other.

There are palaces of applied art, of women's work, of decorative work, of music and of fine art; in the latter the French and British exhibits will occupy opposite sides of the same building. There is an Education Hall and a Hall of Electricity. The Machinery Halls contain about 300,000 square feet of space and form three sides of a huge quadrangle, within which, together with other municipal edifices, will be situated the pavilion of the Ville de Paris, on which the Municipality of Paris is expending a sum of £12,000. The foundation-stone of this structure was laid by Monsieur Le Fevre, the president, in the presence of the French ambassador and a delegation of the Municipal Council.

Embosomed in delightful gardens there is a graceful structure which will be used as a royal pavilion. There will also be a Garden Club and a Sports Club. Standing on an island with three causeways, in a central lake, rises, with slender aspiring lines, the Imperial Tower.

The palaces of the exhibition, some twenty in number, are surrounded by gardens laid out by the best French and English landscape gardeners. The space in the centre of the exhibition area, lying between the Imperial Tower, the Franco-British Pavilion, the Palace Restaurant and the Garden Club, will be known as the Elite Gardens; adjoining this is the Court of Arts, encircled by lagoons, on which boats and launches will ply with passengers, the total navigable distance, including the lake in the Court of Honour, being nearly five-eighths of a mile.

In a galaxy of enchanting scenes, the Court of Honour will glitter like the queen jewel in a cluster of gems. Here is a spacious lake, spanned by a bridge strong enough to bear the tramp of an army, but with tracery, airy and gossamer as a strand of coral. At the head of the lake a cascade leaps in musical cadence down a terraced fall. On the bridge and at intervals jutting into the water from the sides of the lake are stationed dainty pavilions, in which visitors can sit and enjoy to the full the surrounding delights. The scene will be surpassingly brilliant by day, but at night, when a thousand dazzling lights make dim the stars, and are multiplied myriad-fold in the broken reflection of the waters, whose surface is stirred by a procession of gaily-decorated craft; when by an ingenious arrangement of electric beams the hues of the rainbow are refracted through the cataract in a scheme of bright and ever-changing colours, the sight will be one to bewitch the beholder, and the *chef-d'œuvre* of Mr. Imre Kiralfy, one of the greatest living masters of form and colour, will long dwell in the memory as a beautiful dream.

A special committee has been appointed to provide for the comfort of visitors from the country and abroad. Not only the classes, but the masses of the French people will be attracted to the exhibition, and it is safe to predict that numerous and lasting ties of personal friendship will be the result. There is no room for doubt that the exhibition will advance industry, extend trade and still more strongly cement the bonds of amity which now so happily exist between the neighbour nations. But there is yet a deeper significance and a wider scope in a movement so well calculated to bring the respective peoples of two great Powers into intimate acquaintance. No nation can live for itself alone. The first International Exhibition in 1851 was called the Congress of Peace. May we not look upon the Franco-British Exhibition as one of the most potent influences in placing on an assured basis the peace of the world?

### SCOTTISH SOCIETY OF ANTIQUARIES.

THE annual general meeting of the Society of Antiquaries of Scotland was held in the National Museum of Antiquities, Queen Street, Edinburgh, on Saturday, Dr. David Christison, vice-president, in the chair.

In the annual report by the secretaries it was stated that the number of members added during the past year had been 41, and the number of removals from the roll by death and otherwise 36, making a gain of 5, so that the Society begins the present year with a total membership of 704, and the ballot at that meeting had added 17, making the number now on the roll 721. The excavation of the Roman military station at Newstead, Melrose, begun in February, 1905, under the supervision of Mr. James Curle, has been continued throughout the year, and has been extraordinarily successful both in regard to the elucidation of the structural remains and the recovery of such a large quantity of interesting and valuable relics, some of which are of types not previously found in Britain. For the

complete investigation of the story of the station in its different periods of occupation, more funds than the Society has at present at its disposal will be required; but, so far as its main features and their details have been disclosed, the results will be made public by means of the Rhind Lectures, to be delivered by Mr. Curle probably in March next.

From the report to the Board of Trustees with reference to the National Museum of Antiquities under the charge of the Society, it appeared that owing to the very large increase in recent years of the section illustrative of the Roman occupation of Scotland, due to the donations of the collections obtained from the excavations undertaken by the Society at the Roman stations of Birrens, Ardoch, Lyne, Camelon, Inchtuthil, Castlecary and Rough Castle, the whole of the exhibition space in the existing cases had been fully occupied, and two new cases were being provided by the Board of Works for the reception of the Newstead collection. The number of objects of antiquity (exclusive of the Newstead collection) added to the museum during the year has been 300 by donation and sixty-eight by purchase, and the number of volumes added to the library has been 142 by donation and thirty-seven by purchase. Among the donations to the museum which receive special mention are the collection from the Broch of Jarlshof, Sumburg, Shetland, presented by Mr. John Bruce of Sumburg; a collection of over 100 specimens from Coll and Tiree, described in his book on Coll and Tiree and presented by Mr. Erskine Beveridge; and a collection of rare brooches and other ornaments from a Viking burial in Oronsay, presented by the Right Hon. Lord Strathcona, K.C.M.G.

The office-bearers for the ensuing year were elected as follows:—President, the Right Hon. Sir Herbert Maxwell, Bart.; vice-presidents, David Christison, M.D., LL.D.; the Right Rev. John Dowden, D.D., LL.D.; and Sir Arthur Mitchell, K.C.B., M.D., LL.D.; Councillors—Sir John Stirling Maxwell, Bart., and John R. Findlay, representing the Board of Trustees; Sir Kenneth Mackenzie, Bart., representing the Treasury; Messrs. Thomas Ross, J. D. G. Dalrymple, J. Graham Callander, Charles Edward White-law, Ludovic M'Lellan Mann, William Garson, W.S.; the Hon. Lord Guthrie, the Hon. Hew H. Dalrymple, and Sir James Balfour Paul; secretaries, W. K. Dickson, Advocates' Library, and Alexander O. Curle, W.S.; foreign secretaries, the Rev. Professor A. H. Sayce, D.D., LL.D., and J. Maitland Thomson, LL.D.; treasurer, John Notman; curators of the museum, the Rev. John Duns, D.D., and Alexander J. S. Brook; curator of the coins, George Macdonald, LL.D.; librarian, James Curle.

#### EDINBURGH LIFE ASSURANCE COMPANY.

THE Edinburgh Life Assurance Company, which was founded in 1823, has a peculiar interest, for Sir Walter Scott was not only one of the earliest policyholders, but was also one of the directors extraordinary. The offices of the company were among those erected after George Street was opened. Owing to the increase in the business it has become necessary to erect new offices, and an eligible site was secured adjoining the old offices.

The new offices have façades to George Street and Hanover Street of 66 feet 9 inches and 91 feet 6 inches respectively. The design is Renaissance, with some leaning to French work of the eighteenth century in its details, and the building had to be planned to suit the rounding off of the corner of the site at the junction of the two streets. The architect being strongly of opinion that the rounding at the angle would be detrimental to the appearance of the building unless vigorously treated, it was decided to introduce a dome of such diameter as to make it a marked feature of the elevations. The building has accordingly been designed with a dome rising to a height of 100 feet from the pavement, its diameter at street level being 34 feet. The base of the building is of grey unpolished granite, rising 5 feet 6 inches from the pavement level at the top of Hanover Street. Above the granite the ground floor is treated with plain rustication so as to give strength for the support of the columns which rest on it and are carried up through the two storeys above. The company's main office, which measures 54 feet by 45 feet, is dependent in great measure on the light from Hanover Street, and the height of the ground floor storey had to be made very considerable in order that windows of adequate size could be introduced. Above the columns there is

a large entablature and cornice and a balustrade. It is an attic floor, which it is intended shall be equipped with studios, and which is accordingly lit by roof lights. The company will occupy the whole of the ground floor, basement, and more than half of the first floor, the remaining part of the first floor and the floor above being available for letting. The entrance to the company's offices is in the centre of the George Street front, and the letting offices, with elevator attached, is in Hanover Street. The doorway to the company's office is surmounted by a pediment containing a representation of the company's seal. Owing to the difficulty of getting good stone of satisfactory colour, it was decided to use Portland stone, which is used in the best London work, and gets to a large extent in important buildings throughout England and Ireland. The stone is shipped direct from the quarry at Leith, and is worked here. The building is constructed throughout with steel stanchions and floors of reinforced concrete, and for the purposes for which it is used is regarded as indestructible by fire. The drum of the dome is to be made of lead, and the dome itself will be covered with copper. The architect of the building is Mr. Dick-Peddie, 8 Albyn Place, Edinburgh.

#### QUESTIONS IN CONSTRUCTION.

THE following were among the questions to be attempted by students at this year's examination of the College of Science, London, and which, with other questions, will be found in the new prospectus:—

A beam 20 feet long overhangs its supports 4 feet at each end and 6 feet at the other. A uniform load of 2 tons per foot run rests on the part between the supports, and of  $\frac{1}{2}$  ton at each end. Draw the bending moment diagram and measure the maximum bending moment.

A king-post truss supporting a roof has a span of 12 feet and a rise of 8 feet. The loading is 1,200 lbs. on each of the upper joints. Determine the forces in the members and distinguish ties from struts.

A tank 3 feet long, 2 feet 6 inches wide and 6 inches deep, weighing 80 lbs. when empty, is supported with water, and is supported on two cantilevers 30 inches long, half the load being spread uniformly over each. Find the maximum bending moment on one of the cantilevers.

If the cross section of the cantilevers is of the form of a rectangle 2 inches wide,  $2\frac{1}{4}$  inches deep, metal  $\frac{3}{8}$  inch thick, find the greatest direct stress in the flanges.

Discuss the general graphical relations between loads, shearing, bending moment, slope and deflection of any point of a beam, and point out how changes of slope and differences of height in the supports may be indicated. How does the elasticity of the supports affect the question?

A timber beam 30 feet long, 10 inches square at each end with  $W$  tons at the middle, is trussed at the centre by a strut being 40 inches deep and the iron tie rods 5 inches in section. (a) Assuming a joint in the middle of the thrust and the stress in the beam. (b) Taking account of the continuity of the beam, find the thrust, the bending moment in the middle and the maximum stress in the beam. Take  $E$  for the ties to be 20 times that for the timber and neglect the strain energy in the strut.

In an experiment made on wrought-iron struts, the struts were bedded at each end, the transverse dimensions were each case 1 inch by 3 inches, and the lengths were 30 inches, 60 inches, 90 inches, 120 inches long. They buckled under loads of 13.2, 8.1, 4.42 and 1.91 tons respectively. Discuss whether they agree with the usual formula for the critical loads of struts, and, if so, find the values of the empirical coefficients; and state whether they are approximately what would have been anticipated.

A girder, 80 feet span, carries a dead load of 1 ton per foot run. A uniformly distributed load, 10 feet long, 20 tons in weight, comes on to the bridge. Sketch roughly to scale the greatest positive and negative shearing force curves, and find the limits within which counter bracing is necessary. Show also that the bending moment is greatest at any section when the section divides the load and the span into segments having the same ratio.

Explain briefly how to draw a link polygon for a system of vertical loads, so that three specified links pass through three given points.

One pier of a suspension bridge, 128 feet span, is 10 feet higher than the other, and the chain at the middle of the bridge is 14 feet below the centre of the line joining the tops of the piers. The suspension rods are spaced 16 feet

ntally, and each is loaded with 6 tons, the third rod  
he lower pier carrying an additional load of 6 tons.  
the line of equilibrium of the chain, there being no  
ing girder to the bridge.

emicircular brick arch has a span of 8 feet, the depth  
ring being 9 inches. Ascertain whether there is a  
le line of resistance which lies entirely within the  
half of the ring, the only load being that of the arch

a simple triangular roof truss of 12 feet span, the  
are inclined at 30 degs. and 40 degs. to the hori-  
and the load is 50 lbs. per foot run on each rafter.  
diagrams of bending moment, shearing force and  
for the shorter rafter. Measure the maximum values  
quantities.

a derrick crane the vertical post is supported by two  
each inclined at 45 degs., whose planes include an  
of 90 degs. The jib is inclined at 30 degs. and the  
45 degs. to the post. Determine the forces in the  
ers of the frame when the plane of the jib and tie is  
20 degs. from its mean position.

at is our latest knowledge as to the strength of a  
nt-iron shaft subjected to bending and torsion?

te the conditions of stability at a plane joint in  
ry.

e internal and external diameters of a circular section  
ollow column being  $d$  and  $D$ , find the region to which  
tre of pressure must be confined at this section, if  
s to be no tension at the joint.

plain how you would calculate the horizontal thrust  
arched rib of given form, hinged at the springings  
ntinuous at the crown, and subject to known vertical

two points  $A$  and  $B$  on the expansion curve of an  
or diagram from a steam-engine, the pressures are  
d 40 lbs. per square inch, and the volumes of the  
n the cylinder, per lb., measure 3.12 and 9.54 cubic  
respectively. The volumes of 1 lb. of dry steam  
se pressures are 4.81 and 10.29 cubic feet respectively.  
ow that any system of forces acting on a rigid body  
e replaced by a single resultant force acting at an  
ary origin, the magnitude and direction of this force  
e same for all origins, and a single resultant couple,  
agnitude and direction of whose axis are both  
dent on the origin chosen.

rces of 6 lbs. and 8 lbs. act at points  $A$ ,  $B$ , respectively,  
gid body, their directions being perpendicular to each  
and to the line  $AB$ . Find the position of the central  
f the system.

## A CHEADLE MANSION.

interesting discovery has been made at Cheadle, where  
a splendid specimen of a half-timbered building of  
iddle sixteenth century, the character of which  
itherto been unsuspected, has been restored to its  
al state. During repairs to the roof of a saddler's  
n High Street, says the *Staffordshire Advertiser*, two  
rooms were discovered which had been closed and  
ed for a great number of years. On further investiga-  
f the walls some very ancient interlaced lath and  
r division walls were seen, and the attics were found  
ssess oak mullioned windows fronting the street and  
side lights, all of which had been plastered up and  
n, probably to avoid the payment of the window tax.  
ain front of the house was found to be of fine old  
timberwork, with white plaster panels of good work-  
hip and in a good state of preservation. This old  
was also found to extend to the adjoining gabled  
e and greengrocer's shop. The attention of Mr. J. R.  
sefield was called to what had been discovered, and  
otained permission from the owners to have all the  
r stripped from the street fronts of the houses, and,  
the help of several gentlemen interested, funds were  
l, and these interesting old houses have now been  
ed to their original design, with the exception of the  
recent shop and other windows, of which the original  
ns have been lost. In the closed-up attic rooms  
hich the only entrance appeared to be through a  
vay from the next house, which had been bricked  
ere found an old shoe of very ancient date with a long  
ed toe, and several tobacco pipe bowls of the same type,  
ere made when tobacco was an expensive luxury.  
old, half-timbered houses formerly existed in Cheadle,  
shown by a water-colour sketch of the old parish church

(unfortunately pulled down in 1837) and a portion of the  
town near the Rectory, made by T. P. Wood about 1836,  
and now in the William Salt Library at Stafford. All these  
old buildings have been modernised, with the utilitarian  
shop fronts of modern times, and it is gratifying that the  
old houses in High Street have now been rescued as speci-  
mens of the fine architecture of bygone times. They furnish  
a striking ornament to the town as restored. Photographs  
taken by Mr. J. Lowndes, of Cheadle, were exhibited at the  
meeting of the North Staffordshire Field Club at Newcastle.  
They show the building as it was before the restoration and its  
present appearance, the transformation being quite astonish-  
ing. It may be added that a staircase has been constructed  
to give access to the newly-discovered rooms. It is probable  
that the building was quite a palatial residence 350 years  
ago; and it is a pity that one gabled end, which no doubt  
corresponded with the portion now used as a greengrocer's  
shop and residence, has been taken down to make way for  
the modern house and shop now occupying the position.  
However, that so much of the original house remains, and  
in so excellent a state of preservation, is matter for con-  
gratulation.

## LONDON BY-LAWS.

A WORK which will be useful to architects and others  
announced for forthcoming publication is entitled  
"London Laws and By-laws," by Messrs. Charles William  
Tagg, town clerk of Camberwell (president of the London  
Borough Officers' Association), and Louis Oliver Glenister,  
solicitor of the Supreme Court. The volume, we under-  
stand, will include all the Acts or portions of Acts of  
Parliament concerned in the government of London,  
together with the by-laws of the London County Council,  
the metropolitan borough councils, and other documents  
bearing upon London government. The indications of  
repealed or superseded sections of the statutes given include  
those dealt with under the private Acts of the Metropolitan  
Board of Works and the London County Council. A special  
feature of the work is that it will be the first book published  
embodying in a single volume the by-laws both of the  
London County Council and the borough councils, upon the  
observance and enforcement of which the preservation of  
law and order in the Metropolis so largely depends. The  
volume, which will have a comprehensive index, aims at  
being a handy compendium of London law, and from its  
contents and arrangement should prove an indispensable  
*vade mecum* for all public and professional men in London.  
Messrs. Tagg and Glenister's book will contain a preface  
from the accomplished pen of Mr. G. Laurence Gomme, M.A.,  
clerk to the London County Council, author of "The  
Governance of London," &c. Messrs. Fredk. Tarrant & Co.  
will be the publishers.

## THE IRISH COLLEGE OF SCIENCE.

THE following letter from Mr. William Field, M.P., has  
been addressed to the Chief Secretary for Ireland;—

Blackrock: November 27, 1907.

Dear Sir,—I understand that the tender for the new  
College of Science building, amounting to 110,000*l.*, has  
been almost accepted, although of this amount 40,000*l.* is  
for imported Portland stone. If this be a correct statement  
it means labour taken away from native quarrymen and  
stone cutters. There is plenty of more suitable durable  
Irish stone available, as proved by the Kingsbridge Ter-  
minus, St. Paul's Church, Arran Quay, the New Museum,  
Kildare Street, whereas the Portland stone which was intro-  
duced for carved work in the front of T.C.D. is partially  
crumbling away. In view of repeated questions, replies  
and implied promises in the House, correspondence between  
the Board of Works and the Dublin Industrial Develop-  
ment Association and with the Lord Mayor, I have also  
written to the Board. Pending their answers, I have to ask  
that you will inquire into the terms of this contract. The  
Irish taxpayers claim that a fair ratio of expenditure  
should be retained in this country.

In reply to Mr. Field, the Commissioners refer him to  
the Board's letter to the Lord Mayor of Dublin, stating that  
Portland stone will be employed only in the ornamental  
facings of the building, and that the Irish materials to be  
used will represent not less than four-fifths of the brick  
and stonework to be carried out.

#### How Architects get Work.

SIR,—I and my friend Mr. Robert Williams, of Abercwmheli, came together to your brilliant Metropolis for a few days, but he did not tell me he was writing you on the subject of "How Architects should get Work." Had he done so I should have suggested to him that he and I should have "paired," and neither of us would then have asked your indulgence to take up valuable space in your columns, for his views and mine are utterly opposed upon the subject. I agree with your original correspondent in contemning those architects who seek to obtain commissions through working upon the weaknesses of social intercourse. I will not obtrude my views further, but I would like to congratulate Mr. Robert Williams, of Alexandria, upon the forcible way in which he gave expression to opinions so fully in accord with my own.—I am, Sir, &c.,

THOMAS THOMAS.

The Manse Chambers, Glenwynydd,  
N. Wales: November 30, 1907.

#### GENERAL.

**The Distribution of Prizes** to the students of the Royal Academy is arranged for Tuesday next. The chair will be taken at 9 P.M. The competition works can be seen by the public on Wednesday and Thursday from 11 A.M. to 4 P.M.

**The Address** of the Institute of Sanitary Engineers will be 120 and 122 Victoria Street, Westminster, S.W., on and after the 16th inst.

**The Right Hon. Sir Edward H. Carson** will distribute the prizes and certificates on the 12th inst. at the Borough Polytechnic Institute at 8 P.M.

**Mr. A. Stewart Appleton**, the American publisher, is promoting an international congress of musicians, painters and poets, which should re-establish the primary claims of literature and art, and thus prepare the way for a new and better order of things. He is at present touring Europe, arranging reception committees for a mammoth excursion which he will bring from America next year to visit the art and literary centres of Europe. The expedition will leave New York about the middle of February for Rome, Berlin, Paris, London and other great cities.

**Mr. A. C. Wallingford**, second assistant at the County Surveyor's Office, Lewes, has been appointed out of 130 applicants to the post of district surveyor of Hassocks, in succession to Mr. A. E. Bowen, now county surveyor for West Sussex.

**Messrs. Crosby Lockwood & Son** announce that they are about to open at 121A Victoria Street, Westminster, a west-end branch of their business, where a selection of new and standard technical publications will be kept on show.

**The Finance Committee** of the Battersea Borough Council will recommend the expenditure of 25,000*l.* for various works to be carried out during the winter.

**Lady Stair's** house in the Lawnmarket of Edinburgh, which was recently presented to the Corporation by Lord Rosebery, was visited last week by the plans and works committee of the Council. The idea was that the Corporation would use the house as a Corporation museum, transferring to it the articles now in the museum in the Council Chambers, but it is understood that the building was judged to be not suitable for a museum. The rooms are small, and as several would have to be made use of to house the growing collection in the possession of the Corporation, it is feared that this would necessitate the employment of several caretakers in the interests of the safety of the collection. To effect any alteration in the buildings, which were restored within the last few years, would be a costly process.

**Negotiations** between the Oswaldtwistle District Council and the owner of The Rhyddings, a local mansion to which is attached eleven acres of ground, have resulted in the house and land being secured for the town. The owner first offered The Rhyddings to the Council for 5,000*l.*, but has now agreed to accept 3,700*l.* The hall has been untenanted for some years. It might serve as a free library or public baths. The grounds will require comparatively little laying out to make them an admirable public park. They are within easy reach of the centre of the town.

**Messrs. Allen & Sons, Ltd.**, billposters, brought a case in the Edinburgh sheriff court against the refusal of the Corporation to grant licenses for twenty-three sites. The Corporation examined the sites and refused the licenses on the ground that they would be detrimental to the appearance of the city. The Corporation opposed the appeal of Sheriff-Substitute Guy and, on further appeal, Maconochie granted licenses for the sites in question. The licenses are, with a single exception, for a period of five years. The sites are gable and other hoardings in Haugh Street, Dalry Road, Gorgie, West Bryson, Polwarth Gardens and in other parts of the city.

**The Chancellor of the Diocese** has decreed a fast for the rector and churchwardens for the rearrangement of sittings, &c., in Hexham Abbey, necessitated by the building of the new nave. The proposed alterations include the restoration of the existing choir stalls and the sedilia. The completion fund now amounts to 4,502*l.*

**The Sale** of the art treasures of the late Stanford White, of New York, of the firm of Messrs. McKim, Mead & White, the victim of the Madison Square Roof Collapse tragedy, has been completed. It is announced that the amount for which the collection has been sold is 82,000*l.*

**Lady Baker**, of Ranston, is compiling a list of clay pits and brickyards in Dorset, in order to have the clays analysed with the object of tabulating their varieties and capacities. Her ladyship has set on foot a movement for the encouragement of modelling among Dorset peasantry, in order to counteract the attraction of the towns. She thinks that more general use might be made of the many beautifully tinted clays of the county for domestic and other work, in which the peasantry might profitably be employed in their spare time.

**The Council** of the Royal Institute of British Architects are prepared to receive applications for the appointment of a secretary. Applicants, who need not necessarily be architects, should possess some literary capacity, a thorough knowledge of French and a working acquaintance with other modern languages. Age not less than about 25 or more than about forty-five years. The secretary will be required to devote his whole time to his official duties. Salary 500*l.* per annum. Any canvassing will be disapproved. Particulars may be obtained by writing to the Secretary, 9 Conduit Street, W., not later than the 21st inst. and applications must be received by December 31.

**It is Proposed** to hold an electrical exhibition in Manchester in October, 1908. The Corporations of Manchester and Salford and many other towns in Lancashire and Cheshire have given their support to the scheme. It is thought that the influence of a more comprehensive exhibition than that held at Olympia, London, in 1905, will have a beneficial effect on the industry in the area of which Manchester is the centre, and it is desired that those interested in electrical manufacturing and contracting should have the opportunity of discussing the final details of the scheme. A meeting of the electrical trade will be held to-day (Friday) at the room of the Manchester Chamber of Commerce. Another meeting, convened by Sir William Preece, will be held in London on Thursday next at the Hôtel Cecil, with Sir William Preece in the chair.

**The Executive Committee** of the promoters of the proposed technical college for Aberdeen and the North of Scotland have issued an appeal for 100,000*l.* for the combined purposes of buildings, maintenance and bursaries, being felt that such a sum—in addition to the donations already promised—is necessary to place the college on a sound financial footing. Architecture and the associated trades will be suitably provided for. It is proposed to arrange for an intimate co-operation with the art schools with a view to full attention being given to the application of art to industrial products and the artistic crafts.

**Mr. Banister Fletcher** will lecture on Rheims, Rouen, Amiens and Beauvais Cathedrals at the University of London, South Kensington, on Monday, December 8 at 8 P.M.

**The Bishop of Kensington** on Saturday, November 28, unveiled a stained-glass window which had been fixed in the chapel of the Ealing and Old Brentford Cemetery to the memory of the Rev. H. F. Nixon, M.A., late vicar of St. Paul's, Old Brentford, and chairman of the burial board. The subject of the window is "The Raising of Lazarus." The work was designed and executed by Mr. E. Staunton Watkins, of Ealing.

## THE WEEK.

THOMAS GUTHRIE was a distinguished Scottish man who died in 1872. He was admired for his services towards the amelioration of the poorer classes. It has been a surprise to his admirers that his statue is not to be seen in the former notabilities of Edinburgh. His son, GUTHRIE, of Liverpool, has arranged with Mr. POMEROY for a marble statue of his father. Marble is preferred, although bronze is generally considered better adapted for a figure in the open air. The statue, including a granite base and foundation, will probably amount to 2,000*l*. The site will be in the street opposite the foot of the Castle, and in line with the other statues. Dr. GUTHRIE has a pleasing countenance, and there is no doubt Mr. POMEROY will do justice to it. Marble stands well in the Edinburgh atmosphere, although several of the street statues are in bronze. Mr. GUTHRIE proposes to give a sum of money in order to provide for the cleaning of the statue in perpetuity. That is a plan which deserves imitation in similar cases.

A SUB-COMMITTEE of the Rhyl Town Council recommended that the plans of Messrs. LITTLEWOOD & SONS be adopted for the new pavilion which it is proposed to erect. At the last meeting of the Council one of the members objected to the plans on the ground that a tower which formed part of the design would only be useful for storing scenery and machinery required for stage purposes. They contemplated providing for dramatic entertainments. It was stated that Messrs. SMITH & MAXWELL's plan should be referred to. It was stated that a contractor would put Messrs. LITTLEWOOD's scheme for 8,100*l*., while Messrs. SMITH & MAXWELL's would cost 8,800*l*. There were twelve members who, when the two designs were put to voting, were in favour of Messrs. SMITH & MAXWELL's plans, while only three supported Messrs. LITTLEWOOD's. It is necessary for the ratepayers to secure the approval of the majority. It cannot be estimated that for 8,800*l*. a great work will be erected, apparently Rhyl cannot afford a larger outlay.

On Monday the Court of Appeal delivered judgment in the case of CHAPMAN v. SPENCER. The action arose out of the unhappy circumstances which were connected with the collapse bodily and mentally of Mr. GOODACRE, the architect. The plaintiff was a son of the late Mr. SPENCER, and the defendant was the son of Mr. GOODACRE. The plaintiff was the owner of the estate of J. BURLEY. Mr. SPENCER obtained the contract for the erection of five houses in Leicester for Mr. BURLEY. His tender was accepted only for the brickwork, but he subsequently obtained a contract which included work by other tradesmen amounting in all to 4,370*l*. Mr. BURLEY, it was alleged, had paid the whole of the amount due under the contract. Unfortunately for himself, although the houses were drawn out for the plaintiff, they were handed over to Mr. GOODACRE. It was alleged that Mr. SPENCER, instead of passing the cheques on to the plaintiff, had them cashed. But owing to the condition of the architect the transaction could not be fully investigated. It is not customary for an architect to come an intermediary, and an effort was made to prove that Mr. GOODACRE must have been the agent of the plaintiff, or that the plaintiff had so acted that he was estopped from saying that the architect was not his son. Mr. GOODACRE undoubtedly paid certain sums to the plaintiff, but there was 150*l*. due to him for which he held a bill, and there was also money due to subcontractors for which the plaintiff was more or less responsible. The claim was therefore for 465*l*. 13*s*. 9*d*.

Mr. Justice WALTON, who heard the case, decided in favour of the plaintiff, and the Receiver therefore appealed. Lord HALSBURY delivered the judgment of the Court, and said the case was one of those in which two persons had been placed in a false position through the frauds of a third party. The architect was not the plaintiff's agent, and therefore the case had been properly decided. So the appeal was dismissed with costs. The action exemplifies the varied responsibilities which may come upon an architect and the trouble which ensues when he ceases to be competent to conduct his affairs even for a short time.

It is remarkable how touchy some of the members of the London County Council become whenever anything is said concerning the Works Department. No part of the Council's business was less adapted to be directed by amateurs. They may have had most virtuous intentions, but they were not infallible, and serious losses occurred not from dishonesty but from a deficiency in ability to deal with affairs of construction. It is said that improvements have been introduced in the working of the system, and it was therefore right to ask an able accountant like Mr. EDWIN WATERHOUSE to report upon the accounts and generally upon the position of the department from a commercial point of view. The report has been completed. According to the finance committee, "in it Mr. WATERHOUSE makes several suggestions on matters of detail connected with the working of the department, and we are in communication with the works committee upon these suggestions. As, however, it appears to us desirable that the report should be in the hands of members of the Council without delay, we are sending a copy to each member of the Council, and we think that the report should be placed on sale." The simple remark about selling copies of the report was interpreted as an effort to have it suppressed, and much time was occupied by the meeting on Tuesday in exhuming old charges against the Works Department and treating them as calumnies. Mr. WATERHOUSE's report is only a preliminary one, and yet it recommends alterations in the working of the department. He was not able to contrast the cost of work executed by the Council's workmen and the cost when executed by outside contractors. Until that information is obtained, the public will not be in a position to decide whether the Works Department is an economical institution or the reverse. A large majority, however, approved the recommendation of the finance committee. The report will be obtainable. But it is well to have it made known that the most important part has yet to be prepared.

"BREAKING STRAIN" is a phrase commonly used in describing the ultimate effect of loads on girders. But according to Professor ARNOLD, of the Sheffield University, it is an absurdity. Breaking strain really means the total elongation, and yet in test sheets it is usually expressed in tons per square inch. The correct phrase is "maximum stress." The Professor objects to the number of test sheets which are issued, and on which the erroneous idea is conveyed. He divides stress strains into four classes—first, the range of proportionality; secondly, the yield-point range; thirdly, the range from the yield-point to the maximum stress; and fourthly, the range from the maximum stress to the breaking stress. In the course of his lecture Professor ARNOLD contrasted the results obtained about thirty years ago by Professor WOHLER and those derived from the testing machine which is now employed in the Sheffield University. The difference was so large as to create doubts about the earlier experiments. He proposed to abandon the maximum stress as the base for the factor of safety, and to take instead the yield-point as a datum line, deduct from this four tons, and on the remainder to use a factor of safety of at least three to one.

## FAILURE TO DISCOVER DEFECTS.

ALTHOUGH the liability of architects to their clients is unquestionable, it is remarkable how few are the cases in which damages have been awarded for negligence in any form. This is suggested when it is found that the misdeeds of engineers, surveyors, brokers, road inspectors and others have to be referred to in law books in order to exemplify what might be done by architects. The result of the action brought by Mr. C. E. KEYSER, F.S.A., against Messrs. CHARLES TRASK & SONS, builders, of Norton-sub-Hamdon, Somerset, and Mr. EDWARD DORAN WEBB, architect, of Salisbury, for damages for alleged breach of contract and negligence in regard to the building of the chapel at the Masonic School for Boys, at Bushey, Herts, has in consequence, unusual interest.

Apart from the legal aspects of the case, *i.e.* if in legal matters a process of abstraction can be admitted, must be considered the enthusiasm of the plaintiff and the disappointment he suffered. This imparts a personal note to the transaction, which, if it did not affect the proceedings in court, is closely connected with them.

Our readers are aware that Mr. KEYSER is the author of the standard inventory of mural and other painted decorations which were produced in this country prior to the latter half of the sixteenth century, and of which portions have survived. It represents many years' devotion to the subject, besides visits to buildings in all parts of the country. The author in a most generous way handed over his notes to the Government, by whom they were printed for the benefit of schools of art. When investigating the remains of wall-painting in so many hundreds of churches, Mr. KEYSER could not help considering the cause of decay and destruction. He found that the preparation of the wall surface originally had much to do with the endurance of the paintings, and that colours vanished owing to the decay of plaster. In fact, a novice in mural work should not begin operations without a careful study of Mr. KEYSER's valuable discoveries.

When, therefore, Mr. KEYSER resolved to build a chapel at the Royal Masonic Institution, Bushey, he was only consistent when he decided that it was to exemplify mural painting. Mr. PHILIP H. NEWMAN, an artist who has had a long experience in all kinds of decorative work, and whose *Zenobia, a Prisoner in a Triumphal Procession*, was reproduced in *The Architect*, was selected. The plans of the building were prepared by Mr. E. DORAN WEBB, and the contract was given to Messrs. TRASK & SONS. The cost was stated to be 5,906*l.* The foundation-stone was laid by the Duke of CONNAUGHT, and work was commenced in May or June 1900.

According to the specification, the walls were to be of solid brick with a flint facing, and the plastering was to be executed in good chalk lime. It is well to remember that Mr. KEYSER in his book does not recognise a single example of old work in England as "fresco," and therefore a surface with plastering of the kind would be likely to obtain his approval. Mr. NEWMAN considered that chalk lime, if dry, was a suitable surface for his figures. A great deal of information has been obtained concerning Italian practice in such matters, but there is nothing to show what time was allowed in a building before one of the English Mediæval artists began to paint on the walls of churches. We are without precedents for guidance. Mr. NEWMAN assumed that after two years the walls would be ready, and moreover he employed a drying mixture.

He completed his paintings on that theory. Mr. DORAN WEBB, however, said that when the contract was signed he was not aware of the commission to Mr. NEWMAN, nor did he tell the painter that the walls would be ready for him in 1901. What he told Mr. NEWMAN was that at least two years must elapse before any decorative painting could be done, and he was

surprised when he heard that the painter was, in the summer of 1902. The paintings early exhibited blotches which were ascribed to moisture, and flakes of colour fell off. The minimum damage, according to the painter, estimated at 200*l.* We mention here that the jury gave a verdict against the architect for 68*l.*, and against the contractors on account of the repainting, or 20*l.* more than NEWMAN's estimate.

An examination of the walls became necessary in order to discover the cause of the dampness. KEYSER entrusted Mr. A. W. ANDERSON, architect, with the task. According to the evidence Mr. ANDERSON found chippings of flint, broken brick, bits of wall, and ashes, apparently without any connecting material between the outer facing of the walls, and he maintained that the space should have been filled with flint chippings and mortar only. The brickwork was not of uniform thickness as specified. The finding was confirmed by a foreman.

As a final certificate had been given, containing the contractors contended that there was no fault against them, as they had satisfied the specification. But Mr. Justice DARLING would not attend to the point, nor to one relating to the length of time which was allowed to elapse before action was taken. Witnesses on behalf of Messrs. TRASK testified that rubbish was not used. The foreman said he had no complaints from the clerk of works; he said that some soft bricks might have been used on the interior, but they were safe so long as they were not exposed to frost. Another witness said that the painting should not have been attempted earlier than four years after the walls were completed. Mr. Justice DARLING considered it was for the jury to decide whether Mr. DORAN WEBB had been negligent in not having the painting executed in two years. The Lordship also left the jury to decide whether Mr. ANDERSON's evidence the specification was not complied with, and suggested that it cost 117*l.* to repair the walls, and that the reparation of the wall-paintings would probably cost 200*l.* The jury decided in favour of the architects, and assessed the amount to be paid by the architects 100*l.* and by the contractors at 217*l.* We have mentioned the apportionment for the paintings; the remaining 97*l.* was payable on account of the walls.

It seems to us that the case should have been decided out of court. By the exercise of a little tact on the whole cost of litigation would have been saved. Charges against architects and contractors which are likely to be magnified by the public would not have been heard. Let it be granted that Mr. KEYSER was a "faddist"—a kind of client which is not always welcomed by architects or contractors. But in his enthusiasm was guided by knowledge, and in his arrangements he was a man of business and a gentleman. Unquestionably the mural painting, as a sort of hygrometer, and dampness, in ordinary cases would not receive much attention, but it became distressing to him, for it injured the work in which Mr. KEYSER took a special interest. Did the dampness arise? A foreman of the jury admitted that he wrote a letter in which he stated that he was well watched, but he was up to the eyes in people. He could not explain to the Court what was in his mind, but it is allowable to suppose that at the Chapel the workmen imagined they were not doing good work. If a few soft bricks and flint chippings were put in a place from which they should be excluded, it would be considered a "lark," and one which might be played for the first time in walling. The fact that the paintings might not be anticipated nor the action of a playful mood.

Mr. KEYSER ought in courtesy to have put the matter fully before his architect. But we cannot expect an enthusiast for wall-painting will remain content with a series of his own devising appears to be

a similar fate to the mural paintings executed years ago. He therefore decided on calling in an architect. But he invited Messrs. TRASK to be at the examination and through them he invited Mr. WEBB to attend also. Having received the certificate the contractors supposed their liability at an end and they declined to communicate with the architect on the subject. Whether in the independent examination defects were magnified, as is not known, we need not inquire. The statement bore the sanction of the Court and the jury acted on it. But variations which became necessary could as well have been carried out by Messrs. TRASK and supervised by Mr. DORAN WEBB without making the public case will, however, be useful if it should show everyone connected with building that they do not possess peculiar privileges and have not immunity from the consequences either of carelessness or of ill-

There is a peculiar danger in the creation of such a precedent as is involved in the case. England has been unusually unsuccessful in attempts at figure-painting competitions. Many causes have been assigned to explain the phenomena. At one time it is the quality of the ground, at another the ground, at a third the peculiarities of the atmosphere. The builder has hitherto been responsible for the failures. He may be in less fortunate. In the Bushey case not the least was attached to the painter. The careless work of the builder was considered to be unquestionably the cause. With that prepossession in their minds they were indifferent not only to any doubts about the process employed, but they attached no value to the possibility of any weakness arising from eagerness in the commencement of the work. We cannot expect that in the future builders will be as indifferent to the past to the building of walls on which paintings are to be executed. *KEYSER v. TRASKER, SONS & CO.* will, therefore, possess an interest which will be memorable.

## THE CONVENTION OF AMERICAN ARCHITECTS.

The conditions under which architecture is practised so nearly correspond in all civilised countries that any alteration which may be proposed in one country has interest in the others. Great Britain and the United States have so much in common there is, in fact, even more resemblance between the conditions of practice in both countries than can be found elsewhere. The proceedings of the Convention of the American Institute of Architects, which has just been held, for that reason almost seem as if they took place in an English or Scottish town instead of in Chicago. One of the first subjects to be considered was the question of the committee on competitions. It is recommended that, wherever possible, an architect should be employed without competition. If, however, competition is unavoidable, three kinds can be recognised, viz. limited, open and mixed, the third comprising those where certain subjects are invited, but all are at liberty to take part. It is not deemed advisable at present to impose any code. But it is urged that an architectural committee should draw up the programme and that an architect, or preferably a jury of practising architects, should assist the employer in making the award. As to the cost, the amount to be expended should either be sufficient for the purpose or there should be no cost stipulated. The programme should be in the form of a contract relating to the award of the work to other payments. Whenever practicable the architect and the adviser should confer with the employer and agree upon terms which are to be binding on all. In limited competitions there should be a premium sufficient to cover the preparation of the designs demanded. In open competitions the pre-

miums should be adequate to cover the expense of at least five schemes. In mixed competitions there should be premiums to the invited competitors as well as additional amounts representing the cost of at least five sets of drawings, the money to be distributed among the authors of the best five schemes and not to be confined to the uninvited competitors. It is also proposed to have it declared unprofessional for any member to knowingly submit designs in competition with another member unless under conditions approved by a disinterested professional adviser.

The recommendations have to be approved by a special committee. They differ in some respects from the conditions adopted in this country. Mixed competitions are almost unknown among us, and until a decision is given in the competition for the London County Hall, it cannot be said whether the form is advantageous. The ownership of the designs does not appear to be referred to. That, however, is an important point, especially when we remember the numerous trusts and companies for contracting to be found in America, and who could easily find opportunities to use premiated designs in another State. But American architects may be relied upon to look after their own interests.

We have stated when describing the proceedings of other Conventions that the inscription of architects' names on buildings was under discussion. The committee in their report say that the Institute should recommend its members to place their names with the Institute initials upon their buildings, "leaving to the individual member to select his best work in design and execution, to be signed, and bearing in mind that this is a privilege which, if sparingly and judiciously used, will be a credit to the Institute and will do much towards raising the standard of the practice of architecture in this country." An allied subject was the use of the "Institute initials, A.A.I.A. and F.A.I.A., by the members upon their cards and in the signing of buildings and plans, as eminently proper and tending to the wider recognition of the Institute." That recommendation was also adopted.

The American contract system has obtained proportions which are in keeping with the magnitude of the United States. There is an apprehension that a power which is so great may not care on all occasions to be subject to the control of architects. A committee was appointed to consider the subject in relation to architects, but the members appear to have been overwhelmed by the vastness of their enterprise. In the report they say that they have given the subject thoughtful consideration, and have discussed the matter in its various phases with members of the Institute and with a number of those engaged in contract work. It has also been discussed with officers of corporations who are actively interested as owners of buildings, so as to get the point of view of those experienced from the standpoint of the owner.

They feel that the subject is one which requires an amount of time and correspondence, and, in short, what might be called an educational campaign, from which results cannot be expected within a short time. The consideration of the subject has been postponed until next year. The expression "an educational campaign" is by itself sufficient to indicate the growth of the new power, for generally a contractor's circumstances are not supposed to be a mystery to an architect.

Another case which suggests a decline in authority is the report on building laws. The committee would like to see greater uniformity in the conditions. But they realised that local conditions must be recognised. It is not only from authorities opposition is to be expected. The National Association of Fire Underwriters has issued a code regardless of the existence of the American Institute of Architects. The committee say that it has been carefully prepared, but that some of its regulations are unnecessary and burdensome. If the Institute were to draw up a standard code it would be in conflict with

the underwriters. What is proposed is that the Association, the builders and the Institute should each appoint a committee, and that a conference between them should be held. The result will be watched with interest. The position is remarkable and suggests some of the opposing elements which are at work, each endeavouring to become supreme.

Under the title of "The National Advisory Board on Fuels and Structural Materials," the United States Government has appointed several specialists to make experiments. At St. Louis investigations as to concrete and reinforced concrete are in progress, and already about 40,000*l.* have been expended. The report on the subject has not been completed.

To the majority of the members the report of the committee on revision of schedule of charges was, we suppose, the most important subject brought before the Convention. The expenses of architects, as in other professions, are increasing, while the fees, which were based on a condition of things which were more moderate, remain unchanged. It has been found that in many of the larger cities, especially in New York, the fees are too low. In cities of the intermediate class they are considered adequate except in work for residences. In the smaller towns and in the South the fees are considered sufficient for all classes of work; indeed, in many instances clients consider them to be excessive. The chapters of New York and Cleveland recommend a rate of 6 per cent., the San Francisco chapter would charge theatres on a  $7\frac{1}{2}$  per cent. basis, the remaining chapters are satisfied with the present 5 per cent. rate except for residential work. An increase on residential work is very generally conceded as imperative. The rates proposed vary from 6 per cent. to  $7\frac{1}{2}$  per cent., or a sliding scale beginning with 10 per cent. on the first 10,000 dollars of cost, and averaging in one instance as high as 8 per cent. on an operation of the value of 100,000 dollars.

The New York chapter would give a client the option of a percentage basis or of an honorarium plus expenses. It is only in the largest cities of the East that experts are employed. But the architect's duties are not diminished by their aid, rather they are increased. It is therefore claimed that the architect should be paid his usual fee in addition to whatever has to be paid for the specialist's services. The committee, however, advise changes to be undertaken with caution. The existing schedule may be said to have established itself and has attained value in the Courts. It is the expression of a professional body in contrast to that of a trade union.

The recommendations were considered by a commission of the Convention, who came to the conclusion that the minimum charge, based on the total cost to the owner, should be as follows:—

On the first 10,000 dols. of cost, or any part thereof	10 per cent.
On the second 10,000 dols. of cost, or any part thereof	7 "
On the next 30,000 dols. of cost, or any part thereof	6 "
On any balance of cost	5 "

The fees are to comprise services in preliminary conferences, studies, working drawings, specifications, full-sized details, direction and supervision of work. It was proper to make an additional charge for residential work; for landscape architecture, furniture, monuments, decorative and cabinetwork and alterations the minimum charge is to be 10 per cent. There is also to be an extra charge where the building is conducted under more than one contract. Consultation fees are to be paid in proportion to the services rendered. Where the same set of drawings and specifications is used for more than one building erected at one time under one contract, the usual charge is made for the first building and a modified charge for repetitions. But this does not apply to recurrent parts on a single building, for

which the full commission is charged in the total. The above fees are not to cover alterations and additions to contracts nor negotiations for site, disputed walls, right of light, measurement of work or fair contractors. Should a specialist be required there is to pay for his assistance. Travelling expenses are to be defrayed by the owner. Drawings and specifications as instruments of service are to be the property of the owner.

The payment of the architect, they suggest, is as follows:—Upon completion of the preliminary studies, one-fifth of the entire fee; upon completion of working drawings and specifications, two-fifths; the remaining two-fifths being due from time to time in proportion to the amount of work done by the architect in his office and at the building. The architect is to be entitled to payment for furniture or other articles purchased in his direction, or any material or work already upon the ground or which may come into the owner's possession before the architect's commission is computed. In the event of the suspension of the works the basis of payment to be as follows:—Preliminary studies, a fee in accordance with the character and magnitude of the preliminary studies, working drawings and specifications, three-fifths of the fee for complete services.

The supervision of the architect is to mean such supervision by him or his deputies as he finds necessary to assure whether work is being executed in general conformity with his drawings and specifications or directions. He is to act in constructive emergencies, to order necessary changes and to define the true intent and meaning of the drawings and specifications, and he has authority to stop the progress of the work and order its resumption when not in accordance with them.

Such an alteration as has been approved is a step on the part of American architects, and arc in other countries, and more particularly in England, must desire that the end will be attained. If such a change is not likely that fees in England will be allowed to remain as they are. So many American clients pay to be amateurs they should know the difference between good and bad architecture, and if the architect has gained reputation will not give their services less than the Institute fees, we cannot suppose that substitutes would be found among men whose buildings would not be adapted to contain such paintings and statues as are now found among private owners in many parts of America.

## ROYAL ACADEMY SCHOOLS.

ON Tuesday evening the president of the Royal Academy, Sir Edward Poynter, who was accompanied by a number of the academicians, distributed the prizes to the students of the Royal Academy Schools. The following is a list of the prizes and prize-winners:—

*Historical painting*—David playing before Saul, gold medal and travelling studentship (200*l.*), Francis E. Fitzjohn Crisp; *proxime accessit* and extra prize of 50*l.*, Frederick Bird. *Landscape painting*—A Passing Storm, gold medal and scholarship (50*l.*), Marianne Harcourt. *Portrait painting*—W. Robilliard. *Painting of a figure from the life*—Silver medal, first, Francis E. Fitzjohn Crisp; silver medal, second, Christian Mary Wilbee. *Painting of a head from the life*—Silver medal, first, Christian Mary Wilbee; silver medal, second, Hilda Fraser Parker. *Design for the decoration of a portion of a public building*—Shipbuilding, prize of 50*l.*, Norman James Little. *Design in monochrome for a picture*—The Angel releasing St. Peter. The Acts, Charles Armitage prizes, first (30*l.*) and bronze medal, Lennard; second (10*l.*), Francis E. Fitzjohn Crisp. *Cartoon of a draped figure*—Polyhymnia, silver medal and prize (25*l.*), Margaret Isabel Dovaston. *Set of drawings of a figure from the life*—First prize (20*l.*) and bronze medal, Ronald Hamilton Greig; second prize (15*l.*), Francis E. Fitzjohn Crisp (disqualified owing to having received the same prize before); third prize (10*l.*), Christian Mary Wilbee. *Perspective drawing in outline* (open)

ers and sculptors only)—The Little Cloister, West-  
er Abbey, looking through an arch to the other side,  
medal, no competition. *Composition in Sculpture*—  
les and Antæus, gold medal and travelling student-  
2001.), Ferd. Victor Blundstone. *Model of a design*—  
ape of the Sabines, first prize (301.), Frank Gatter;  
prize (101.), Ferd. Victor Blundstone (disqualified  
to having received the same prize before). *Set of  
models of a figure from the life*—First prize (201.) and  
medal, Percy George Benthall; second prize (151.),  
Frazer Rock. *Design for a medal*—A design for a  
in honour of Diana, with a head of Diana on the  
e, silver medal and prize (101.), George Alexander.  
of a bust from the life—Silver medal, first, Millicent  
m; silver medal, second, Frank Gatter. *Design in  
cture*—Design for a College Chapel, gold medal  
ravelling studentship (2001.), William Harvey. *Set  
chitectural drawings*—The Vestry of St. Lawrence  
silver medal, first, David Wickham Ayre; silver  
second, Alan Binning. *Set of architectural designs*—  
(251.) not awarded. Set of drawings of an archi-  
tural design—first prize (151.), Alan Binning; second  
(101.), Frank Leslie Attwell. *Original composition in  
ent*—Prize (101.), no competition. *Perspective drawing  
line* (open to architects only)—The interior of the hall  
e Brewers' Company, silver medal, Sidney William  
e. *Architectural design with coloured decoration*—Part of  
ide wall of a chapel to be decorated with marble  
ing and majolica tiles, silver medal, Harry Herbert  
l. The Landseer scholarships in painting and sculp-  
of 401. a year each, tenable for one year, have been  
ed—in painting to Samuel Rahamin Samuel; in  
cture, to Ferdinand Victor Blundstone and John Angel.

#### The President's Address.

udents of this Royal Academy,—I undertook in my  
discourse to lead your minds in the direction of a higher  
of the possibilities of art than is prevalent among the  
rn schools of painting, whether in our own country or  
d. I endeavoured to emphasise my arguments by  
ing on the high standard which was ever before the  
the Greek artist in his treatment of the human form  
the embodiment of the divine idea, and to the high  
nit of perfection to which they raised it by investing it  
the noblest attributes of beauty and intellect; and  
by a reference to the culminating period of the  
n Renaissance, when a belief in the beauty of humanity  
means of enhancing the expression of the divine element  
erted itself after a long period of asceticism, during  
h the conception of the human body as an encum-  
be to be subdued by the sternest self-mortification  
ailed and spread, as has been said, like "an epidemic"  
ugh the Christian world—a view not only destructive of  
form of artistic expression, for that in itself was an  
gence to be eschewed, but carried to such excess as  
nately to become impracticable, and so lead to more  
al views of monastic life. This became in its turn the  
ery ground of a revival of art destined to take a place  
second in artistic excellence to the great art of the  
ks; in other respects occupying, indeed, a higher  
nd in that a more exalted view of the divine spirit and  
e destiny of man provided artists with loftier themes  
compelled them to the expression of deeper emotions.  
is only through the fortunate preservation of a few frag-  
ts of sculpture that we are able to judge of the com-  
mate perfection of which Greek art was capable in the  
ment of the human form; but there is no reason to  
ose that their greatest painters were in any way inferior  
their great sculptors, Polycletus, Phidias, Praxiteles or  
ppus in their several styles, or that painting failed to  
w its usual development from Polygnotus, the contem-  
ary of Phidias, but whose works were probably more  
aic in style, painting being slower of development than  
pture, through Zeuxis, whom we may perhaps con-  
r the Raphael of the Greek school, to its complete  
urity under Apelles and Protogenes, whom we  
tempted to couple with Titian and Correggio as  
ing carried the qualities of colour and modelling to the  
nest pitch of excellence. From the wonderful sense of  
uty and style to be observed in the decorative works  
ch have come down to us—I mean the wall-paintings  
n which the houses of the ancients were so profusely  
orated and known to us through their preservation at  
culaneum, Pompeii and Rome—we may infer that the  
nters, of whom these decorations give but a faint

reflection, at least equalled the most famous artists of the  
fifteenth and sixteenth centuries.

My consideration will now be of some points on which the  
works of the modern schools, as distinguished from the  
antique, bear on present practice, and happily the student has  
not far to go to make himself conversant with the whole  
practice and development of the art of painting from the  
revival at the beginning of the thirteenth century to the  
present day. The National Gallery contains examples of every  
painter of the first rank of every school to the beginning  
of the nineteenth century, with the one exception of  
Watteau, who, as treating the trivial and artificial subjects  
which were in vogue in France at the beginning of the  
eighteenth century, with sound taste and an exquisite  
refinement of execution and colouring, may, perhaps, be  
classed in the first rank. Besides this complete present-  
ment of the leading spirits of painting, no artist of any  
note is absent from this the most representative of the  
great European collections, with again the exception of some  
of the secondary French artists of the eighteenth century.  
There is therefore the fullest material for study in any direc-  
tion to which the proclivities of the student may lead him.

To the great masters I have constantly drawn your atten-  
tion in my addresses to the students on these occasions, and  
in so doing I am only following the example of my great  
predecessor, the first President of this Academy, who in his  
discourses continually holds them up as examples to the  
students of his time—not for imitation, he was careful to  
say, and I am careful to repeat, but for study—study of  
their methods of work, study of the qualities that make  
them great and distinguish them from each other and from  
inferior artists. No one had a greater admiration for those  
great men, and no one was further from any slavish imita-  
tion of them, but in the great qualities which distinguish  
Sir Joshua Reynolds's work may be traced the powerful  
influence which they had on his practice. The students of  
this Academy, indeed, have another advantage which the  
painters of Reynolds's day did not possess—I mean in the  
annual exhibition of the works of the old masters held in  
these galleries. The main object with which these exhibi-  
tions were instituted by my predecessor, Lord Leighton  
was to give the students of the Royal Academy the oppor-  
tunity of seeing pictures of celebrated masters of all schools, to  
which otherwise they were not likely to have access; and with  
few exceptions all the great private collections of England  
have passed, by the liberality of the owners, through  
these rooms. The collection of works of art to form such  
exhibitions becomes annually more and more difficult,  
for besides that it is becoming more rare to find examples  
hitherto unseen, a multiplicity of similar exhibitions has  
sprung up of recent years. It is not therefore surprising if  
owners of fine works have in some cases become tired of  
constant applications, and decline to part with the treasures  
which after all are the greatest adornment of their houses.  
Nevertheless, these exhibitions still remain of the highest  
interest to students of painting, and if I have entered on  
this slight digression from the more purely didactic nature  
of an address to you, it is to point out to you the prime  
object for which our winter exhibitions were instituted; to  
direct your special attention to them as a means of instruc-  
tion, and to hope that you will profit by them. Pictures  
which, like those of the National Gallery, are always  
within your reach may in time become too familiar to  
awaken enthusiasm, though to me the interest and pleasure  
which I take in them is as fresh as when I first knew them,  
and their unrivalled beauties appeal to me constantly with  
more and more force whenever I look at them. However  
this may be, there is undoubtedly an attraction in seeing  
works hitherto unknown or unfamiliar, which gives a fresh  
impulse to the artist and the student by exciting his spirit of  
emulation and presenting fresh aspects of his art, and in this  
way our Old Masters Exhibitions should gain your attention.

Nor is it only the inspiration that you may derive  
from the splendid results of such painters as Titian,  
Veronese or the earlier painters of the Venetian school,  
or from the severely beautiful productions of the Floren-  
tines, or from Raphael and his predecessors and fol-  
lowers, or from the great Correggio—more rarely to be  
seen in this country—or from the dignified realism of  
Velasquez and the painter-like qualities of Murillo—a  
master of the soft suffusion of gradations in flesh and  
drapery—or from the brilliant splendour of Rubens, and  
the elegance and character in the portraits of his pupil  
Vandyke, or again from that marvellous phenomenon  
Rembrandt—standing by himself on a pedestal of unattain-  
able achievement, without predecessors and with no

followers worthy of name, for he is inimitable—and from the whole school of Dutch artists, it is, I say, not only the inspiration you may derive from the contemplation of such works of genius which will benefit you. For although the desire which they create in the minds of all who are worthy of the name of artist to emulate their authors in their choice of noble and beautiful themes and a lofty and dignified treatment of them, and as a source of inspiration in this sense they are an indispensable adjunct to study from nature, although to feel such a desire is one of the most profitable effects to be derived from a constant reference to great works of art, there is a further, and to the student a more important use which such studies may subserve. If you search the National Gallery from one school of painting to another up to at least the middle of the eighteenth century, you will never find bad or incompetent work (I omit, of course, from this reflection a few painters of the third class whose claim to be represented is admitted on antiquarian or historical grounds). Every painter, whether he be painting saints on a gold background, or bacchanals dancing in Arcadian scenes, or even boors drinking in a tavern, has a complete mastery of his method and his material, and has no hesitation as to how he should begin, proceed with, or finish his work; he has learnt his trade; he is in fact an artist and not an amateur.

What I have always tried to impress upon you is that the artist is the man who knows how to do his work. The methods of work differ with different artists and in different schools. The method of Raphael differs from that of Titian, the method of Rubens from that of Rembrandt, and so on *ad infinitum*, but they agree in this, that they know what they want to do, and have acquired by early study and incessant practice a perfect mastery of the technical side of their art. This mastery once gained they were free and able to give full expression to their ideas in a technique which, while it excites our admiration by its perfection, is never used as a mere display of skill. With the masters of the great schools of painting technical skill was the means of expression, not an end in itself; they knew that an artist cannot express himself fully until he has acquired a complete mastery over his material; they brought their technical powers to a perfection which seems in many cases almost unattainable, and they took care that the pupil should have the skill of his craft at his fingers' ends before he was employed on any work of permanent importance.

This would appear to be incomprehensible to those who judge of the qualities of a picture by certain obvious evidences of a more or less competent dexterity of handling. That the great art consists in concealing the art is a very trite quotation, but it is none the less an eternal truth. The painting of Titian stands at least as high as that of any painter. It is so absolutely perfect and yet so unobtrusive, and produced apparently with so little effort, that it does not in itself attract attention. That of Velasquez is equally unattainable, but its very simplicity is deceptive. The way in which it is done is easy to see, and leads many artists to think they can do the same without going through that long and laborious study from nature of which the numerous early works of Velasquez give proof; with Rembrandt also, the third of the great trio, the method is discernible; but the simple and easy handling of these the greatest of painters was only acquired, with Rembrandt and Velasquez at least, after passing through a phase of almost uninteresting dryness and years of incessant and laborious study. With Titian the case is different; he was rather the culminating point of a school which for a century had been producing work of the highest beauty, than an isolated example, and his early work, though wanting in the boldness and facility which he acquired later, reflects the glorious traditions of a series of painters gifted with the most exquisite sense of colour, and ever aiming more and more at technical perfection. To this inheritance of tradition he added a deeper appreciation of the characteristics and aspects of nature, whether in man or in landscape, and in his earliest works, such as the beautiful picture at Antwerp of the Pope presenting one of the Pesaro family to St. Peter, he reveals himself as a master at once. Such is the value of tradition handed down through a succession of great artists from master to pupil. Some of the early productions of Rembrandt and Velasquez are, on the other hand, almost repulsive in their hardness and ugliness, and their development into the stupendous artists that we know was slow and extended over many years, probably because they had no great tradition behind them and had to make their way for themselves.

We have here in England no continuous school of

artists who have handed down an unbroken tradition and this to the student is an enormous disadvantage. He is drawn this way and that by opinion and example, listens to the flattering doctrine that he must be himself, must see nature in his own way, that the learner learns the better, that to know how to draw with precision and accuracy is to be academic (terrible word), and that to be trained in the methods of his art is to destroy originality. That such doctrines are bearing fruit is fear, only too evident in our exhibitions, and I fear in our own schools. A sudden degeneracy in the most important course of study in our schools, that of drawing from the living model, has set in within the last five years, and it is to be accounted for in no other way than the loose untidy method of work has taken the place of careful and sometimes beautiful studies of certain more than ten years ago, and its disastrous results are surely be, and indeed are, reflected in our exhibitions.

It is not too much to say that the most striking feature of the pictures in the National Gallery is, as I have already impressed on you, the perfection of workmanship where to be found. Take the Dutch school for instance. No one can pretend that the work of the Dutch painter is academic or that it is not founded on the closest and most intimate study of nature, and yet where will you find greater perfection of execution or more precision of drawing than in the works of this school?—a school where the practice of their best painters, finish in modelling, the most subtle gradations of colour and light and shade carried to the highest degree without apparent labour. You must have noticed among the works of the Dutch painter in our last winter exhibition two pictures by Jan van Goyen which especially illustrate my argument on this point. You will I believe find in the forthcoming one a further selection of Dutch pictures worthy of your study.

I do not ask you to attempt to rival the marvellous productions of Van Eyck, Memling or Gerard David. That when such patience was possible as is required to produce such miracles of minute completion in every detail appears to have passed away; the conditions of life are the same as in the fifteenth century; but the painter, Ostade or Teniers or Da Hooghe should be without the reach of any artist's ability if, but only if, in his student years he has learnt habits of neatness, accuracy and precision. I cannot but contrast with works such as those to which I have alluded an exhibition which I visited recently of a newer school, where not a picture had power to attract attention by the way in which it was done. That charm in a picture, the charm that arises from seeing the artist knows his craft and takes pleasure in it—what Ruskin calls "preciousness" of execution—was to be absent. A loose indefinite treatment with that effusive dexterity which is meant to conceal general ignorance was the leading note of the whole exhibition. I am far from saying that this is universal, but it is typical of the general indifference to good work, so prevalent in many quarters both at home and abroad at present, and to which carelessness of drawing as I have noticed to be one of the increase in these schools of recent years cannot but contribute. The tendency to shirk difficulties, to draw form in a careless and slovenly way, to cover want of close study by a display of clever sketching, is the worst that can afflict the student. Unless he can define his forms on paper with a clear outline and definite gradations of light and shadow, he can never define them in his own mind. My predecessor in this chair, Lord Leighton, used to say that unless a study can be modelled from it is of no use, and this applies more to the student than to the accomplished artist, and may be credited with the knowledge necessary for carrying it to its completion any correct indication of form. Indeed it was the method of the great artists of the Italian Renaissance, who, by long practice in highly-complex studies, combined with an intimate research into the anatomy of the human body, were so impregnated with knowledge of the figure in all its aspects that from a few sketches as can alone be made from a figure in motion they were enabled to produce a work complete and accurate in all its details.

In referring as I have done to the life drawings in our school, I am speaking of a general tendency to be observed not to the particular sets which have gained the prize, indeed, if they had not stood out from the others, showing more scholarlike qualities they would hardly have gained the rewards; but the tendency to substitute the best clever sketching for careful study is too prevalent, and in this our students appear unable to escape a

movement fostered from outside. To be told that is superfluous is advice which it is easy to follow. Advice is infectious, and the microbes spread with rapidity.

It is pleasant to turn to the subject of the gold medals. In sculpture it is, I think, generally admitted among members who judge your works that the competition is of a high average. Judging from the general excellence of the groups, in more than one of which the considerable difficulties which the subject involves have been very successfully overcome, the condition of the winning school leaves little to be desired. The architectural school also, under your visitors, who are devoting to it most energetic attention, is taking on a new life, and a number of drawings which has gained the medal shows the excellence of the instruction given. In the competition for the gold medal for painting, those two which I have already rewarded, and which ran each very close, stand out conspicuously from the rest. The painting which has gained the gold medal gives evidence of more thought in the treatment of the subject; its boldness and expression both of David and Saul are just, and well expressed in the contrast of their characters, by the simplicity of the one and the gloomy, dark spirit of the other. The composition is unnecessary crowded with figures, but it is a natural and comfortable spirit on the part of a young artist to make his work interesting by filling it with incident, though somewhat inappropriate in the present case. The second work, of brilliant qualities of painting, almost too brilliant for a beginner, unless there is solid knowledge behind it, has the defect of showing only the back of David, as an actor in the scene, is at least as important as the face, in fact, too much the study of a model with an attempt to give appropriate characteristics to the quality of the inspired youth. Truth to fact is not truth to nature. Truth lies in the true and adequate expression of the idea inherent in the subject; it is only to say that the painting may be an excellent one from a model without conveying the idea of David. Saul, on the other hand, is well conceived and well painted. I make these criticisms not to disparage the work in question, which, I consider, do great credit to their authors, but as remarks of a general character applicable to compositions of the kind. Both these competitors show hope, a great future before them.

I have made myself at all clear in these remarks you have understood that you can never rise to the height of a true artist unless you have the power which nature alone can give. Without this genius will but degenerate into eccentricity and fail to make good use of its natural faculties. The drudgery of the early stages of art is distasteful to those who cannot keep a steady purpose before their eyes and look forward to the result. No man can "be himself" unless he has the power to produce as in him, and how is this power to be gained in the painting, any more than in any other craft, but by the training which trains his mind, his eye and his hand?

#### MR. JOHN SWAN, R.A.

In a country where wild animals abound that the paintings and sculpture of Mr. Swan can be best appreciated. Mr. Edward Roworth, a local artist, contributes to the following account of the art and ideals of Mr. Swan who is engaged on the Rhodes memorial statue near his own home:—

It was on a stately Newlands lawn, beneath the eternal shadow of Table Mountain, that I first met John Swan, R.A., sculptor and painter. It was a memorable experience for me. Years ago I had seen Mr. Swan's work, and had fallen under the subtle spell of its consummate art, and I now found that I was meeting one of the greatest and most living artists in contemporary art. But the intensely sympathetic human personality of this great artist put me at ease at my ease, and I felt that I could talk freely and without hesitation, give expression to my own crude thoughts. John Swan has the simplicity which belongs to greatness and achievement. We talked of South Africa and the beginnings of her art. The directness and truth of Mr. Swan's observations were convincing and impressive. He looks forward with confidence to the creation of a South African school of painting, with original and national methods of expression. The spirit of South Africa rarely calls in vain to the soul of the artist; certainly Mr. Swan has fallen under its spell. In picturesque language

he tells of the great spirit of the land which seems chained, Prometheus-like, to her mountains, awaiting the touch of the great artist which shall set it free and reveal its soul to the world. The country appeals to him as being grandly elemental—he would get away from the towering pines, the shady oaks and even the stately blue-gums, and would be among Africa's own children, the magnificent Kafir-booms, the glorious proteas, or the shimmering forests of silver-leaves. As Mr. Swan talked, he impressed upon me the strange charm which this country has, owing to the fact that no trivial details encumber its large structural features. He spoke of the wonderful foregrounds of vast rolling plains with sharp and stately ranges in the broad, blue distance. Keenly modern, and filled with the new vision of impressionism, he is captivated by the federating power of our flooding sunlight, by which all the vastness and the luminous colour of our landscapes sink into a marvellous unity and become atmospheric and profound.

Mr. Swan has clear and definite opinions upon the training and ideals of the young artist. He is to follow nature. We are not to ask "how such a one did it," but we are to look upon nature with the fearless eye of a child, and endeavour to see her truly and see her wholly. Mr. Swan would warn us in South Africa against being led away by the method of seeing nature peculiar to the lens of the camera. The camera can never take the place of the artist. There is much, from the scientific side, which is of value in photography, but it cannot be art; there is no human emphasis until the artist's power of selection, which is largely emotional and individual, comes into operation; there can be no art, although there may be a splendid record of scientific fact.

In the limits of this short article it is unfortunately impossible to give, in Mr. Swan's own words, the interesting history which he gave me of the great impressionist movement in modern art. He traced it, laying particular stress on the technical side of the movement, from the mighty genius of Velasquez, the first of the moderns, through the great Dutchmen; and so by way of England, with her glorious galaxy of painters—Gainsborough, Reynolds, Constable and Turner. Constable carried the torch to France and set fire to the immortal spirits of the Barbizon school and the later paysagists, Monet, Sisley and Pissaro, the painters of vibrant light and air. The message of modern art is now exemplified in England by such world-renowned artists as Swan, Brangwyn, Clausen and Stott.

I have left to the last a reference to Mr. Swan's regard and reverence for the great French sculptor, Rodin. Mr. Swan declares Rodin to be the greatest living name in art, a wonderful genius who has stood alone, and by his keen vision and great soul widened the bounds of man's achievement in the arts. Nothing is more heartening than to hear the praise of one great man for another—for if Rodin has attempted what was before unattempted, so also has Swan, and has also as nobly achieved. John Swan is only with us for a season, but his wise words and generous optimism will be a spur to our young artists to go forward in sincerity of spirit towards their goal of self-expression in their art. As he says, "You are not hampered by the traditions of schools—you are free in your choice of nature." It is a great privilege to have such an artist and thinker amongst us—one who, in taking leave of us, says, "I, passing this way, salute the solemn stillness of your solitudes and the fierce sunlight that beats over the plains of South Africa."

**The Competition** amongst architects for Perth's new city hall promises to be a keen one. Nearly 150 architects from all parts of Scotland and England have applied for copies of the conditions and particulars, and lodged their fee of one guinea. This number is far in excess of what was anticipated. Premiums of 50, 30 and 20 guineas are to be awarded. Plans must be lodged by February 1.

**The York City Council** at their last meeting adopted the following resolution:—That Mr. Frank Watson Spurr be appointed surveyor of this Corporation, acting in its capacity of Municipal Council, at a salary of 400*l.* per annum as from November 1, 1907, with an increase of 50*l.* on May 1, 1908, and a further increase of 50*l.* on November 1, 1908, to a maximum salary of 500*l.* per annum; his duties to include all such duties as are prescribed by the Council and the streets and buildings committee from time to time, but not any duties in respect of the Ouse navigation; that he shall hold such appointment during the pleasure of the Council, devote the whole of his time to the duties and do not engage in any other work.

## NOTES AND COMMENTS.

THE late MARIO RAGGI, the sculptor, was one of the last survivors of the old school. He was a native of Carrara, where he was born eighty-six years ago, and in the local school where dexterity counts for much he was successful, and was thought to have a prosperous future before him. Then he studied in Rome, and was for a long time assistant to TENERANI. Like many another foreign artist, he imagined that fortune awaited him in London, where he arrived in 1850. RAPHAEL MONTI, of Milan, was at the time prominent, and was afterwards connected with the sculpture of the exhibition of 1851 and of the Crystal Palace at Sydenham. RAGGI joined him as his assistant. In 1854 he exhibited a statue of "Innocence" at the Academy. Afterwards he became assistant to MATHEW NOBLE, many of whose works are to be seen in the public places of provincial towns. Then MARIO RAGGI opened a studio of his own, and after an interval of twenty-three years again became an exhibitor at the Academy, his "Compulsory Education" appearing in 1877. From that time until 1886 he contributed with some regularity; most of the works were busts such as Cardinal MANNING, Cardinal NEWMAN, Lord BEACONSFIELD, Lord JOHN MANNERS, Dr. WARDE, JOHN HARVEY and LIONEL BEALE. The figure of Lord BEACONSFIELD in Parliament Square is his work. He produced memorials of Queen VICTORIA for Hong Kong, Toronto and Kimberley, and a statue of Mr. GLADSTONE for Manchester. He was a typical Italian sculptor; his busts and figures are successful as likenesses, and his statues "Matutian" and "On the Sea-shore" were admired, for they were easily understood. But it could not be said that he exercised much influence on the sculptor's art in England.

THE earthquake in Jamaica not only disturbed the surface of the island and destroyed buildings, but it overcame also the officials, and was not without its effect on the Home Government. That may explain the absence of a scientific investigation into the phenomena from which lessons for the future might be derived. Dr. CORNISH, who was in Kingston at the time, delivered a lecture before the Royal Geographical Society on Monday evening, in which he said that a Commission of three should have been despatched at once to the island, the Commission comprising a field geologist, an expert in building construction, and a hydrographer. A complete record was necessary of all damage to buildings, and an exploration for new faults or movements of old ones, particularly in the somewhat difficult country in the eastern portion of the island, which was both mountainous and thickly wooded. The guidance which the resulting report would have furnished respecting methods of building, and perhaps also as regards the best sites for houses in Jamaica, would in itself have more than repaid the expense. The report would further have been a valuable guide in other parts of the Empire situated in seismic areas. From his own observation Dr. CORNISH said:—In addition to any jarring or bumping there was a strong swell, literally a ground swell, running from west to east or east to west. Thus walls that faced east or west were generally overthrown, while the fall of a wall facing north or south was exceptional. Of the former many more fell to the east than to the west. On the latter, though they mostly remained standing, the effect of the rocking was to produce a double system of cracks. As the wall returned westward from its eastward excursion the eastern end of the wall was, so to speak, left behind, and on the return vibration in an eastward direction a corresponding crack opened at the west end. These cracks often crossed each other diagonally. Walls in which cement mortar had been used stood much better than those with only lime mortar. The defect of all stone and brickwork, however, in respect to earthquake shock was want of tensile strength,

hence the advantage of reinforcing concrete, & strips of metal, which would give a fibre to make otherwise too brittle. The disadvantages of height and of top weight were also abundantly evidenced. Any departure from simplicity of usually brought about additional damage, Gothic and Classic cornice being almost equally unsuitable in earthquake countries. In face of these restrictions would seem that architects in regions of seismicity would have to rely mainly on the skilful proportion of spaces for the production of artistic effect must be allowed, however, that if the information desired by Dr. CORNISH were forthcoming it is doubtful whether it would be adopted. After the Great London the citizens who survived returned to the ruins of their old dwellings in spite of all the advantages which streets laid out on WREN's plan would offer. San Francisco people are not afraid to risk the damage of spots in which the seismic force was active, and Kingston they would probably be equally foolish. It would, however, be an advantage in a scientific sense to have such a report as Dr. CORNISH describes.

THE village of Saddlescombe is near Battledown, Sussex. It has lately acquired interest among archaeologists from the discovery of pit dwellings which are of an unusual kind. There is no question they were used as dwellings, because charcoal ashes were found in them as well as some flint implements. Mr. E. ROBINSON discovered them almost accidentally. The pits were probably roofed in with tree boughs covered with clay. All the pits faced the east, as though to secure the shelter of the downs from the south-west winds. A Roman coin dated A.D. 141 was found in a shallow flint bed adjacent to the site of the pit dwellings. Other discoveries were human teeth, crumbling portions of a skull and a piece of pottery. Large quantities of oyster shells of coarse texture were unearthed, and one of the larger pits hundreds of shells of the common land snail were found in the crevices between the flint slabs, the snails evidently having sought this shelter for hibernation and failed to find a way out. Another chamber in a pit was filled with gallop-holes of moles' bones. A few bones of cattle and tusks of boars were close by. One peculiarity was that the hearth was within the hut instead of outside. It is supposed that the dwellings belong to the Bronze Age. The early dwellers may have realised the value of local ironstone long before the Romans came, for there is evidence that they occupied Saddlescombe and the vicinity.

AN Architects' Technical Bureau has been established. The advisory committee consists of Mr. ALFRED W. S. CROSS, G. HUBBARD, W. A. PITE, J. SEARLES-WOOD, KEITH D. YOUNG, G. BERTRAM BULL, JOSEPH CROUCH, H. L. GODDARD, PAUL OGDEN, E. SEWARD. The offices are 11 Bloomsbury Mansions, Hart Street, London, W.C. The Bureau is intended to supply a want frequently expressed by architects. It is proposed to establish a central bureau, where complete and reliable information can be obtained on practical matters, such as building materials, appliances, manufactured goods, new methods of construction, &c., where expert advice will be available on the technical requirements of the profession. It will render the services of experts to assist architect subscribers, especially the younger practitioners, in arriving at sound conclusions relative to difficult points on ancient limitations and easements, and upon knotty points in agreements and contracts. For those architects who enter into conditions, the Bureau will have the respective sites inspected and obtain full particulars as to surroundings, materials, &c., as well as photographs of the adjacent buildings, if any. The Bureau, we understand, already over 500 subscribers amongst architects in all parts of the country. The period for joining original subscribers (10s. 6d. London, 5s. provinces) has been extended to the last day of the year.

## ILLUSTRATIONS.

ABBEYSTEAD, LANCs.

DENHOLME, WALTON-ON-THAMES.

A house, which is situated on a site of about 1½ acres of land in Oatlands Chase, Walton-on-Thames, was completed about four and a half years ago. It stands at right angles to the public road, in order to obtain the south-east aspect for the principal front towards the garden. A plain substantial family house was required at a low cost, and it is left to the architect to beautify the walls with creepers. The house is faced with purple clamp bricks of varied pattern, with red dressings, and the roof is of tiles. The accommodation comprises on the ground floor a large reception hall, dining-room, drawing-room, billiard-room and the usual offices; on the first floor, seven bedrooms and a dressing-room with two bath-rooms, and on the top floor, five bedrooms, bath-room, and a study, &c. The house is warmed by radiators connected to the ordinary grates, the heating being supplied by a "Duplex" boiler also supplying the domestic hot-water service. The system was carried out by Mr. E. P. MILNE, of 15 Craven Street, London, and proves very effective. The stoves are mostly "Heaped Fire" variety, by Messrs. BRATT, LONDON & Co., Mortimer Street, London, W. The architect was Mr. FRANK HAWKEY, of 81 Brighton Road, Brighton, while the architect was Mr. WALTER E. DAVIES, A.R.I.B.A., of 22 Buckingham Street, Strand, who also arranged the laying out of the garden.

THE GODBER MEMORIAL CHURCH HALL AND PARISH INSTITUTE, HUCKNALL TORKARD, NOTTS.

THIS building, which was opened on November 16, 1906, by the Duchess of PORTLAND, has been built for educational and social purposes on a site presented by the Duke of PORTLAND, and adjoining the old parish churchyard on the west side, with frontages of 100 feet on West Street on the north side and West Street on the south, the maximum width being 120 feet and the depth 138 feet, the area being nearly an acre. The ground was fairly level throughout three-quarters of its extent, and the remaining quarter sloped down to Ogle Street with a fall of 15 feet. Most of the ground on this slope has been removed to form a recreation ground for the building, a large portion of the excavation having been done by voluntary labour of the parishioners. Advantage was taken of the fall of the ground in planning the building by giving an entrance on the level of the upper floor. The portion of the site facing West Street, which had been laid out as a recreation ground, as well as the main entrance on the ground-floor level facing Ogle Street, a carriage drive at the west side of the building also giving access from Ogle Street to the recreation ground on the higher level. The building has been designed on economical lines, to give a maximum amount of accommodation at a minimum cost. The ground-floor is chiefly devoted to recreation rooms, the largest room, measuring 29 feet by 29 feet, being divided by folding partitions into a reading-room, a lecture-room and a games-room. Also included are a billiard-room 29 feet by 26 feet (with a billiard table), lighted on two sides, occupying the north-east corner, and a lads' club-room, the same size, at the south-east corner. A dark-room for photography and lavatories are also provided on this floor, and a room for the honorary secretary and committee is situated close to the entrance. Two staircases give access to the upper floor, which is also approached directly from the recreation ground on the higher level, as before mentioned, and this floor is mostly occupied by a large hall 80 feet by 37 feet, capable of seating about 100 people, exclusive of the raised and recessed platform, which will seat about fifty more. The hall is divided into three portions by folding partitions, the middle portion adjoining it at one end is a music-room, and at the other end (next the platform) is a

suite of service rooms, consisting of a kitchen, scullery, store-room and serving-room, with a large store-room above the kitchen. Ladies' lavatories are provided on this floor. The heating chamber is placed in the basement, next the Ogle Street front of the building. The walls are built of local brick, faced externally with red brick and Darley Dale stone dressings, and the roofs are covered with Welsh slates, the ventilating turret being of wood roofed with lead. The floors are of concrete (the upper floor being carried on steel girders and joists) and covered with "terrazzo" throughout. The joinery is of canary wood, unpainted internally. The boundary wall is of local stone, most of it quarried on the site, the front coping being of Darley Dale stone, and the railing and gates being of wrought-iron. Canon GODBER was the largest contributor to the building fund, and his death having occurred shortly before the laying of the foundation-stone by the Duke of PORTLAND on August 1, 1906, it was decided to call the building "The Godber Memorial Church Hall."

The total cost, including laying out the grounds, forming a miniature rifle range on the east side, furnishing, and all fees and expenses, was 5,680*l.* Mr. LOUIS AMBLER, F.R.I.B.A., of London, was the architect, Mr. D. DAVIES the clerk of works, and Messrs. THOMAS FISH & SONS, of Nottingham, the builders.

A PAIR OF COTTAGES.

THIS pair of cottages was designed by Mr. E. W. POLEY, A.R.I.B.A., of 6 Lancaster Place, Strand. The external walls are finished in roughly trowelled stucco and distempered a light tint. The roof is covered with grey green slates and the chimney-stacks are red brick.

CATHEDRAL SERIES.—SOUTHWARK: THE NORTH TRANSEPT FROM SOUTH.

## CHICHESTER CATHEDRAL.

IT is stated by the Dean of Chichester that the architect, Mr. Somers Clarke, endorsing the opinion of the surveyor, Mr. Gordon Hills, has recently informed the restoration committee that it will be necessary to spend at least 5,000*l.* on the campanile and roof of the cathedral, the lead of which is very ancient and is getting dangerously thin; and, if the work of restoration is not speedily taken in hand, serious damage to the structure is likely to ensue. This comes on the top of several other recent efforts—such as the entire rebuilding of the north-west tower, which had long been allowed to lie in ruins—and these have severely taxed local resources. At present 1,600*l.* is being expended on the repair of the stonework of the campanile, which is the only one in England now remaining detached from a cathedral church. As is well known, the central spire fell down in 1861, and its rebuilding was a very costly affair, carried out when Dr. Hook was Dean. Including something over 60,000*l.* for that object, more than 117,000*l.*, principally raised in the county of Sussex, has been expended on the fabric. The Dean adds:—"We are so far in a very fortunate position, inasmuch as the architect tells us that, if we can succeed in raising this, comparatively speaking, modest sum of 5,000*l.*, it will be the crown to our labours, and that the whole building may then be considered to be sound and in complete repair, which will make us to a certain extent the envy of other chapters less fortunately situated. None the less, at the moment this repair of the roofs is a hard nut for us to crack, and we feel that the need is urgent for the reason given above. The Dean and Chapter have contributed and are contributing as largely as they are able out of their sorely diminished revenues to the repair of the cathedral, which has no fabric fund, and the heavy calls upon local generosity which the raising of the above-named large sum has entailed have well-nigh exhausted local possibilities. There must be many among the thousands who come here to view our glorious buildings who would be willing to help us did they but know of the need which has arisen. The Duke of Richmond and Gordon is the chairman of the repair and restoration committee, and subscriptions will be most gratefully received either by him at Goodwood, Chichester, or by the Dean."

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. Walter Cave, president, in the chair.

Messrs. E. H. Buckingham, H. G. Warlow and H. S. Rogers were elected members.

Mr. C. Wontner Smith (hon. secretary) announced that a meeting of the A. A. Camera Club would be held on December 19, when Mr. E. W. Harvey Piper had promised to contribute an address, entitled "An Hour at Southwell."

On the motion of the President, a hearty vote of thanks was passed to the Musical Society for providing excellent entertainment at the recent conversazione.

Mr. PAUL WATERHOUSE read the following paper, illustrated by plans, entitled:—

## The Laying-out of London.

In bringing before you this essay on London, I would have it understood that I disclaim all initiative in the matter. Twice in two years I have been asked to read a paper on this subject; but I have never applied myself unasked to any of the problems which it involves. I make these prefatory disclaimers, not by way of disarming criticism—on the contrary, I welcome it for this very reason with the less embarrassment—but simply because I should like it known that I have never for an instant had the effrontery to look upon myself as in any way specially qualified to offer advice on the topic of London street planning. Whatever freak of the imagination has coupled my name with my subject, I may truly say that it is a flight of fancy which took its origin entirely in other brains than my own. When your summons came to read a paper on laying-out London I was bewildered. Was I to take my start from the great green field of prehistoric Middlesex and relate the chronological process of London's plan? Was I to put before my eyes the chart of present chaos and doctor it? Or, finally, was the laying-out to be in another sense? Was I, in fact, to take the weary but dearly-loved sufferer just as she is and lay her out—for burial? Presumably, what you require of me is some suggestions as to how London might have been laid out and how she may still be amended.

Now, apart from practical difficulties, which, in a matter of this kind, must never be admitted as obstacles (for practical difficulties mean money difficulties, and money is bound to be forthcoming for real public needs), the great question that besets the handling of this problem is, Where, in point of history, are you going to begin? We want (or rather we are going to have) a new London. You will understand as I proceed that I say this from no love of novelty. Indeed, I would sooner not say it, for if you were to come to me as magicians and were to say, we will give you leave to live in whatever London you choose to ask for, I should have no hesitation whatever in ordering the London of 1800. By favour of your magic I would pave it with wood, I would grace it with a selection of really good horse omnibuses, with hansom cabs, and with odourless taximeter four-wheelers. For convenience in transit, I should encourage two-thirds of the inhabitants to settle in the Garden City, when the rapid increase of population would probably demand the transfer to Letchworth of all the motor omnibuses.

Seriously then, and apart from all jest, the London I should prefer, and that you would prefer, is a certain old London; but this we know we cannot have. Our London of the future must be, whether we like it or not, a new London; we are making it new every day. There was, you know, once a man who when asked what he thought of Rome said, "It will be a nice place when it's finished." Rome, so far from being built in a day, has taken 2,000 years in the process, and is still at it hard. But all cities aim at a certain—of course, unattainable—completion, and the question for us (as for the Romans) is, Will ours be a nice place when it's finished? In other words, if we were to be told that there was to be no anxiety about cash, but the job must be done in twenty-five years, could we conceivably make a decent piece of work out of our enterprise?

And still the inquiry, Where are we to begin? has its force. First, to begin very far back, let us ask whether London is in the right place at all? Were I to offer you, as I have offered myself, no already tangled problem, but a clean map of British pasture land and forest, with nothing on it but rivers and contour lines, the chances are that you would begin by placing London where it is. There is good reason now, as there was in old time, for planting our capital on one of our largest rivers, and in so placing it on that river that it shall coincide with the lowest point at

which a bridge can conveniently span the water, doing you not only minimise the severance of shore, which is one of the main drawbacks in a rivers, but you also allow the navigation to reach the unimpeded by lower bridges. Again, in choosing the Thames as the river rather than the Severn, the Mersey, or the Humber, you place your city in its nearest relation to the rest of Europe. So let us have no qualms in London somewhere near London Bridge. Our difficulties are simple so far, now the difficulties begin.

The next question, ridiculous as it seems, is still asking, because it opens out a matter of principle vital to our task. Shall we, while retaining the site all, any or none of the existing streets and buildings? If you come to think of it, a man might conceivably rather reasonably, argue thus:—"London is a very convenient city and needs remodelling."

London buildings, even the best of them, are perishing and will be outlived by London herself. Though it is true that no scheme of improvement, unless aided by earthquake or fire, would proceed by means of wholesale destruction, yet there must still be a gradual and eventually complete renewal of all London buildings.

An obsolete building of important functions is more easily superseded by one on a new site than by one on the same site. Therefore, plan your London of the future irrespective altogether of London present or London past. This is, I repeat, what your man of sense might say.

But, gentlemen, I have stated this line of argument clearly and convincingly as I can, only to tell you that I do not one with which I have little or no sympathy. It is difficult to get rid of the reverence for the past, which I hope to show in the first principle, and by no means as a secondary consideration, London as a modern aggregate cannot be regarded as an entity identical with London of the past; and this reverence, so far from being a hindrance to us or an obstacle to righteous conservatism, will, I hope, prove to be a solution of part of our problem and the best bulwark against the temptation, by which I mean our reverence for certain buildings, which should be unassailable and impregnable. It has nothing to do with any theory of London improvement, and does not adopt as one of its first principles the sterile belief that certain buildings, and perhaps certain streets, are inviolable.

And now, with an appearance of inconsistency—only an appearance—I want us to ask ourselves apart from all question of existing buildings, would it be an ideal plan for a city of the size of London, placed upon the site of London? Assume, if you please, that you have offered as unalterable data the Thames and the moorless undulating ground on its north and south banks. On this ground, cut in two by this tortuous stream, you lay out to the best possible advantage, and with full knowledge of modern requirements, a metropolis measuring nine miles by six miles.

It will first occur to you that a purely rectangular plan has certain advantages, owing partly to the fact that it involves a minimum of waste ground, and partly to the economy of labour resulting from right-angled construction. But you will soon discover, on applying the rectangular treatment to your Surrey and Middlesex, that the river plays havoc with it, and cuts up the "T-square and set-square" formation by its tortuous nonconformity. You will next remember that the other objection to the right-angled street plan, namely, that in the course of business or pleasure a man's path may take him in directions not necessarily coincident with your parallels and rectangular lines. He may need, in fact, to move diagonally as the bishop moves in chess, and then his course in your rectangular city becomes one of much indirectness and of much wasted time. The rectangular city is then not perfect without diagonal streets, and diagonal streets waste the virtue of the right-angled formation. Meanwhile, your study of the river's course has been putting another idea into your head. There will, I need, as you soon observe, of many bridges. Starting from the east end of the town with a bridge as low down-street as the river traffic will permit without interference, and assume that bridges will be wanted throughout the whole course of the river at a more or less uniform distance apart of, let us say, half or three-quarters of a mile. For bridges, you further observe, should, for the double sake of economy and beauty, cross the stream as nearly as may be at right angles. The roads which cross the bridges should for some distance be approximately straight, and con-

you will have begun your city plan by planting several main roads which, owing to the sinuosities of the river, are at oblique angles to one another. Again, the river takes in its course through central London a more or less approximately to two segments of contrary flexure tangential to one another, it is at there will be two points, one on the right bank and the other on the left, where these roads, or several of them, will meet as at a focus.

Working with such a formation, I have put together in a plan what I suppose would be a likely and reasonable plan of the main streets of London, if the town were designed on its present geographical site and with the best knowledge of its present-day needs. A little later I will enter into some of the details of this plan, but for the moment I want to make it understood that in my rough plan as an ideal London, I am not by any means branding it as a desirable one. The opportunity of designing a brand new metropolis of the size of London is not an artistic blessing, but an artistic calamity. A town so built would be full of convenience, but also full of ill-ordered prim propriety which every true lover of the city would regret. To take the most obvious aspect of the plan, there is the question of straightness. No one but an old-fashioned landscape gardener has the moral courage to be deliberately crooked; a new city would in many grounds the duty of straightness, and we do our best to evolve from it the beauty of straightness. We should glory in length, in vistas longer than the eye can see, in roads of arrow-like purpose that speed us on from spot to spot, but we should lose that happy simplicity which is justified only by the causes (generally the necessities of history or geography) which bend the streets of our older cities. Look how Holborn or the Strand, the first one set of frontages into view, and then the other, and remember that every swerve in the street's course tells the story of some bygone episode, some forgotten or remembered obstacle or influence that has twisted the track.

A perfect city would have many imperfections. My plan, to be sure, is far from perfection; but it shares at least some of the disadvantages of a newly planned town. It is forward for a purpose, but not for the purpose of its own realisation.

Jerusalem was built as a city that is at unity in itself; London was not so built. Even 200 years ago London was a conglomeration of different towns—to-day it is a conglomeration of numberable towns and hamlets. You have merely to open the "High Street" in the directory to realise, by the number of streets bearing the name, how many once distinct townships are now part of a greater unit; for the "High Street" was at one time the chief thoroughfare of each separate system.

Let me return from this digression to my imaginary plan, and let me explain that I have made a moderate attempt to embody on it some of the special devices which are necessary at the intersection of main thoroughfares in a modern city. The question of interest in regard to the plan will be just this, Does it bear any resemblance to the plan of London? You will notice that, though rather subdued by other features, the two foci, or hubs, at which the radial roads connected with the bridges meet are really the chief factors in the positions and directions of many of the streets. One of these marks the heart of the West London residential district; the other lies south of, and is on the easy touch of, the business centre. What shall we call each focus? The elementary idea of a small and compact town—such a town as stands on cross-roads in a rural district—is to place at the meeting of the roads the town place, the town hall, the church and, indeed, all the public buildings and spaces which represent corporate life. A town is of such a size that its public life can be accommodated by four or five buildings, and if the functions of public buildings are so limited that their contiguity is a convenience, and not by reason of congestion of traffic an inconvenience, then such a collocation is in all ways desirable. But in a town of the size of London it is not convenient to have a great company of public buildings of different functions close together, nor is it wise to have a multiplicity of roads to converge on the site of a single building or group of buildings. Such convergence is rather than helps access.

At the same time a focus, or road centre, which brings a number of thoroughfares together, with no object in view but convenience, is useless. What, then, is the suitable function of a group of roads? Why, obviously a railway station.

A radial focus, remember, implies not merely convergence on a point, but easy distribution from that point. If we were to place two of our main termini at these two foci, we should have done much to justify the radiations by providing an easy and direct run from each station to any possible part of the town. Then, again, you will notice as a special feature of my town, that there are two main roads east and west. One entirely on the north side of the river; the other running from the Royal Palace right away to the docks. I might add a third south of the Palace road, and there should be a fourth in the north of the town. Now, I could go on for some time describing the points of this Utopia, and I shall return to them again; but I want to get to my question, What relation, if any, does it bear to London of to-day?

Gentlemen, you will join with me in astonishment at the discovery that, in a great number of important features, our modern London is closely allied to this imaginary sketch. Buckingham Palace is nearly where it ought to be; the two foci, or road centres, are where you would expect them, or nearly so. The Houses of Parliament, Scotland Yard and St. Thomas's Hospital stand for the administrative buildings which I have placed as riverside sites, and the County Council is on the way to fill a missing link in my Utopia with the new building in which so many of you take an antagonistic interest. But though coming astonishingly close to my ideal city in some particulars, our London just misses its theoretical fulfilment by a narrow margin of error, which just makes all the difference.

The south focus, for example. On what do our radial roads converge? The simplicity of the convergence, to begin with, is broken up by a hesitation between the two points. One point is, or was, the obelisk at St. George's Circus—a blameless, and to my mind admirable structure, which, overborne perhaps by an undue concentration of attention, has been induced to retire to the gardens of Bedlam. The other point is the Elephant and Castle, likewise blameless, no doubt, but very irrelevant.

Now, if you will think for a moment on cities in general, you will realise that it is the natural business of roads in a normal city to diverge as they leave the town, not to converge. This convergence of ours in London is due quite directly and undeniably to the river curves, and it is the business of the city planner to give what is a geographical accident a real function. If some intelligent foreigner were to spend a day in stopping omnibuses on London Bridge, Southwark Bridge, Blackfriars Bridge, Waterloo Bridge and Westminster Bridge, with polite inquiries as to whither they were bound, he would receive the unanimous and startling answer, "Elephant." Now, this is all quite wrong and improper. The Elephant and Castle are, as I said before, a blameless couple; but they exist at that point merely because the roads converge (and cross) there; the roads do not converge because of the Elephant. What ought to be at the Elephant site is Waterloo Station, or rather, the South London combined lines general station. Abolish Cannon Street, Charing Cross and Holborn Viaduct stations, and construct a large general station at the Elephant site, or rather at my connected focus, and what have you gained? And what lost?

You have certainly removed your station a little further from the centre of the town than the three or four which it supplants, but you have placed it where it obtains a much readier access to the roads leading to all parts of the town, and you have thereby prevented the railway road traffic from unduly blocking one or two of the bridge roads.

Moreover, my great east and west road, which is not far from it, is a sign that the new station is within much easier reach than is the present Waterloo of the true centre of the town. My threefold avenue, to the details of which I shall shortly draw your attention, is no idle fancy. It is part of a suggestion which, in my opinion, has real force, that we have got to recognise the importance of the Surrey side as we have never done before. For 500 years London Bridge was the only bridge across the Thames. Since 1750 one bridge after another has been built in succession, but we as Londoners have, for some reason or other, never realised the accessibility of the south shore, nor its propinquity. Dwellers on the right-hand bank, whose daily work is on the left, naturally cross the Thames twice a day, but how many people are there who recognise that the straight course between Westminster and the Bank runs through, or very near, New Cut? And how many know that the Mansion House is closer to Bermondsey than it is to the Old Bailey? The Thames is to this day a great gulf, like the gulf fixed

between Dives and Lazarus. Westminster Bridge is so placed that a continuation of its direction eastward would lead direct to Rotherhithe and the Surrey Docks, touching the Thames bank at Cherry Garden Pier on the way, and giving very easy access on its north side to the roads leading over the various bridges. Such a road would form a spine—or, if you will, an artery—practically central with the city's activity, running due east and west, a direction which, for some reason, is apparently more important than north and south, and not only linking both shores, but also directly connecting the heart of the residential quarters with the heart of the commercial.

And now a word as to the possible construction of such a street. The real difficulty with our London traffic is caused, not only by the way in which slow vehicles impede swift ones, but also by the inevitable holding up of progress at the points where traffic intersects. If drivers intent on long-distance journeys could only be quite free of obstruction by vehicles that want either to stop or turn aside, or, again, by others that want to cross, progression in London would be an easy, swift and pleasant matter. Let me, then, suggest that the great road of imaginary London should be triple. Its two outer ways should be 30 feet lower than the central track, so that at the points where roads cross, the crossing being at the low level should pass under the central gangway. The simple result of this device would be that all travellers on wheels who were desirous of turning aside from the direction of the triple street would travel on the low roads right or left of the central track for the purpose of turning off when they arrived at their proper turning, whereas those who were intending to travel from one end of London to the other, including all such public conveyances as omnibuses and tramcars, would stay on the high-level road.

As it would be a great commercial waste of space to allow the footways of the central track to be shopless, I suggest that between the centre and the side roads there should be a range of buildings which would be only 15 feet or 18 feet high in their elevation towards the central road, but as much as 45 feet or 50 feet high towards the side roads. You will ask me why I ask for a triple road when a double road would possibly serve my rather extravagant purpose. I will explain.

Three roads would give more traffic accommodation than two, for one reason; for another, the mere fact that a person coming into the triple road from, let us say, the north would take the northern track and leave the southern track for those who came in from the south, would help to sort the traffic and thus minimise obstruction. Thirdly, there would be all the more shop frontage. Two miles of triple road—and I think you would want two miles of it—would give twelve miles of shop frontage, not four only as in our ordinary streets, and finally—this being my real reason—the triple street being well balanced would have the nobler effect from these points of view—such as rising ground—which would command a vista over the tops of the side shops.

Of course I should provide at fairly frequent intervals steps by which foot passengers could descend from the high street to the lower streets, and there would necessarily be certain places at which vehicles could drive down to the low level to suit the convenience of those who, having started on the long distance track, might change their mind and wish to turn aside from it: I spoke just now of my triple street—shall I call it the Threeway?—being two miles long. It might, I think, with some advantage have been about two and a half; this would enable it to cross all the main transverse roads. At its east extremity I should allow it to relapse—the side tracks should die off—and a somewhat widened centre should continue on the straight course till a mile further on it hits the Thames at right angles; there I would place a bridge on the Tower Bridge principle, unless, indeed, it were thought better to stop all tall shipping at the place where I have shown the docks, so as to have a fixed bridge at this point, which, you will observe, would link Poplar with the rest of London in a way quite unknown to our present civilisation. West of Westminster Bridge—if I may continue to call my imaginary bridge by that name—the road would travel level (though still triple), and divided by avenues of trees, to the round-point in front of the Royal palace, flanked on either side by embassies, Government offices and other public buildings of the national and imperial sort.

You will see that opposite the palace I have placed a large circle, into which several roads converge, and over which the Sovereign can look down the five-mile road that

unites the heart of Empire with the seat of traffic. This circle is an apparent contradiction of the principle of the plan, which has industriously avoided "the circus as possible." "Don't let traffic converge upon centres," that should be our motto, and I have almost ignored it here; but let me explain. A meeting-point in a West-end centre has not the same disadvantages as a meeting-point in the commercial or industrial part of the town; moreover, this circus is so placed as to have means of alternative roads almost any vehicle could use without loss of time and distance. But there is another means whereby the objections which might qualify circuses can be avoided in this and, indeed, in other cases. If our circuses, instead of being nothing more than swollen crossings, were really circuses—places of convergence—it is my belief that the difficulties which they present might be almost wholly avoided. My suggestion is that where several roads meet at a point, the point itself should be occupied by a plot of grass and trees, or by a small island, or even by a building, and that vehicles entering the circus, or circle, should go not across it, but round it, so that their circulating should be always unalterable in direction, that direction being the one in which the traffic of wine and other well-regulated institutions revolve. The circle is very small the congestion is so tight that the manoeuvres executed by the vehicles are not distinguishable from what happens in an ordinary circus of foot-paths, such as Oxford Circus; but if it be once increased to a sufficient size and the traffic be limited to circulating in one direction, then the process of crossing is reduced to a simple process of turning twice to the left.

[I have just heard, at the moment of writing this, that the suggestion here made has been put forward in print; the blow to my conceit is more than counterbalanced by the satisfaction of realising that there is some support for the idea.]

(To be concluded.)

## NATIONAL GALLERIES OF SCOTLAND

A REPORT on the collection of the National Gallery of Edinburgh, by Sir James Guthrie and the Hon. Mr. James L. Caw, has just been issued and is as follows:

In preparing the following report upon the National Gallery collection, and in making suggestions for its improvement, your committee has considered not only the chief blanks are, but the probabilities of being able to fill them.

The collection, having come together chiefly through the generosity of individuals and societies who have bequeathed or deposited works of art, has been gathered upon no definite plan, and there never having been until quite recently any annual Government grant for purchase, those responsible for its management have been unable to supplement it in any systematic way. The result is that, while the gallery contains many notable pictures or groups of pictures, the time value of the collection is marred by many blanks, specially amongst the old masters, which have not been filled at moderate prices is past. Had the National Gallery, like the Irish, been in receipt of an annual grant for purchase since its foundation this would not have been so.\* But an effort should be made to obtain the works of the chief artists unrepresented, and, the funds being obviously insufficient, your committee suggests that the members of the Board should do what they can to induce collectors to present pictures, promise bequeathments, or lend suitable works of art for considerable periods.

Considering that the generosity of Scottish collectors in the past has made the national collection what it is, your committee thinks that the Board might consider the advisability of issuing a circular setting out the chief blanks of the gallery and appealing for support from collectors of to-day.

Further, as a gallery may obtain importance from the possession of works of a particular kind or school, or from its general interest, it would be wise to strengthen the collection in the direction in which it is already strong.

Broadly considered, the collection consists of three sections—foreign pictures (chiefly old masters) and Scottish pictures, both old and recent. For the special purposes

\* While the National Gallery of Ireland had received in thirty-three years 34,000*l.* for the purchase of works of art, the National Gallery of Scotland in forty-five years had received only 6,000*l.* (Report of Departmental Committee, 1903, p. 10.)

port, however, it is better to take it as consisting of i.e. foreign, English and Scottish pictures. resources at the disposal of the trustees being i, your committee believes the ideal to be aimed at nection with the two former is that of collecting les of the more individual men, or characteristic i in each of the important schools rather than the t to form a large general collection illustrative of the of painting in all countries.

regards the Scottish section, on the other hand, an our might be made with hope of success to bring er a collection so fully representative as to present equate survey of Scottish painting in its historical pment. In this also, however, it would be well to quality before quantity, and to have an artist repre- by one or two highly characteristic works rather than arge number of less admirable examples.

hile oil-painting is illustrated by some of its finest ements, the art of water-colour is inadequately shown, our committee is of opinion that an effort should be to do justice to a form of art in which the artists of n country have been so conspicuous.

ulpture is hardly dealt with. The examples, exclud- me half-dozen pieces and the Torrie bronzes, are y busts by Scottish sculptors. This weakness might edied by the acquisition of a well-selected series of

ork in black and white—drawings, original etchings ngravings—is practically non-existent, and separate ough to be devoted to it, and to a collection of photo- s and coloured and other reproductions illustrating is of art of which the Board can scarcely hope to obtain al examples, and giving a comprehensive survey of ork of the greater figures in the history of art.

#### *The Italian Schools.*

ilian art is represented by fifty pictures, three models ne drawing, by thirty painters and one sculptor. Of pictures, twenty-four are Venetian, eight Bolognese, Milanese, three Florentine, three Tuscan, two Roman, eapolitan, one Genoese and one Ferrarese.

f the interesting early developments there are scarcely examples. The chief pictures are by Veronese, io, Tiepolo, Bonifazio and Guido Reni. The others, gh some are excellent, are of minor consequence. lanks are therefore too numerous to specify, and any y example would be a valuable acquisition. The s, however, of pictures by the more prominent masters eyond the Board's resources, and for most additions of rtance the Gallery must continue to be indebted to e donors.

#### *Dutch School.*

hirty-one painters are represented by forty-three pic- , most of which are of good quality. Rembrandt, Hals, idael and Hobbema, although not numerically strong, dmirably seen. In the seventeenth century, however, was widespread in Holland such a good standard of smanship that it is difficult to avoid omissions in men- g names. But probably the most desirable additions, nd further works by these masters, would be examples ssens, De Hoogh, Terborch, Vermeer and Nicolaes ; among the figure painters, and of Koninck and elle among the landscape painters. None of these s are represented. It would be well also to acquire a characteristic pieces by the still-life painters. What een said of the chances of acquiring fine examples of n art applies equally to this and to the other schools red to.

#### *Flemish School.*

Of the sixteen pictures by eight painters of this school, chief are the four Vandykes, the three Teniers, and raits by Jordaens and Suttermans. The great men of arlier school, the Van Eycks, Memling, Quentin Matsys, der Weyden and the rest, are unrepresented; and there othing, either landscape or figure, by Peter Breughel, ens or De Vos. Of all these masters examples are h to be desired.

#### *Spanish School.*

Five pictures and one piece of sculpture (by Cano) esent this school. A Zurbaran and a Ribera are the f pieces. Velasquez has a small sketch attributed to , but it is doubtful and wholly inadequate.

#### *German School.*

Since the National Gallery claimed the very interesting ures lent by it many years ago, German art has been

represented by nothing except a drawing by Overbeck and a portrait by Lenbach.

#### *French School.*

The small group (seventeen pictures by eleven painters) of French pictures is one of the notable features of the Gallery, and should be strengthened, if possible, by exam- ples of early portraiture, of the landscape of Claude and the Poussins, and of the work of Chardin and Fragonard among the painters of the eighteenth century.

#### *Recent French and Dutch Painters.*

The Romanticists and the Barbizon men, who were so early and so notably appreciated in Scotland, should also be represented, and with them might be associated the later Dutchmen. The chief of the former are Delacroix, Corot, Millet, Rousseau, Troyon, Monticelli, Michel, Daumier, Decamps, Diaz and Daubigny, and, although a later de- velopment, Courbet, Fantin Latour and Manet; of the latter, the brothers Maris, Bosboom, Mauve and Israels.

#### *English Painters.*

English painting is very inadequately shown. Forty-two painters (eleven by oil-pictures, the rest by water- colours) are represented by twenty-two oil-pictures and fifty-four water-colours. By Gainsborough, Wilson, Crome and Etty there are important works; by Hogarth, Morland, Cotman and Stark good, though small, ones. The two slight portraits by Reynolds are totally unrepresentative. The water-colours, with some exceptions (including the Vaughan Turners), are small and unimportant.

The most desirable additions would be pictures by Hogarth, Reynolds, Romney, Constable, Bonington and Turner; by Alfred Stevens and Watts; by F. Madox Brown, Millais, Rossetti and Burne-Jones; and by Mason, Walker, the Moores and Whistler. Of the water-colour painters, of whom good examples should be secured, Cox, De Wint and Cotman may be mentioned specially.

#### *Scottish Art.*

Fifty-three painters and eight sculptors are represented by about 100 oil-pictures, sixty water-colours and drawings and fifteen pieces of sculpture. The diploma works of the Royal Scottish Academy, being a distinct collection, are not included.

There is nothing by any of the following artists:— Jamesone, J. M. Wright, Scougall, Jacob More and Gavin Hamilton among the painters of the seventeenth and eighteenth centuries;\* and, among those of later date, the elder Fraser, Patrick Nasmyth, W. L. Leitch, Alexander Fraser, J. C. Wintour, Milne Donald, Docharty, Thomas Faed, John Pettie, Tom Graham, Colin Hunter, H. Macallum, George Wilson, Cecil Lawson, Hope M'Lachlan and G. Manson. All these men, although varying in importance, might be represented, and there are others whose inclusion would depend upon the quality of the particular work under consideration.

The following might be more fully represented:—Of the earlier men, W. G. Fergusson, Allan Ramsay and Alex. Runciman; of the later, A. Nasmyth, Wilkie, Roberts, Ewbank, Bough (particularly in water-colour), Dyce, Crawford, Harvey (in landscape), G. P. Chalmers, Fettes Douglas (in still-life and landscape) and E. Nicol.

To summarise:—The view of your committee is that the collection, as it exists, has notable features, the emphasising of which would materially increase its artistic importance, and that there are omissions in each department which detract from its interest alike from the artistic and the historical point of view.

## RESTORATION OF PETERBOROUGH CATHEDRAL.

AT last week's meeting of the cathedral restoration executive committee the following report for the year was read, adopted and ordered to be circulated:—

Your committee deeply regret the loss they have sus- tained by the death of Mr. G. F. Bodley, R.A., under whose advice and direction, since the death of the late Mr. Pearson in 1897, the work of the restoration of the cathedral has been carried out. In their annual report your committee stated that the works then remaining to be done to complete the restoration of the fabric, commenced in 1883, were the repair of the western faces of the north and south transepts. These works were finished in September last. It is therefore with

\* Although not a Scotsman, Medina worked in Edinburgh, and his portraiture possesses considerable historic interest.

the greatest satisfaction and thankfulness that your committee have to report that the last of the projected works for securing the stability of the fabric of the cathedral have now been executed. The expenditure upon the fabric has amounted to 53,614*l.* 8*s.* 10*d.*, and of this amount the sum of 57*l.* 10*s.* 10*d.* has still to be raised. In addition, the special gifts for adorning and beautifying the interior of the cathedral, including the choir floor and fittings, have, so far as can be ascertained, cost upwards of 20,000*l.* To the subscribers and to all who have in any way assisted in raising these large sums your committee now return their grateful thanks. All who know the cathedral will, however, be aware that there is still room for further effort, in order that the interior of the building may be put into a satisfactory condition. A rood-screen at the western entrance to the choir is desirable, and the flooring of the nave and other parts of the building requires attention. The payments during the past year were:—Repairs to the eastern face of the eastern aisle of the north transept and the clerestory above, 331*l.*; repairs to groining of this aisle, 42*l.*; repairs to the western face of the north transept, 265*l.*; repairs to the western face of the south transept, 252*l.*; glazing of clerestory and triforium windows of south transept, 18*l.*; architect's commission and travelling expenses, 46*l.* 18*s.*; other items, 3*l.* 2*s.* 6*d.*; hon. secretary for postage, &c., 12*s.* 6*d.*; total, 958*l.* 13*s.*

### THE EXPLORER OF KNOSSOS.

ON Saturday a portrait of Dr. Arthur J. Evans, Keeper of the Ashmolean Museum, by Sir W. B. Richmond, R.A., was presented to the University of Oxford on behalf of the subscribers.

The Vice-Chancellor (Dr. Warren), in the course of his address, said they all knew, and those in that room especially knew, what Dr. Evans had done for Oxford, for that institution, for the cause of classical study, and history, and exploration. They knew how largely the Ashmolean of to-day, its contents and its inspiring ideas, were his work, and if ever there was a man who as head of an institution deserved to have his portrait preserved within its walls and handed down to posterity as one who had placed upon it an enduring mark, it was the keeper of the Ashmolean of to-day. But Dr. Evans had a yet larger and wider claim and fame which needed neither portrait nor museum to perpetuate them. England, France and Germany had had many great excavators and explorers of the past. With these, with the names like those of Champollion, of Layard, and of Schliemann, to cite no others, the name of Dr. Evans would ever be remembered. It was not too much to say that by his discoveries—the result, let them remember, of no mere happy accident, but of natural flair and genius, long and patiently cultivated, united to study in the library and intrepidity in travel and adventure—he had revolutionised their knowledge and their ideas of the classical past. Dr. Evans had made Homer, he would not say a living author, for that he always was, but a more living author still, and a modern author. He was not sure that Agamemnon and Achilles were not now more historic figures, and brought nearer to them, if not than Charlemagne and Roland, at least than Arthur and Lancelot. What he was sure of was that the marvellous people on whom all the other history of Europe hinged, what they called the Greek race, had been lifted suddenly into an entirely new position by the great discoveries of Crete and Knossos. What seemed the legend and fairy tale of their youth, the labyrinth, Dædalus and Minos, and many another name and figure had acquired an entirely new significance. Dr. Evans was still comparatively a young man, full of fire and energy. They hoped he might carry his researches still further and to yet more complete success. Their best tribute to him, he was sure, was to aid him to carry on his work, to make it known, to enlist sympathy, to give what they could and to get others to give to assist him. It was his privilege to accept this portrait, so worthy in itself, so happily conceived and realised, and to assure Dr. Evans that the university and the museum would prize and preserve it as one of their most signal treasures and illustrative possessions.

Dr. Evans, in reply, according to the *Manchester Guardian*, acknowledged how much he had been assisted by friendly co-operation. He had in the spirit of the old regulations, he said, tried to combine temporary and sometimes rather prolonged absences with some direct contributions to the museum. They had in that way put together a Cretan section which at any rate had this to recommend it, that

there was no other series of antiquities illustrating the civilisation to be seen anywhere else, at least not to an extent, except perhaps in Venice or in the British Museum had grown, and that was to a great extent to the provision which enabled the keeper to travel and keep in touch with foreign discoveries. He was referring to Cretan antiquities, but also to their collection of Greek vases. That had been largely due to his being able to travel and to excavate in Sicily. In other words, the office had, perhaps he might say, a diplomatic character. They had had to enlist, and many had contributed to the sympathies of those who excavated in Egypt, the result of the co-operation of explorers like Professor Petrie and others had been that they had more than a museum in this country been the depository of the discoveries which had brought back within the reach of history what in Egypt had been regarded as the realm of myth. This museum, owing to the munificence of the Exploration Fund and other societies interested in Egyptian excavation, and especially Professor Petrie, had become a depository of a collection of early Egyptian relics, in the prehistoric period and the early dynasties, which not to be matched outside Cairo. He hoped, thank the munificence of the present Reader in Egyptology, that that foundation was going to be solidly built up, and that the department of Egyptology was going to be a permanent endowment. What they all felt was that they must be prepared to produce new divisions. The new subjects starting up which all required to be provided for. He acknowledged the munificence of their great benefactor, Mr. Fortnum, who had enriched almost every department of the museum, the Egyptian, the Classical, beyond everything else the admirable department of the Renaissance art, and he expressed the hope that what thus been achieved might be the stepping-stone to a greater development, and that the whole of their fine department might be placed upon a new and permanent basis, in which the Renaissance objects of all kinds might be grouped together with the pictures in a thoroughly scientific manner.

### WIND PRESSURE.

AT the ordinary meeting of the Institution of Mechanical Engineers on the 3rd inst., the paper read "Experiments on Wind Pressure," by T. E. Stanton, M.Inst.C.E.

The experiments described in this paper form the first part of the research on the distribution and intensity of the pressure of the wind on structures, which was proposed to the committee of the National Physical Laboratory for the first investigation to be undertaken in the engineering department, and was commenced by the author in 1902.

The first part of this research, of which the results have been communicated to the Institution in December 1903, is the investigation of the resultant pressure and distribution of pressure on flat plates normal to and inclined to the direction of a uniform current of air.

As those experiments were made in a channel 24 inches in diameter, the dimensions of the plates were necessarily small, but between the range in dimensions obtained, the results indicated that the resistance of geometrical plates was proportional to the area of the plates. In the case of dissimilar plates, however, such as square plates and long rectangles, the resistances per unit area differed considerably.

The value of the resistance so found in these experiments on small plates was somewhat smaller than determined by Dines, Frowde and Langley for plates of order of 1 square foot in area. For comparison, the value of the constant  $K$ , in the pressure velocity relation,

$$P = K V^2$$

are given in the following table:—

Experimenter.	Method.	Value of $K$ .
Dines . . .	Whirling Table . . .	.0029
Frowde . . .	Moving Carriage . . .	.0037
Langley . . .	Whirling Table . . .	.0033
Author . . .	Plate in uniform current . . .	.0027

On the completion of this part of the work, it was decided to make observations on flat surfaces of area ranging up to 100 square feet when exposed to the wind, since general experience tended to show that in actual winds whose velocity was not uniform over time or space the mean pressure per square foot on a large surface

erably less than that on a small one. As a knowledge variation in resistance with the dimensions of the re, if it exists, is all important in design, the investi- of this problem was made the chief feature of the experiments.

the purpose of the work a steel windmill tower was in the grounds of the National Physical Laboratory (dington. The experimental boards and models of res were attached to a light framework carried by o of the tower, the height of the centre of the boards he ground being 50 feet.

er some preliminary experiments, the method of ation finally adopted was the determination of the nt in the pressure-velocity relation for pressure-boards ying dimensions and for the models of structures. found, as anticipated from a knowledge of the e character of the velocity of the wind, that single ations were quite worthless for the purpose in view, at, if for any pressure-board or model about 200 ations of the velocity of the wind and the corres- g pressure on the board were taken, it was possible in a fairly accurate value of the constant. In these ations the velocity of the wind was estimated from of pressure-tubes, similar to those used by Mr. Dines nemoneter, placed about 15 feet above the centre of the

These tubes were connected by lead pipes to a ve water-gauge, of the type used in the author's us experiments, placed at the foot of the tower. The nt pressure of the wind on the board was estimated a measurement of the pressure produced in a closed er of air by the deformation of a thin steel diaphragm g its cover, which was in contact with the centre of ressure-board. This pressure was also transmitted h lead pipes to the foot of the tower, and there red by a similar tilting gauge to the one used for the y estimations. The simultaneous observations of re and velocity were only possible in the short s of time in which the velocity of the wind was fairly nt. Such periods, lasting from 2 to 5 seconds, were to occur about once a minute in a fairly steady

e. The results of these observations on three pressure- s, one 5 feet by 5 feet, one 5 feet by 10 feet and one t by 10 feet, gave practically identical values of the nt in the pressure-velocity relation. In units of s per square foot and miles per hour the mean value s constant for the three boards was .0032. As this agreed so well with the average of those obtained by ous experimenters when using plates of the order of are foot in area, it was not considered necessary to e experiments on plates smaller than the one 5 feet by in the present case.

urther observations on the intensity of the pressure at ont and back of the boards appeared to show that the of the higher value of the constant, compared with btained in the case of the small plates in the 24-inch imental channel, was the relatively greater intensity e negative pressure at the back of the boards compared t at the back of the small plates.

periments were also made on a model of a braced r 29 feet long by 3 feet 7 inches deep, and on a roof l whose sides were 8 feet by 7 feet. The ratio of the ance per unit of area of the model girder to that of a re board in the wind was found to be precisely the as the ratio of the resistance per unit of area of a model of the girder made to a linear scale of 1 in 42 square plate in the previous experiments.

he resultant pressures on the roof were obtained, for windward and leeward sides, at angles of 30, 45 and gs. inclination to the horizontal, and indicated the con- able suction effects on the leeward side of a roof when ressure inside the building is augmented from the ward side by open doors or windows.

hese results lead to the conclusion that the resistance complicated structure in the wind can be accurately icted from a determination of the resistance of a small el of the structure in an experimental channel.

at a Recent Meeting of the Berwick Town Council a rt was submitted showing that some of the stonework he spire of the ancient town hall is scaling off and ying in places. It was agreed that the work of repair, r the direction of Mr. Stevenson, architect, should be ed out at the earliest suitable date.

## ARTISTIC EXPRESSION OF STEEL AND CONCRETE.\*

THE artistic use of steel and reinforced concrete is con- sidered a new problem in architectural design.

Wherever a combination of materials which is some- what new in character becomes usual by the number of its examples there appears a desire to analyse its com- ponent parts, to make its architectural expression charac- teristic, to enrol it under architecture raisonné, and naturally to exaggerate its peculiarities in the process. The intention is excellent and admits of no contrary argu- ment. What can be more undeniable than that architecture should express structure, and that unusual structure should demand unusual architecture? If any contention is at all possible, it can be merely in relation to the degree in which this construction is unusual, and, as a corollary, as to how unusual the architecture must be to express it. Is re- inforced concrete new in the elemental factors of structure, and to what extent? Its main factors are vertical supports and horizontal loads (in which it resembles Greek structure), both of which are reduced in cross sections to areas less than in any other construction. It has no structural arch, though it has curved trusses or beams (in which it does not resemble Roman structure). It has continuous vertical factors with the horizontal factors inserted between (in which it re- sembles much of Gothic architecture), and it has horizontal planes in its floors which appear on the façade, in which it is in no way unusual. What are the differences, apart from the areas of its cross sections, between it and other structures?

### Main Features of Structure.

First, it is made up, as far as its vertical factors are conceived, of slender piers; second, as far as its horizontal factors are concerned, by beams of great possible span; and both piers and beams are each homogeneous, not built up of separate blocks, as in stone or brickwork, and therefore corbels are inconsistent. A reinforced concrete structure is, therefore, a pier and beam structure of slender supports and long spans, its intercolumniation being much greater than in any previous type of building, and from our con- stant association with shorter spans the beams seem weak.

### Treatment of Main Structural Factors.

The openings between the piers are unusually large, the whole structure appearing to be slight and undeveloped. Up to this point the choice of treatment seems to be merely as to whether the continuous vertical supports shall be pronounced, or the successive plans of the floors. The decision as to which of the two methods of expression shall be adopted depends entirely upon the location of the building, and upon the proportion of its height to its width. Isolated buildings of great height may well be treated with long vertical lines; but in the majority of cases the build- ing requires a horizontal treatment, as it is associated with other buildings in the same block, and its assertion of vertical lines is overwhelmed by the length of the base line of the block. Also the vertical lines are ineffective in shadow, as they can have but slight projection, and as they are merely surface indications of interior structure and are not buttresses. Horizontal lines on the contrary always produce shadows. In most cases, therefore, the treatment of reinforced concrete buildings by horizontal lines announcing their floors (the distances of which apart are of much more nearly fixed dimensions than are the inter- columniation of piers or the height of verticals) is better in relative proportion to adjacent buildings, and affords stronger evidence of purpose than does the exaggeration of the verticals.

### Treatment of Lintels.

The apparent weakness of the long lintels has been mentioned. This can be modified in several ways, either by crowning the centre, which is of little value in long spans and is inconsistent with the concealed structure, or by arching the lower line of the lintel, or by bracketing at the piers. The cornice is capable of any treatment which does not suggest stone corbels or modillions. The next problem is that of the necessary filling treatment of spaces between factors of main structure of the openings between the piers and the successive floors. This is manifestly a screen only, whether of plain surface or of fenestration. It supports nothing. Its structural requirements are merely those of frames to openings and of surfaces between the openings. As its structure is unimportant and can be done in many

\* A paper by C. Howard Walker, read at the Convention of the American Institute of Architects in Chicago.

ways, there is no more reason that it should be announced than that the palm of a man's hand should announce the bones beneath. The anatomical structure of the building is adequately recognised when the piers and lintels are acknowledged; in fact, it is not necessary even in architecture *raisonné* to even announce them, provided they are not contradicted.

The suggestions for this secondary treatment of curtain walls between main structural factors may either be derived from minor structure or may be surface ornament only.

#### How Architects get Work.

SIR,—I want to be an angel, consequently I have avoided rushing into the controversy so amusingly sustained in your columns during the past few weeks. May I be permitted to suggest an amicable settlement of the dispute by the following pronouncement? Discarding all consideration of the superfluous correspondence, and restricting our attention to the letters writ from Alexandria and Abercumbeli, I think all your readers will agree that the palm of victory shall be awarded to Mr. Robert Williams.—Faithfully yours,

PERCY L. MARKS.

SIR,—As the writing of one letter is apt to suggest somewhat tyrannically the necessity of continuation, I will (with your courteous permission) send you a few further lines before finally leaving the subject. It is in order to correct a misapprehension under which your correspondent, "A Bachelor," is labouring.

It is a mistake for architects to suppose that your worthy magazine is read only by members of their profession, and, for my part, I have yet to learn of any member of that profession indulging in a bath.

A friend of mine once (nay, on several occasions) said to me, "Of all ungodly-looking people commend me to architects," and to judge by the way he gathered his toga about him whenever an architect approached, he evidently considered them as unattached to the Order of the Bath. Pardon the garrulity of four score and nine.—Your obedient servant,

THE PANTALON AS BEFORE.

December 8, 1907.

#### GENERAL.

**Mr. Thomas Forster Brown**, aged 72, of Stoke Bishop, Bristol, and of Richmond, Yorkshire, head of the firm of Forster Brown & Rees, civil and mining engineers, of Guildhall Chambers, St. Mary Street, Cardiff, a Fellow of the Geological Society, of the Royal Historical Society and of the Surveyors' Institute, left property valued at 132,253*l*.

**The Parish Church** of Honeychurch, Devonshire, is to be closed owing to its dilapidated condition and the inability to get anyone to accept the living, which is only valued at 80*l*., including seventy-eight acres of glebe. The church seats sixty persons.

**The Borough Surveyor** of Workington has been instructed to report upon the question of the provision of and the cost of a machine for the manufacture of the tar macadam with which the principal streets in the town are now laid.

**A Room** in the Baillie Gallery, Baker Street, where an exhibition is open, is arranged with objects designed by Mr. C. F. A. Voysey, architect.

**The Truro Cathedral Building Committee** last week approved Mr. F. L. Pearson's design for the western towers and spires, and had under consideration plans for the chapter-house and for a cathedral school within the precincts. Arrangements were made for a peal of bells. A letter was received from Mrs. J. E. Hawkins, London, who has given 20,000*l*. for the erection of the towers, expressing the hope that a peal of bells would be provided by the time the towers were finished, and adding:—"It will be a great joy to me to give the largest bell of all, and I am sure that the great and representative Cornish families will each like to give a bell. Ten would soon be forthcoming. If this could be accomplished, and if the smallest of all could be collected for by children of Cornwall and called the children's bell, it would be really delightful."

**The Liverpool City Council** by forty-seven votes, have approved a recommendation of the committee to purchase from the Dock Board a piece at the east side of the new dock offices, for the purpose of public baths. It was announced that terms had been agreed with the Dock Board which were considered satisfactory, that there was every prospect of arrangements being concluded whereby the Custom House would be transferred to the central site of the Pierhead.

**An Interesting Discovery** has been made in connection with the burgh seal of Annan, N.B. The seal, which is of an ancient date, bears four letters which antiquaries and others have for many years deciphered as P.I.W.M., it is not known what these letters mean. At a meeting of the Annan Town Council a Dumfries solicitor, in appearing before the Council in a matter concerning some feu-duties, produced an impression of the burgh seal of 1610, on which the letters P.T.W.M. were quite clearly visible. At present the burgh coat of arms with the letters P.I.W.M. is on the stained windows of the town hall and in other places.

**From the Annual Report** of the Commissioners of Majesty's Woods, Forests and Land Revenues it appears that during 1906-7 important work was executed at the south transept of Tintern Abbey. In the north transept (eastern end) the tops of the walls, which were in bad condition, were cleared. The stonework and the old tracery there were reset and made sound. Similar operations were carried out in connection with the walls of the south aisle. Some preservation work was done on the mullions and parts of the window tracery in the refectory, while various minor repairs were also undertaken.

**At the Last Meeting** of the King's Norton and North District Council it was proposed that the education committee be authorised to invite architects practising in Birmingham, or within a distance of six miles of Birmingham, to submit competitive designs and plans for a proposed new department for infants and for co-educational laundry and woodwork rooms at the Cotteridge School. An amendment was proposed by Mr. Whittaker to restrict the competition to a number of Birmingham architects. It was eventually agreed to limit the competition to six architects resident or practising in the district, to be selected by the committee, who were instructed to appoint an assessor in the competition.

**A Meeting** of those interested in the formation of a society for the purpose of ingathering and preserving some permanent form the lore of old Edinburgh, its traditions, folk and buildings, was recently held in John Knox House. Mr. W. J. Hay, the chairman, said he believed that a society was wanted to preserve material in regard to Edinburgh in pre-railway days and to secure information on the changes effected since that time. Buildings disappeared and traditions were vanishing, and it was desirable that every effort should be made to record what was still available, especially from old inhabitants. A provisional committee was thereafter appointed to draw up a constitution and rules, with Mr. Hay as convener. The committee will meet at an early date to consider the proposed constitution, and what further steps may be necessary for the promotion of the Society.

**The A.A. Musical Society** will produce at the Glasgow at the end of February their second musical play, entitled "Metope Mania," written by the Purple Patch. The play will be Wednesday, Thursday and Friday, February 27 and 28. A portion of the proceeds will again be devoted to the Architects' Benevolent Society. Tickets will be obtainable from the hon. secretaries, A.A. Musical Society, 18 Tufton Street, S.W.

**The Brechin Town Council** have been informed that a special finance committee had under consideration the claim by the trustees of the late Mr. Mackison, Dundee, for a share done in connection with the proposed erection of the new slaughter-house at Strachan Park a number of years ago. The committee had resolved to recommend the Council to refuse to admit the claim. The report was unanimously approved.

**Part of the Ancient** north wall which once surrounded Chichester fell on Saturday owing to the effect of recent heavy rains. The wall itself is about 12 feet wide, but the stone facings are only about two feet thick, the middle being composed chiefly of earth. The portion which bulged out eventually fell down on the roadway with a crash—probably nearly twenty tons of stone and earth altogether were displaced.

# The Architect.

## THE WEEK.

AM THOMSON, Lord KELVIN, who died on a night in his eighty-fourth year, gained his reputation mainly through his applications of electricity, especially to submarine telegraphy. But there were many branches of physical science which he did not neglect. The number of papers which he contributed to the Transactions of various societies is evidence of his omniscience. Belfast can claim the honour of being his birthplace, his father at the time being a teacher of mathematics at the Academical Institution. He was so precocious that when he was little more than years of age he was able to enter the University of Glasgow, where his father had been appointed Professor of Mathematics. In his twenty-second year AM THOMSON was elected Professor of Natural Philosophy in the University. In a speech he delivered he related the difficulties which attended the introduction of electric lighting in his own house. The current was derived by the aid of a dynamo gas-engine. The instructions he gave were, "through the whole house. Wherever there is a burner put in an electric light. There were gas-burners and there were 106 electric lights in the house about the end of the year 1881. He had heard that any house was wholly lighted by electric light at that time. There might have been a house in America. There was none in this island. It was the beginning. It was quickly followed by a large spreading out of the electric light. But the University of Glasgow might look upon it with some regret that a house in the University had its whole lighting done in the way explained. A little after midnight he used to go across to his laboratory to stop the gas-engine, and anyone who wanted a light in the house must have a candle, because the gas had been cut off and soldered up." Lord KELVIN's life may appear to many to be very simple, but it was the result of numerous experiments and important principles. The celebration of the centenary of his professorship in 1896 was unexampled, as if all the representatives of science throughout the world testified to his distinction. Of course he suffered from illness. But for a man who had a laborious life of eighty-four years could be considered as of long duration.

It suggests the extent of the vacant building sites owned by the London County Council when it is found that an application has been made for permission to use some of the surplus land to give work to the unemployed. Mr. JOSEPH FELS, who was connected with a scheme at Hollesley Bay, Essex, the applicant, obtained that permission would only be desired so long as the sites remain undisposed of, and that possession would be given on demand. An association, it appears, has been formed for the purpose of organising the work of cultivation by the unemployed of unused plots of land. It has been successfully carried on in Philadelphia, New York, Cleveland, Detroit and other cities, and covers nearly 300 acres, belonging to public as well as private owners, were cultivated in Philadelphia. The improvements committee are advised that, although it would be undesirable that Mr. FELS should be permitted to use the Council's valuable land in the central parts of London, there would be no objection to allowing him to use less valuable sites. It would, it is to the public interest to allow him to do so, as his operations would not interfere with the letting of land, and would relieve the Council of certain expenses in levelling, watching and fencing. It is therefore recommended that, provided Mr. JOSEPH FELS agrees to give immediate possession, as and when

required by the Council, and agrees to make no claim for compensation in respect of the determination by the Council of any or all of his tenancies, he be allowed to use for the purpose of providing work for the unemployed portions of the Council's surplus land at the following places:—Aylesbury Place, Clerkenwell; Falcon Court, Southwark; Tower Bridge Road; Tower Bridge northern approach; High Street, Fulham; Marius Road, Balham; Tooting High Street; Garratt Lane, Wandsworth; Webber Row, Southwark; Long Lane, Southwark; Wandsworth Common, north side, and Balaam Street, Plaistow. Vacant land in a town is rarely pleasing to look on; but it remains to be seen whether Mr. FELS's experiments will afford a better view and whether the sites can be cultivated without loss.

PROMINENT metropolitan auctioneers are careful when selling paintings and drawings which are attributed to great masters to suggest in some way whether there is certainty about the authorship or whether the buying is to be considered as a speculation. But a great many catalogues appear which astonish collectors from the courage which is shown in crediting able artists with works which have not their characteristics. A judgment delivered by Mr. Justice PICKFORD in an action which was tried in Manchester is suggestive of the risks incurred in cases where the authorship is suggested to be doubtful. Mr. HINDLE, the plaintiff, claimed 138*l.* 11*s.* 6*d.*, the amount of a cheque of which payment had been stopped. He received some pictures for sale, and in his catalogue they were described as the property of a gentleman going abroad, and the pictures were said to be choice examples by or attributed to various artists. The defendant purchased twenty-five of them for which he paid by cheque 138*l.* 11*s.* 6*d.* The cheque was not cashed for some days, although the auctioneer paid the owner of the pictures. When the cheque was presented it was found to be stopped and the pictures were returned. It was alleged that the artists named did not paint them, and that the auctioneer was aware they were not genuine. The jury found that the defendant was induced to buy partly through the false representations. Judgment was deferred. His Lordship held that the plaintiff was justified in suing in his own name and not as agent for the owner. The representations were innocently made, and in such a case a contract could be rescinded if the parties could be replaced in their original positions. But that was not possible, for the auctioneer had paid away the money, and it was doubtful if he could recover it. Judgment was therefore given for the plaintiff. The case is a curious one, but has a warning for all concerned in the disposal of works of art.

A COMMERCIAL library established by the Board of Trade and intended to be used for business purposes should be in a modern building properly lighted, heated and ventilated. We doubt the expediency of sacrificing what might be an admirable institution for the sake of preserving an old building in which every reader will have to suffer more or less inconvenience. No man can serve two masters, and buildings cannot be treasured for their antiquity and at the same time made to serve purposes for which they were not designed. If the City, the County Council and the Government would co-operate Crosby Hall could easily be preserved as an example of ancient architecture. But architecture for its own sake has little value in London, and in consequence Crosby Hall is to be used for housing a commercial library and a rent is to be paid for it by the Board of Trade. The library is to be combined with sample rooms, and in course of time other uses will be discovered. Can anyone imagine that the hall will not be deprived of its ancient character when it is made to pay for its existence, or that readers and inspectors of samples will be at their ease in such premises?

## METROPOLITAN WATER SUPPLY.

PRIOR to 1619 the water supplied to London would horrify the humblest of the inhabitants at the present time. The monk FITZ-STEPHEN, who was acquainted with fouler water on the Continent, testified to the sweet, wholesome and clear wells which were to be found in the suburbs. The importance of such sources is suggested by the names of districts of which the word "well" forms a part. Well water in our time is regarded with suspicion. But in less scientific days when analysis was unknown water was supposed to spring from some subterranean source and to be as free from impurities as if it had been distilled. There are, however, occasional references which are enough to suggest that both the wells and the conduits of fresh water were recognised as not entirely satisfactory. Benevolent people endeavoured from time to time to overcome the danger by introducing substitutes for decayed pipes; but they could be only partial remedies. Not until the third year of the reign of JAMES I., when the Act was passed for the making of "a new trench to convey the water from Cadwel and Anwell," and in the following year, when power was given to "the Mayor and Commonality of London to convey the said water in a trunk or vault," was there a prospect of a regular supply. In course of time MYDDELTON's New River was supplemented by other sources and the water companies became monopolies.

On the whole, it must be allowed that the water companies, although confined to sources within limited districts, endeavoured to supply as pure water as could be obtained by elaborate processes of filtration. But when about the middle of the nineteenth century sanitation received more earnest attention than in any previous age, dissatisfaction with the companies was created. It was necessary to be careful about restricted supplies; but that was interpreted as mere penuriousness. If any sudden outbreak of an epidemic arose in which water would have to be liberally used for sanitary purposes, it was concluded that the companies would not be equal to the emergency. Accordingly the Board of Health was directed to report on the subject. In 1850 it was suggested by the officers that the sandy district in Surrey known as the Bagshot Sands should be turned to account. So little was known about the site, it was contemplated to depend on the surface water of the sands and heath alone. The existence of several abundant springs was overlooked. But when they were gauged one of those reactions which are not uncommon in connection with projects of water supply took place, and it was proposed to neglect the surface water, which was more or less peaty, and to depend on the springs alone.

The area of the Metropolis increased, and demands for a larger supply could not be suppressed. It became more evident that there was a risk in depending on the supplies to be found within a convenient distance of London. Accordingly, when the Royal Commission on Water Supply was appointed about forty years ago, several schemes of novel magnitude were proposed. Among them was one for deriving water from a Welsh source, and another which would utilise one or more of the northern lakes. People had become so accustomed to believe in the possibility of finding water close to London, the western and northern sources appeared at first so remote as to become impracticable, although devised by engineers who were well acquainted with the subject. Objections were raised about the expense, the terrible consequences which might arise if the supply of the Metropolis were cut off by invaders or by a mob of discontented people, or by any terrestrial movement which would fracture the large pipes. The water companies were at the time influential in Parliament, and revolutionary schemes had no chance. The result was that London, after all the inquiry, remained as before.

Towns in the provinces alone became gainers from the evidence. The value of Wales and the Westmor-

land and Cumberland districts was revealed, and that which were supposed to prevent the utilisation of supplies by the Metropolis could not be said to be places which were less distant. Manchester, Liverpool and Birmingham by timely action secured for themselves the sources which London might have acquired. The Metropolitan Board of Works had been more courageous.

An attempt was next made to overcome the difficulty which continued to be magnified, by obtaining possession of the properties of the water companies. A Commission was appointed to investigate the question of control which was anticipated, no doubt, that something would be done by the Government to aid London in accomplishing everything by a moderate outlay. But no Government could set aside the rights of owners. Large sums were, of course, sought, but the authorities again hesitated, and subsequently it became necessary to offer still larger sums before the companies surrendered their waterworks.

There will always be a difference of opinion as to the wisdom of the act. According to some the purchase was inadequate, and could never be made to correspond with the growth of the Metropolis. A new system should have been secured, new works constructed, new appliances introduced. In that case the water companies would have to be paid little, if any, compensation. On the other hand, the number of hours of London which would have to be disorganised was itself sufficient to make authorities alarmed at the remedy. The simplest course was therefore adopted.

But the great difficulty remained. The water supply was as deficient under the new owners as it was under the companies. Sanguine people continued to believe that justice was never done to the sources which were available. Through that belief arose the creation of the Water Trust. The new controllers possessed the courage to acknowledge the gravity of the situation which they have to cope. That must have a beneficial effect, for it is like taking the public of London into confidence. Hitherto it was difficult to realise from the pronouncements of the chairmen of water companies that there was any cause for anxiety about the future. Investigations of the Water Board have demonstrated that fifty-four years from the present time, or in the needs of London will have grown to such an extent that a supplemental gathering-ground must be found, year have been acquired and turned to account. It is not to be supposed the present sources of supply will be sufficient for the next half-century. It was necessary to derive a still larger supply from the Thames.

Those who desire an improved water supply are dissatisfied with the proposal to make the Thames more productive. Sir MELVILLE BEACHCROFT, the chairman, considers that Thames water is quite as potent as Welsh water, and, of course, his influence must carry great weight among members of the Trust. But it is doubtful whether a body of independent engineers and chemists would support his theory. The late Sir BATEMAN long ago proposed to derive the water of London from Wales. At a later period Sir ANDER BINNIE, who was possessed of an intimate acquaintance with the requirements of the Metropolitan Board, also relied on Wales as the most eligible source. The success of the water supply in Liverpool and Birmingham confirms the judgment of the two metropolitan engineers. The case, we must admit, is not so simple as it was some years ago. London has now a large Stock which is supposed to be no less safe than Consols or any other public security. To do anything which would affect the value of such an investment would, of course, require serious consideration. In fact, the delay in grappling with the difficulty, could have been overcome thirty years ago, had it been allowed to become so complicated that probably no sacrifices cannot be avoided.

There is another phase of the subject which is not so easy to determine. It has been repeatedly pointed

journal that the practice of allowing the first who can pass a private Bill to appropriate any ground or catchment basin is most dangerous. It would have been simple when the subject of water was being considered on national grounds to have prepared a map of England on which the districts could be marked to which provincial towns could make claims. The boundaries, of course, would be subject to variation. But they would at least suggest where sources of supply were to be sought, and would help to prevent towns endeavouring to monopolise a much more valuable resource than is requisite for present or future requirements. Through the delay London is likely to suffer for if the present practice of dealing with the claims of each town when it comes before a Parliamentary committee is continued, where is London to look for the water supply which will be indispensable in the future or it may be at a much earlier time? The *laissez-faire* principle may have its advantages, but it will not meet the emergency which will then arise. The Government can prepare for the future, and it is desirable that no delay will be suffered before completing the necessary arrangements.

#### LETTERS OF ITALIAN ARTISTS.

THE name of GIOVANNI BOTTARI is seldom met with in print in our time. But so long as antiquity is valued in art and in literature receives respect from mankind his name should be remembered. He was Florentine, and he was born in 1689. He was a priest and a doctor of theology. His knowledge of his native language was so extensive that he was entrusted by the Accademia della Crusca with the editing of the great Italian dictionary. In the early part of the eighteenth century monarchs were proud to bring classical works, and BOTTARI had charge of those from the Grand Ducal printing office. He was sent to Rome and appointed professor of ecclesiastical history. There was so much confidence in his knowledge that he was deputed to report on the possibility of diverting the Tiber for navigation. More congenial to him were his investigations of the catacombs and other subterranean cemeteries of Rome. In course of time he brought out volumes on the Capitoline Museum, the Vatican, and an edition of VIRGIL which was long valued.

BOTTARI used his influence in order to prepare one volume of work, which but for his exertions might never have existed. This was a collection of the letters of Italian architects, painters and sculptors, as well as of some foreign artists who had studied in Italy. He completed the compilation in 1754, and he was fortunate in being able to issue no less than seven volumes. He was so eager to possess genuine examples of the correspondence, he was not critical about the subjects of the letters or the rank of the writer. Many epistles are therefore of little interest to posterity, and it would be difficult to identify works by several of the writers. As a rule an Italian artist did not care much about expressing his thoughts by words. His private opinions are often to be inferred from the character of his work, and the famous figures by MICHEL ANGELO for the family of the MEDICI. Besides, in an age when despotism was general and justice was elastic, it might cause inconvenience to an artist if he prepared documents which, though simply expressed, could be interpreted as having a serious meaning. But, making every deduction, BOTTARI's collection has often historical or biographical importance, and enables us to understand important events in connection with Renaissance

as a fellow Florentine, BOTTARI must have felt pride in the greatness of MICHEL ANGELO. The faithful VASARI, however, anticipated him, for the majority of the letters from the great master were either printed in full or in abstract in the biography. But there are some others.

In one we learn that VASARI's intention of writing the lives of the artists was well known to his great patron. VASARI had written some kindly and flattering letters, and MICHEL ANGELO declares that he has been overestimated. But he adds that his dear GIORGIO's talents did not astonish him, because he was aware how, by his writings, VASARI could give life to dead men, could extend the lives of old men, or, if he pleased to be angry, could make men wish to be dead. BOTTARI was not equally successful in recovering epistles from LEONARDO DA VINCI, and the absence somehow suggests his remoteness from ordinary life, although he appears to be a sharer in it. The interesting letter dated June 1, 1519, from FRANCISCO MELZI, a pupil, to the artist's brothers, is the principal evidence concerning the death of the master. He states that DA VINCI died on May 2 and accepted the last rites of his Church. As a foreigner LEONARDO could not by the strange laws of that time make a will disposing of any property which he possessed in France. FRANCIS I. made a concession in favour of the artist. His 400 crowns and the little property he possessed at Fiesole were to be divided in equal portions among his brothers. The will is now well known. After resting three entire days in the chamber where he died and where the prayers of the Church were to be offered, LEONARDO desired to be buried in the church of St. Florentin, Amboise. All his books and the appliances of his art were bequeathed to FRANCISCO MELZI, and his two domestics were to share in the garden he possessed beyond the walls of Milan.

It has often been supposed that the Renaissance artists were extremely jealous of one another. But we find MICHEL ANGELO praising BRAMANTE; and architects apparently were very glad to lend their designs to some of their contemporaries. It is curious, however, to find MICHEL ANGELO, in criticising the design of SANGALLO for St. Peter's, suggesting that parts were so badly lighted they would serve to conceal members of the criminal class, thieves and forgers, and that at least five-and-twenty men would be required to search the building after the doors were closed in order to make sure that malefactors were not concealed somewhere. In another epistle we find SANSONO imploring the protection of Cardinal BEMBO after the accident at the Libreria at Venice. He says it arose from the ignorance of the overseers or foremen, who removed the scaffolding before it was entirely completed. The architect was imprisoned and fined, but subsequently was reinstated.

One of the most admired paintings in the National Gallery is TITIAN's *Venus and Adonis*, which was formerly in the Colonna Palace in Rome. It must have pleased the artist, for he made several repetitions. In one of the letters TITIAN writes to PHILIP OF SPAIN expressing his gratitude for gifts received, and, in order to make it more evident, he had resolved to put all his power into a painting of *Venus and Adonis*, which should serve as a pendant to *The Danae* in the palace. In another letter TITIAN proposes to paint *Perseus and Andromeda* and *Medea and Jason*. He also rejoices that Heaven has added England to PHILIP's dominions. A letter from ANIBALE CARO, the poet, to the Duke of PARMA reveals to us that in the sixteenth century, in Italy, a young and clever architect was not always sure of commissions. CARO gives a letter of recommendation to PACIOTTO, who was a relation of RAPHAEL's, but who was very small and very timid. Persons of distinction in Rome urged CARO to use all his interest with the Duke in order to obtain employment for PACIOTTO, who was honest, inventive, industrious, modest, and those who were competent to judge considered him as having exceptional talents and training and that he possessed not only a perfect knowledge of VITRUVIUS, but also of mathematics. How far the architect succeeded remains untold.

It is always doubtful whether any statement by BENVENUTO CELLINI is to be taken as fact or fiction. In one letter he begs to be paid for his bronze statue of

*Perseus*, on which he said he was engaged during nine years. He professes that he would be satisfied with whatever sum the Grand Duke gave him if he expressed his satisfaction with the statue. But he would not produce a similar work for any other prince for less than fifteen thousand golden ducats. He would, however, be willing to accept five thousand ducats from the Grand Duke, and land to the value of five thousand. He humbly begged for a prompt decision, as the uncertainty of his position was killing him. If he liked he might have obtained heaps of gold from the barbarians—France; but he preferred a single crown from the Grand Duke, in whose service he hoped to live, to one hundred from another prince.

A curious chapter in the history of Italian painting would be furnished from the treatment which artists from other parts of Italy received from those of Naples when they were induced to accept commissions in that city. One of the sufferers was DOMENICHINO. It is to be feared that he succumbed to the manoeuvres of his rivals. He tells a friend that he had two treatises on painting, one by LEON BAPTISTA ALBERTI, the architect, the other by LOMAZZO. The latter had said that the drawing or outline was the matter, and colour the form of painting. DOMENICHINO argued that the contrary is the fact; it is the outline or contour which gives being to objects, and colour without it cannot be expressive. A very different doctrine now prevails. Exactly the same lesson was conveyed by Sir EDWARD POYNTER in the address we published last week. MILLAIS, according to Mr. BRITON RIVIERE, valued a "clean edge," and said that a clear, direct work always tells in an exhibition. It was also Lord LEIGHTON'S opinion that unless a study can be modelled from it is of no use. DOMENICHINO was therefore possessed of principles which were enduring. But he could not resist the opposition of the Neapolitans. There is a legend that he was poisoned. LANFRANCO in particular seems to have been his enemy. He alleged that DOMENICHINO worked up his frescoes with pastel, and that the colour fell from the cupola in the chapel of the Duomo; that he was penurious and left his family in debt; that he was jealous of all artists except those belonging to the School of Bologna; and, indeed, a man who seemed to be most amiable was transferred into a mass of imperfections.

A refreshing contrast is afforded by the letters of SALVATOR ROSA. He was born in the Neapolitan territory if not in the city, and there is a good deal of similarity between his wild landscapes and his own character. But the letters which BOTTARI was able to rescue suggest that in the intervals of his storms he was generous. When he received an unexpectedly high price for a picture he offered to share the money with a friend. From his own account he was surrounded by men who liked him, although he is willing to confess that his temper is not of the best. He is fond of solitary walks. Sometimes he walks as if he were pursued, but occasionally he reads a book and prefers to think rather than speak. His health was not always good, and he could not comply with the demand for his pictures. If he had to paint through necessity it would kill him. The savage SALVATOR has aroused more of Mr. RUSKIN'S ire than any other landscapist. He compares him with ANGELICO and DÜRER as well as with TURNER, and finds brutality, viciousness, feebleness, ghastliness, ugliness and other evil qualities in his pictures. Seemingly he represented nature as it appeared to his own eyes, and many spectators of his paintings have recognised in them much that was akin to themselves. In the neighbourhood of Naples, and with volcanic forces not far off, it was hardly possible for a susceptible man to present the serenity which is to be found in the paintings of CLAUDE. We have, however, said enough to suggest some of the interest to be found in BOTTARI'S collection, although few readers, whether artists or amateurs, care to turn over his pages.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, Edwin T. Hall, vice-president, in the chair.

Mr. Alexander Graham (hon. secretary) announced the decease of Mr. Edward Morgan Whitaker, associate, 1882.

The CHAIRMAN said before they commenced the business of the evening he wished to acquaint them that that was the last general meeting of the Institute in which Mr. Locke would attend as secretary. They were aware Mr. Locke had resigned his position in consequence of the great success he had attained in that branch of art. Mr. Hall thought the members would be at such a meeting to take their leave of the retiring secretary in his official capacity, though they hoped to welcome him sometimes as a visitor at their meetings. Mr. Locke had been with them for ten years, and the chairman said that all members were agreed that he was at all times the most courteous secretary, who had made himself liked by everyone with whom he had come in contact. It was inevitable that such a change had happened, and Mr. Locke would leave the Institute in order that he might shine as a bright light in his profession. They did not, however, wish Mr. Locke to go away without an expression of appreciation for the work he had done during the ten years, and to wish him the greatest success in that branch of literary art which he had chosen for himself.

Mr. LOCKE said it was not without some emotion that he rose to take leave of a body with which he had been connected for so many years as he had with the members of the Institute. It had been a very great privilege to him as an outsider to go into the very midst of the profession and see it in all its aspects—artistic, professional and social, and to experience the kindness of the whole profession. His duties in the Institute had taught him a great deal of things, and they had also brought him into contact with many men, the remembrance of whom would perhaps be a great expression in the profession which he purposed to pursue exclusively in the future. His connection with the Institute had also brought him a great many friends, since he had come among them, a stranger, he had been received by all members, both in London and the provinces, with uniform consideration, kindness and courtesy. There had always been extended to him the hand of friendship. He would leave them with great regret and considerable pain, but he thanked them for the constant attention they had always shown him, and he thanked Mr. Hall for the remarks he had made. He hoped that although not able to serve the Institute much longer, yet his poor efforts in other directions might minister to its edification.

Mr. WM. WOODWARD read a paper which dealt with

### Recent Fire Legislation for London under the Factories and Workshop Acts of 1895 and 1901, the London Building Acts, 1894, and the London Building Acts (Amendment) Act, 1905.

He said that modern invention had led to the introduction of materials and methods of protection from fire which had vastly increased the opportunity for clearing a building of its inmates before the fire had a chance of getting into the structure. This consideration had not received the attention it deserved, either from the fire insurance companies or from the authorities administering the provisions of the Acts of Parliament. Sufficient study, again, did not appear to have been given to what are and what are not fire-resisting materials. It was by no means certain that the iron staircases to be seen outside large buildings in London would not prove a delusion and a snare in the case of a big fire, even assuming that nervous persons were induced to use those staircases at all. As regards the use of other stone "deemed to be fire-resisting" by the Acts of its solidity and durability" (Act of 1894, Schedule I) these materials could not be relied upon in the case of a big fire. The requirement in Schedule II, that iron and iron in beams or posts must be protected by plastering in cement or other incombustible or non-conducting external coating was, at least in the case of buildings of quite unnecessary. Timber was one of the best materials for a building on fire, and required no external coating of the nature described. The provision of oak, teak or hard timber for staircases was also unnecessary. Sound yellow deal or fir would be equally effective in the case of fire. If some undoubted preservative of

the effects of fire could be secured, much cost and labour would be saved. Professor Abel had specified the painting of the surfaces with a diluted solution of silica and limewash, then with slaked fat lime of the consistency of cream, then with a stronger solution of the same.

Mr. Woodward referred to the recent fire in Commercial Street, Lambeth, where two persons were burnt to death. On January 1, 1906, twenty-five lives had been lost, and upwards of five hundred seriously endangered, in houses of similar type, consisting of shop with room at back, and stairs leading to first and second floors, lath-and-plaster partitions matchboarded in parts, and no way out except by iron fixed ladders, if required, to the roof of the premises. No reasonable objection could be brought to this simple and inexpensive requirement.

Discussing some of the provisions of the Factory and Workshop Act, 1901, attention was directed to some undesirable requisitions under sub-section 2 of section 14, which had given rise to much litigation and much cost. A difficulty had arisen when a "factory" was in different parts of a building; the upper floors may have urgently needed means of escape in case of fire, which could only be provided by interfering with premises beneath, above, or around, the owner of which, not having forty persons employed, was outside the Act, and would not allow any means of escape to pass through or interfere with his premises. The London County Council, experiencing this difficulty, had provided for it in the London Building Act Amendment Act of 1905. Dealing with the working of the measure, Mr. Woodward referred to the three cases—(1) regard to 13 and 15 Leather Lane, 1 and 2 Grace Street, and 41 and 42 Beech Street—in which Mr. B. Tubbs had been successful in his appeals to the Tribunal of Appeal against the provision of ventilating shafts in these buildings, each of which was under 1,000 superficial. Mr. Tubbs in his evidence stated that he experimented on one of these smoke lobbies and found the air was drawn into the room rather than the lobby, driven out of it, and that on opening the door leading to the staircase the smoke rushed up the lobby; this appeared conclusive proof that the ventilators acted as inlet ventilators, and not as exhaust ventilators. It appeared also that the L.C.C. Building Act Committee were prepared to consider proposals of various alternative measures of escape, and one of them was a means of communication with adjoining buildings by means of ladders; but, unfortunately, the adjoining owners would not agree to these ladders, which formed an inexpensive and satisfactory means of escape, being placed on their premises. Mr. Woodward congratulated Mr. Tubbs on the success of his appeals. The result had been that the Building Act committee of the London County Council had considered the practice of the Council in cases arising under sections 7 and 9 of the Act, and had determined that, in similar cases to those the subject of the above appeals, enclosed fire-resisting or incombustible staircase with means of escape to and from the roof should be deemed sufficient for the purposes of the Act.

The author went on to summarise the machinery by which the Amendment Act works, dealing with "high" and "low" buildings under the headings of (a) As regards the Owner; (b) As regards the Council; (c) As regards the Tribunal of Appeal; (d) As regards the decision of the Council. Reference was made to the difficulties created by the "cubical extent" clauses. Since the trades had been opened up—such, for instance, as printing establishments, engineering works, motor-car repairs—which had been much hampered in their growth and developments by the fact that the Council had power to allow more than 450,000 cubic feet without effective party-walls and iron doors. The Council had seen how detrimental these provisions had been to modern ideas of large areas for modern buildings, but had had to keep in mind the risk of serious conflagrations in such large buildings were not subdivided by party-walls. The Council had now determined, he believed, to refer the matter to Parliament in the session of 1908 for power to amend the Building Act of 1894, as regards the cubical extent of buildings, in the following manner, viz.:—(1) Section 75 to be amended so as to enable the Council to allow horizontal separation; (2) Section 76 to be amended so as to remove all restrictions on the Council's

power to allow increased cubical capacity for buildings of the warehouse class; (3) Section 77 to be amended on the lines laid down in the London Building Acts (Amendment) Bill, 1905, so as to give the Council discretionary power with regard to openings in party-walls, the provision of fire-resisting doors constructed of materials other than iron, and the uniting of buildings. Amendment in the direction indicated would be a matter of satisfaction both to architects and to the public.

Mr. Woodward, in his conclusions, expressed the hope that the provisions of the Act would be interpreted in a fair and reasonable manner. The Act gave considerable latitude to the Council, and in practice it would be found quite reasonable to ease off some of its provisions. He would leave each case to be dealt with by the Council literally on its merits; and as in our Courts of Justice all decisions were subject to appeal, it might be desirable to give power to leave every decision to a Tribunal of Appeal. He thought the 9-inch newel wall to a staircase might be omitted in many instances; that the smoke lobbies might be omitted altogether; that the thickness of a wall-string might be less than  $1\frac{1}{2}$  inch; that the thickness of the panels of doors might also be less than  $1\frac{1}{2}$  inch; that the reduction of height in buildings from 60 feet to 50 feet was unnecessary, as the London Fire Brigade ought to be provided with appliances capable of rescuing persons from a burning building at a greater height than 50 feet. He was glad to see the elastic way in which the London County Council was dealing with projecting shops. He hoped the Council would modify all its requirements in the way of ventilating areas, including, of course, the vexatious trunks inside, and gratings in the fronts of buildings to take air into those areas. He should rely a little more on the ability to get out of a building on fire before that fire got a hold, but he would not stop short in any house in London in insisting upon a way out to the roof, and, having got there, a way on to adjoining premises.

Mr. J. DOUGLASS MATHEWS, in proposing a vote of thanks to Mr. Woodward, said he was in general accord with many of the remarks in the paper. Attention had been called to such undesirable requisitions in an Act as the smoke lobbies, and he was glad to hear the County Council saw the desirability of not taking further steps in the matter. He had taken part in considering previous Acts, and he was never convinced that there was necessity for smoke lobbies. The Institute, he thought, had a great deal to boast of in having been able to get the word "reasonable" introduced, for he believed it would be generally admitted the word "reasonable" had value. Another suggestion was that in all cases where the County Council had discretion to interpret a clause in the Act that it should be subject to the Tribunal of Appeal. The Act was a difficult and important one, and differences of opinion must necessarily arise in its operation, more especially in the adaptation of it. Mr. Woodward had also mentioned the escape to the roof. Possibly there was nothing so difficult as the arrangement for that in an ordinary dwelling. Supposing an escape to a roof was planned, naturally some kind of protection of the front would be necessary, and that might lead to sad consequences, because a person would not only have to get up to the parapet but to climb on to it before a fire escape could reach. Unless access was easy the arrangement would be a trap rather than an advantage. The London County Council were certainly taking an elastic view of certain clauses. It was difficult, he said, for such a body to take on the great responsibility indicated in the Act, and he thought it would simplify matters if they made suggestions to the various owners to do such and such things and put the responsibility on the owners. That would save the County Council very great trouble, because it would throw greater responsibility on the owners which they themselves would not be disposed to accept. He agreed with Mr. Woodward in the matter of legislation, and believed, if the public were treated as sensible beings, that a great deal of the Act could be put into operation without the pressure and enforcement of a public body.

Mr. W. E. RILEY said he wished to second the vote of thanks and to compliment Mr. Woodward on the extremely temperate tone he had adopted in his able paper. Fire in buildings, and especially in domestic buildings, was a gruesome subject, and legislation in connection with it needed care and consideration. He could not help, he said, being struck in the committee-rooms of the House of Commons and the House of Lords when the Bill, he referred more particularly to the Amendment Act, was before the committee, with the practical monotony of the testimony of those

whether in favour of the Bill or against it, but who were desirous to show that it was necessary to do something. Of those who were prepared to criticise the clauses of the Bill, nothing impressed him more than their final surrender to the conclusion that any amendment which tended to save life should not be neglected. The crux of the whole matter was that provision should be made to save life in case of fire. He was glad to be able to note that there was no disposition to charge those responsible for the administration of the Act with an iron inflexibility, which had in his opinion been too much spoken of in the past in dealing with the Building Act of 1894. That Act contained many positive and decisive clauses which gave the County Council and those responsible about the County Council no power to change the mere wording or the intention of the mere wording which was allowed in the clauses. It was for that reason those Acts were unpopular. Everyone, he said, knew that the promotion of the Act of 1905 was due to the dreadful fire in Queen Victoria Street, when the Home Office made representations after the finding of the jury, who added a rider to their verdict. The Home Office had just previously amended their Factory Act; but the first case tested under that Act proved it to be useless for its purpose, and it had to be abandoned. There were many fires previous to the promotion of the Bill, which had great influence on the trend of the clauses, especially those which dictated the requirements of domestic buildings over shops and premises of that kind. Mr. Riley then gave some statistics of losses through fire in inhabited buildings.

Mr. MAURICE B. ADAMS said the objection to outside escape staircases in domestic buildings was that they led to the increase of burglaries. He was in accord with the feeling which suggested the necessity for providing those escapes, but he saw some difficulty in dealing with the problem in that particular way.

Mr. JOHN SLATER said he was quite sure that everyone in the room was agreed that the people who were responsible for protecting persons from death by fire must feel that responsibility very heavily indeed. He did not suppose, he said, there was one person present who had had occasion to enter inhabited buildings in London, and who had not gone away assured that they were positive death-traps. He therefore had great sympathy with the endeavours of Mr. Riley. But he thought there was a great deal of force in what Mr. Woodward had said in regard to laying down hard and fast lines, whether they looked at the Act from the point of view of the owners or the County Council. Again, there was no advantage in laying down rigid provisions which might be evaded. He therefore came to the conclusion with regard to a very large number of requisitions alluded to in the Amendment Act, that it would be infinitely better to leave the matter in the hands of the County Council or district surveyors, and to treat each individual case in the way best fitted for it. Mr. Riley had mentioned instances which called for special treatment, and Mr. Maurice Adams had undoubtedly touched on a point of great importance. Then there was the kind of provision for escape in such buildings as hotels. He also thought in respect of the Amendment Act and in respect of many clauses of the original Building Act, that it was rather hard treatment on the architect who tried in every way possible to meet the reasonable requirements of the Acts, that he should have cast in his teeth such regulations as were made for people who would evade them. He could, however, testify to the extreme courtesy and consideration which he had met with when he had had occasion to go to the County Council upon such matters.

Mr. G. A. T. MIDDLETON suggested that balconies would afford a means of escape from a building, and there would not be the objection to them as was raised against external staircases.

Mr. L. HURST SEAGER also joined in the discussion.

The CHAIRMAN said architects not only shared in the responsibility of citizens in preventing loss of life, but there was a professional responsibility which made them most scrupulous and anxious to design their buildings with every provision for enabling persons to escape in case of fire. He agreed with Mr. Woodward that the provisions of the clauses in the Act should be as elastic as possible. In detached houses standing in their own grounds there was no necessity for providing an escape to the roof, and other examples could be cited. In place of smoke lobbies Mr. Hall suggested that windows on a staircase glazed halfway up would be found to be effectual.

The vote of thanks was passed by acclamation, and Mr. Woodward briefly replied.

## AMESBURY SCREEN AND FONT.

A SPECIAL service was held in Amesbury Church a week when the Bishop of Salisbury dedicated the restored font and screen, which have long been lost sight of in the building, and also the renovated chancel.

Unfortunately, in the "restoration" of fifty or sixty years ago, says the *Wiltshire Mirror*, many of the architectural adornments and handsome carved figures in stone or other stone were, for some reason, totally innocent at the present day, ruthlessly destroyed. For instance, the font, which now occupies its former position at the west end of the south aisle, was found under the altar broken into fifty or sixty pieces, and it took Mr. Kite many days of patient toil ere he pieced the fragments together, and it reflects great credit on his work that one can scarcely see the joints. The font, which is a Norman bowl, was supported by four columns of fourteenth-century pattern, though later a solid base must have been substituted. This has been recovered and utilised; the latter dates from the seventeenth century. The wall of polished Purbeck, and is so well restored that the pattern can still be seen, and in one corner the design is perfect.

Perhaps the greatest acquisition—or one would rather more correct in saying the recovery—is the old screen. This is of Perpendicular design and enhances the beauty of the church. It appears that this screen shared a similar fate to the font, being discarded though it escaped destruction. A certain Mr. Job Edwards, a lover of antiquities, who has long been laid to rest, by some means obtained this oak structure and placed it amongst the curiosities in a building which acquired the local designation of a "museum." On his death a horse dealer took over the premises, and his æsthetic tastes not being so well developed as his business capacity, he utilised the screen as a partition for a horse-box. Owing to the intervention of the War Office, it was saved from further damage. Being used in the way of course, was not conducive to the preservation of the woodwork, and when it passed into the hands of the architect, Mr. C. E. Ponting, of Marlborough, it was in a state. Fortunately this also was not beyond repair, while the whole work has been retained, several new pieces have had to be made.

A transformation has been made in the floor of the chancel. It was formerly paved with tiles, but, on removing these to get at the font which was known to be beneath, a number of ledger stones was discovered, and these have been used for paving. They are all very old, the inscription on one informing the reader that it was originally placed in that church to someone's memory in 1680. The upper part of the chancel has been laid in diagonal slabs of Forest of Dean stone, copies of two squares of which were discovered amongst the ruins which have been utilised with the others. In the upper part of the sanctuary the Hopton Wood stone is used.

In one of the large stones discovered under the chancel was embedded a thick brass plate with a Latin inscription. When this was deciphered it was found to supply a link with the past history of the neighbourhood. The inscription was as follows:—

"Here lieth Edith Matyn, late wife of Robert Matyn, who died — day of May, Anno Domini 1470.

To whom God grant peace."

Reference to Hoare's History shows that Edith Matyn was the wife of Robert Matyn, of Durrington, who left a will, dated 1509, "To my lady Prioress of Amesbury 3s. to every lady householder of the same place 8d., to my veiled lady 4d., to the parish church of Amesbury 10d. per sheep." The brass plate has been carefully cleaned and has now been placed on the wall of the chancel opposite the mural tablet which has just been erected. It is of an oval shape consisting of green marble bordered with raised black composition, and inscribed:—

"In memory of Constance Emily Vivian, wife of the Honourable Claude Panton Vivian, of Plasgwyn, Anglesey, and daughter of Jules Alexandre Sartoris, 16th Lane, London, born 20th July, 1857, died 20th October, 1905."

Besides the mural adornments the window on the north side has been carefully restored. Of course all this work can be seen, but there has been a good deal of money expended upon that which is out of sight. New foundations have been laid underneath the chancel, and the walls and buttresses, which previously rested on loose flint, have been underpinned with cement concrete. The roof came in for a good deal of attention. The whole of it was taken down with the exception of the timber, and the old tiles fitted

where missing by new ones. Two massive oak s span the chancel holding the roof plates together. surface gutters and drainage, which never before are now used and will help to preserve the ancient

### A LECTERN FROM HOLYROOD.

church of St. Stephen, St. Albans, is a lectern ch formerly belonged to Holyrood chapel. Accord- e *Scotsman*, St. Stephen's Church is in the centre ge and straggling parish, running far beyond the of the city, and yet partly in its boundaries. The was one of the three built by Abbot Ulsinus in 948. left of its Saxon foundation, though many of the ent periods can be traced built into its walls. It ored in the fifteenth century, but a hand abhorred antiquarian, that of Sir Gilbert Scott, passed over i, and what could be destroyed of the best work in ch was then accomplished. It stands on a hill, nd of the famous Watling Street, and for some s of its thousand years' stay the lectern of Holy- bbeys has stood in it. A noble "fowl," with h bald head, long neck, swelling breast, and ick wings of the date when he was cast and ed, not in silver but in brass. On the globe where s are spread is engraved the Scottish lion, ramping apant. Twice on either side appears his effigy. he upper part of the pedestal runs in Gothic letter- Georgius Creichtoun Episcopus Dunkeldensis." ottish bishops of Dunkeld claim that title; their e not far apart—1527 and 1550. One theory of the e of the lectern is that after its second restoration ch was dedicated by the Bishop of Dunkeld, and presented the lectern to the church. This is e, but is too obviously the ingenious invention of es which do not like to remember that Protector et wrought far more ruin and desolation among the churches and monasteries than was ever per- l by even the Scottish reformers or the more modern of Scotland.

re is a simpler explanation. Sir Richard Lee, a good of Hertfordshire, went as in duty bound northward e Protector. His services and those of his following aid in kind. He was given, or took, part of the of the abbey, and the lands, which included the of St. Stephen's, were also made his. When its long s was over and the baggage waggons which had anied the army to Scotland came slowly back over eat North Road, and when the loot was sorted from ny gear, what would be more natural than that Sir l should present to the church—which the war in d had given him—the church furniture, which bore ottish Lion and which would serve for all time to is name and generation. The brass font he seems presented to the abbey of St. Alban. The records tell it it fell into the hands of Cromwell's soldiers, and it nto the smelting furnace with other relics of more is metal. The lectern, if unprotected, most probably have shared the like fate, for Fairfax had his head- s at St. Albans, and the soldiers made searching tion. Most of the St. Albans churches were turned isons for Royalist prisoners. In St. Stephen's the n arches bear many a scratched record of their and their loyalty to the king. Fortunately for the of the lectern, there existed then a vicar wise in his d generation. He buried the lion and the eagle in a hich belonged to a family with the Scottish name of omery, and there it lay forgotten, or perhaps with se that the Scottish lion had best not be roused for other hundred years. During its repose General

Monk, advancing from Scotland in 1660, halted at St. Albans to send his message to the English Parliament. The Restora- tion was not to restore it to its place in the church. Three years after the fall of the Jacobite cause it was necessary to make another burial within the chancel, and the missing lectern was then discovered. Once again it stood in its appointed place, and with spread wings faces west.

Will it ever take the high road, and see again the walls of its ancient eyrie? The Church of England keeps a heavy hand on property, whether belonging to her or to other churches. The precautions taken effectually pre- vented any hasty removal of the Scottish property, and the lord of the manor spoke of the endless "faculties" required to free the lion and the eagle from the toils of the Church of England. Thus they were left still waiting. But the Bishop of Dunkeld's "feast" should come home to St. Giles's Cathedral to roost, and to bear again on its over- shadowing wings the Word, without which the people perish.

### TWO GREEK STATUES.

A LECTURE was delivered to a meeting of the French Literary Society, Liverpool, on Saturday evening, by M. Michel S. Ralli, on "Some Greek Statues." The lecturer chose two masterpieces for special consideration. The first, of marble, was found during excavations in the year 1879, and is considered by the best authorities to belong to the fourth century B.C., and to represent Hermes holding the infant Dionysius in his left arm, by the celebrated sculptor, Praxiteles. The other statue was only discovered in the spring of 1902 by some sailors in the Ionian Sea among the débris of a wreck which, from the evidence it afforded, must have occurred at a very early period. The statue is in bronze, and consisted when found of disjointed pieces, which were subsequently assembled by M. Andre, of Paris, and made to represent the original is nearly as possible. It was problematical what this statue was intended by the artist to symbolise. The figure held in the right hand an object similar in shape to a ball, and was probably a statue of "Paris with the Golden Apple." Another idea put forward was that the figure might possibly be that of Perseus bearing the head of Medusa, but M. Ralli gave reasons to show that the former supposition was the more worthy of acceptance. The discovery of this statue in the Ionian Sea, the lecturer observed, might be due to the fact that the Roman fleet under Sulla was wrecked there about 86 B.C., while carrying away the plunder of many Greek cities. M. Ralli concluded his lecture by remarking how fortunate it was for Greece that two of her most famous statues, which had been lost for nearly 2,000 years, had at last been restored to their native country.

### SHEFFIELD SOCIETY OF ARCHITECTS.

"SOME Churches of Northern France" was the subject of a lecture by Dr. G. Wilkinson before the Sheffield Society of Architects and Surveyors. Mr. W. J. Hale presided.

The lecturer began by referring to the chief characteristics of the design of the typical French, as compared with the English churches. The most striking feature of the former was the greater height of the vault. To maintain the vault in its elevated position, a much more elaborate system of external buttressing was necessary, and also a wider spreading base, to which the thrust of the vault might be conducted. Thus the French examples had generally a greater width than the English. The greater width was obtained by adding to the number of the aisles, and at the east end by a semicircle of radiating chapels round the apse forming the chevet. The French ground plan shows less extension of parts, the churches are generally shorter, and there is less projection of the transepts, whilst eastern transepts and eastward projecting lady chapels were distinctively English features. Spires or slender flèches were more frequent than groups of towers, which form such a marked feature of many English cathedrals. The French western façade was always an important feature, usually peopled with beautiful examples of Mediæval sculpture, in which branch of Gothic art France held the foremost place.

The lecture was illustrated by a number of lantern slides prepared from the lecturer's photographs of Amiens, Rheims, Noyon, Soissons and Laon.

## NOTES AND COMMENTS.

THE coroner's jury on Wednesday returned a verdict of accidental death at the adjourned inquest relating to the disaster at Blackfriars Bridge. No blame whatever was attributed to the contractors. The jury considered that the jacks and the girders were the best that could be provided according to our present knowledge of engineering science; that the simultaneous control of the jacks in the lowering and raising of the caisson was reasonably perfect. It was suggested that in future work of the kind the cocks should be protected by shields. When it is remembered that a coroner's jury in such cases rarely consists of experts the verdict is satisfactory. The report of Mr. C. A. BRERETON when it appears will no doubt confirm that of the jury in exonerating Sir WILLIAM ARROL & Co. from any suspicion of carelessness in the arrangements or of the absence of practical skill in the direction.

It is always fair to expect in an Irish law suit some peculiarities which are not usually found in similar cases in England and Scotland. One instance was a claim decided by Mr. Justice Ross on Monday after two or three days' hearing. The plaintiffs were builders who carried out a contract for erecting five blocks of artisans' dwellings, the amount being 3,110*l.* The architect, Mr. F. W. HIGGINBOTHAM, in granting his final certificate found that a sum of 71*l.* 3*s.* 2½*d.* was due to the plaintiffs, but that 210*l.* should be deducted on account of delay in completing the work. The plaintiffs maintained that the deductions were made by direction of the defendants, who were known as the Economical Housing Company, Ltd., and that Mr. HIGGINBOTHAM had in consequence disqualified himself from being recognised as a fair and impartial arbitrator. Mr. HIGGINBOTHAM's defence was that throughout he had acted fairly and impartially, that the works were delayed by the plaintiffs, and that there was no fraud or collusion between him and the defendants. Mr. Justice Ross held that there was neither collusion nor fraud, but neither the defendants nor the architect could be considered as entitled to deduct any sum by way of penalty. If a certificate had been given by the architect that the work could have been completed within the time specified, they would have had power to deduct, but in the absence of such preliminary certificate they had no jurisdiction. His Lordship therefore decided that the plaintiffs should receive the sum of 210*l.* as well as the sum of 71*l.* 3*s.* 2½*d.* The action against the architect was dismissed with costs and the defendants were ordered to pay the costs relating to the deduction. It was not stated whether the contract deed had any clause relating to penalties for delay, but it is generally understood that a right exists for the architect to deduct the amount from his final certificate without giving notices from time to time.

It is remarkable that, although the French Government are supposed to be the proprietors of the cathedrals and churches throughout the country, no definite arrangements have been made for meeting the expenditure on reparations. A case on a small scale which lately occurred will suggest the peculiar situation of affairs. In a small commune 16*l.* was voted for repairs to the parish church. The Prefect declined to approve of it on the ground that it was an indirect subvention to the exercise of worship. The case was brought under the notice of the Minister, and he informed the Prefect that he was to tolerate similar votes. What is meant by tolerating is uncertain, but it is considered that where the vote is for the security of the inhabitants in preventing the collapse of a structure or for the conservation of communal property the vote may be allowed. But there is no responsibility on any public body or collection of parishioners to give a vote, and the French people are rather indisposed to perform any duty which will increase their taxation. When the Separation Act was first made law it created associations which were to

represent the national ownership in the building, to become responsible for all expenses for their preservation. But that arrangement was found impossible. Afterwards, the communal or local authority was supposed to take over the buildings, although they may close them or prevent services in some circumstances, apparently they are not bound to keep them in a proper condition. It is not unusual that if the neglect continues the State may intervene and have the churches treated as dangerous structures with consequences resembling those adopted in London on the reports of the district surveyors.

## ILLUSTRATIONS.

BETHNAL GREEN MUNICIPAL BUILDINGS.

WE reproduce to-day a design, drawn by C. E. MALLOWS, virile in character and fine in conception. The council chamber, of the size stipulated in the conditions, was placed to the main front of the first floor and lit from above. All the offices were obtained on the ground floor and every part was well lit. The ancient lights were carefully considered, no infringement took place even after the future alterations. In the design placed first by Mr. HARE the council rooms were put in the basement which should have been put on the ground floor, and the council chamber was short of the size definitely stated in the conditions to be essential. This, of course, affected the contents and would help to pay for an unnecessary "campanile." In the report sent in with this design notice that the architect took the precaution of obtaining the guarantee of London builders to erect the building within his estimate and the amount allowed by the conditions. The defect of this plan would probably be that the lighting to the rates' office might not be strong. The access to the basement forecourts is also as also is the planning of the council chamber suitable for arrangements for receptions. The architect is PHILIP A. ROBSON, A.R.I.B.A., of Palace Chambers, 9 Bridge Street, Westminster.

CARDIFF EXCHANGE: THE ANNEKE.

COTTAGE, BLEDLLOW, BUCKS.

CATHEDRAL SERIES.—SOUTHWARK: FOX'S SCREEN.

WHEN JOHN CARTER in 1808 visited the church of St. Mary Overy, which is now the cathedral of Southwark, he found instead of the old reredos of those vulgar clumsy altarpieces in what is called "Grecian taste." It was made of wood and plaster, and rested against the ancient work. In 1829 it was arranged that a partial restoration of the tower and lady chapel was to be undertaken by GEORGE GUTHRIE. Another architect, ROBERT WALLACE, was entrusted with the alteration of the choir. The Grecian "frieze piece," which it is believed was designed by CHRISTOPHER WREN, was removed. The altar screen resembles the noble work erected by Bishop Fox at Winchester Cathedral. It is probable the Southwark screen was likewise erected at his expense at a time, for the London palace of the see of Winchester adjoined the priory church, and some of the predecessors of Fox were munificent benefactors of St. Mary's. In one feature the Southwark screen is preferable, for in the Winchester screen the figures of the two upper rows of niches stand on the capitals which are over the figures, whilst in St. Mary's the niches are separated by a band or frieze of azulejo. The figures in the niches were not likely to survive the surrender of the priory to HENRY VIII, but the canopies and other delicate parts of the screen which were preserved were ruthlessly broken when it was considered necessary to conceal a shrine which once contained images of saints in stone. The iron lines seen in the niches were part of the ornamentation introduced above the heads of the statues. The entablature of angels and shields is a modern addition designed by ROBERT WALLACE.

# THE LAYING-OUT OF LONDON.\*

(Concluded from last week.)

will notice that though I spoke at the beginning of my paper of making my imaginary London of the size as our present town, I have circumscribed it by an ellipse measuring only 6 miles north and south by 9 miles east and west. You will notice also that the circumference of the ellipse is a zone of green. Now, I am by no means saying that we could do with a town no bigger than this, but by 6, in fact, I realise that whatever size we may have for a modern city, that city, if conditions of life and health are healthy, is bound to spread. But I contend that we might reasonably make a stand against that gradual invasion of country by town, which makes for towniness.

There are some towns in continental Europe where towniness ends abruptly. Country and city meet at a town gate, with an effect as beautiful as it is striking. In England such a meeting of the sylvan with the urban is wonderfully rare. Even smallish country towns define their boundaries by some sordid compromise which is no credit either to the rural or the architectural. The shock of an abrupt contrast between wood-land pastoral scenery and town buildings is so great that one meets it, that one realises forcibly how rare it is. I know, as it happens, a happy little town not far from London, where the shops end suddenly in an avenue of great elms. The effect is so glorious that one senses how any town can deny itself the luxury of this natural nature.

For this reason that I propose in my imaginary city of green fields and woodlands round the limit of its activity. Suburbs can, if necessary, spring up outside the green girdle, but there would certainly be great assurance that the immediate contrast of the city with the world of green things should be one in which they respect one another. Not a region in which urbanity struggles with a landscape whose virginity is perpetual and gradual contamination. This green world, no doubt, contain recreation grounds and of entertainment, as well as, possibly, certain parks, on which the number of buildings would be restricted.

Essentially, you will observe that two roads follow the ellipse, the inner one being a specially broad highway. I have intended the roads for the special convenience of those who may want to get across from one main thoroughfare to another, which is often a difficult matter, and for the convenience of motorists who may require to get often do—to get from one side of London to the other without going through it. Such a road would very greatly simplify the task of getting, let us say, from the Strand to Harp to Camberwell.

At this time I feel that I have bored you sufficiently with my imaginary London, especially since I have, as I explained, no great enthusiasm for it myself. We are at once more to the question which embodies the practical use of this flight of fancy. The question is whether our imaginary city does really display some features which are good in themselves, is there any means whereby we can incorporate them in our present London? Many principal landmarks of my fantastic town are already suggested. I have pointed out. The general formation of our town bears a rough approximation to my scheme. We have a more or less rectangular formation, cut across by a number of diagonal tracks; but we are certainly ill-served with good through routes; we have far too many of congestion, our town lacks parallel roads to act as alternative routes and our methods of dealing with crossing are not equal to the requirements.

As to improvement of routes, I am afraid I must confess the egotism of referring those who are interested in the subject to the paper which I read before the Royal Institute of British Architects in May of last year. That was a criticism and an emendation of the scheme for new main thoroughfares proposed by the Royal Commission on London Traffic. The Commissioners' proposals, I believe, far from perfect; but they were based upon a study of the subject, and on a collection of facts which it would be most foolish to set aside. In fact, we might take it for granted that the two roads proposed by the Commission would meet an actual need; and I feel sure that the line of these streets were to be modified, not arbitrarily on the lines which I suggested—I am not self-

sufficient enough to insist on that—but upon some similar lines, actuated by similar principles, the gain to London traffic might be immense. I will merely say here, in regard to the details of my proposal, that my criticism of the east and west road was mainly by way of insisting that the route should neither destroy existing buildings of interest nor run past them at inelegant angles, and that my indictment of the Commissioners' north and south road was grounded not merely upon the same general principles, but particularly on the obvious responsibility of taking a street through Staple Inn and the Temple. I also drew attention to the undesirability of forgetting Kingsway. At great expense we have there secured a new highway, and we may as well make use of it as part of the system. Finally, I ventured to suggest that the two new roads might cross over and under one another in Russell Square.

Let us suppose, therefore, that the County Council have occupied the Traffic Commissioners' new streets; that some greater man than I has arrived at a scheme of modification identical with mine; that the Council have adopted this modification also and are prepared to let the whole proposal go forward, only keeping back the drafting of a Bill till the Architectural Association has had its say. What more should we ask for?

Gentlemen, I have a proposal to put before your consideration. I believe that my triple avenue linking east and west is not, in the present state of London, a right thing to ask for. Had it been the central street of a new city, it would, I hope, have made of itself a noble and useful highway; but at this present hour of need it would be, I believe, fantastic. Not so a modification of it, which I now offer.

Gradually during this evening you and I have been discovering the Surrey side. Do not let us allow it to relapse again into *terra incognita*. It really is the territory which lies between Westminster and the Mansion House, and it really might contain means of approach to other delights than those of the Elephant, other hospitalities than those of Bedlam. I want to ask you whether you cannot contemplate a fine street leading in a gentle but magnificent curve of about one mile radius from the east side of Westminster Bridge to the City. You will probably reply that there is such a means of progressing already, and that it is of no great convenience to struggle over London Bridge when you can drive comfortably along the Embankment. But I want to point out that the drive from Westminster Bridge to London Bridge on the Surrey side is not at all a direct or convenient one, and for that matter I don't propose to take any new road over London Bridge at all.

More than once have I been astonished by the dignified desolation which prevails in the south end of Queen Street. From the bustle of Cannon Street at its busy junction with Queen Victoria Street you may turn aside into a quiet and respectable thoroughfare, which reminds you by its air of repose of, let me say, a street in Bath or Stamford. You assume from the lull and the unfrequented roadway that its downward course is leading you to a *cul-de-sac*, and perhaps you wander down it to explore the dead end, when to your amazement you reascend a brisk incline to find yourself actually crossing the Thames on one of Rennie's masterpieces. In fact, you are on Southwark Bridge, and will soon be in Southwark Bridge Road, hurrying along to—may I mention it once more?—the Elephant and Castle, but by a much less frequented track than that of your fellow-mortals, who by four other bridges are all hurrying to the same Mecca. Why, I ask, should not a fine road connect Westminster and Southwark bridges with one another? Such a fine road as this would connect Belgravia with the Bank by a route actually shorter than the Embankment route, and much less obstructed at the finish. The first answer will be that the true secret of the boycotting of Southwark Bridge is the steepness of the gradient over the bridge and the smart dip which Queen Street takes to bring itself to the level of Upper Thames Street. But these levels are obstacles which can be got over, or even turned to account. In the first place Southwark Bridge would need, I think, some alteration to fit it for the needs of my proposed thoroughfare, and even if the piers are reused there would need to be some widening, and the excessive camber or arc of the roadway might be softened. In any case, it may be noticed that Upper Thames Street could easily be depressed at the point of intersection, and that Queen Street makes something of a struggle to reach its present level. Let the struggle be abandoned, and the result will be that Queen Street will pass very pleasantly over the head of Upper Thames Street, and will thereby lessen the rise which it makes in mounting the bridge. When once in the high

\* Paper by Mr. Paul Waterhouse read at the last meeting of the Architectural Association.

level it might retain its elevation all the way to Westminster Bridge, crossing over by viaduct all the streets it meets on its way, were it not for the railways, which already occupy the monopoly of elevation. Here I utter the aspiration that sooner or later there may be no railway bridge across the Thames within the metropolitan area, or at worst only one. For the purposes of goods traffic, I conclude that there must necessarily be at least one rail connection above ground between the north-side stations and those on the south side, but for all passenger purposes we should practically be as well off as we are at present if we abolished those stations which depend on bridges to take their traffic out of London, substituting for them stations on the south side of the river. A good system of tube railways, linking all the termini and giving connection from them to the business centres, would, as far as the majority are concerned, meet all genuine requirements quite as efficiently as the present system. Charing Cross, Holborn and Cannon Street are relics of the theory that the south side of the Thames is a tractless, cableless swamp. A few persons whose offices and places of business lie within a short walk of one or other of these stations would, of course, bitterly resent their abolition, but their number must be insignificant in comparison with the many thousands who employ some kind of conveyance after leaving the terminus. If the stations substituted for these three stations were ranged along the curve of my proposed new road, the distance of them from the main haunts of business would not be appreciably greater, on the average, than at present. In fact, the planting of the new County Council offices on the Surrey bank, and the probability that a business quarter will arise in connection with it, would have the result that the new stations would for some persons be actually nearer the seat of work than the present ones. In such a case you might even indulge me by letting the curved road be on the triple, or "three-way," formation.

But for the present we must assume that the railways and their detestable bridges remain. My visionary road must therefore dodge them, and I propose that on leaving Westminster Bridge it should pass under the South-Western Railway—rising to high level in time to run over Waterloo Road and Blackfriars Road—then again descending to pass twice under the South-Eastern. The distances between the points would allow these rises and falls to take place without undue steepness.

The difficulty of forming a new approach to the City is always said to lie in the enormous cost of City property, and the consequent difficulty of acquiring it for improvements, but the route I have indicated—by passing through a track less valuable than the City—helps us out of the dilemma. Queen Street, I fear, would need widening, and I regret it because I respect its air of provincial propriety. Again, I think it would be desirable to do something by way of relieving the already undue conflict of traffic at the awkward junction between Cannon Street and Queen Victoria Street, which my new street would rather add to than diminish. Perhaps an increase of road space at this point would meet the case. Happily the turning into Queen Street does not exactly coincide with this junction.

I do not like to indulge in talk about new streets without admitting that I realise a certain fact which is all-important. Traffic—one may put this as an axiom in the science of town improvement—traffic does not go from A to B; it certainly starts from A and reaches B, but it passes C and D and E, and all the rest of them—and the things passed are nearly as important to the traffic as the start and the goal. The man in a hurry in a hansom is only one man in a thousand. We must not forget that. It is true that he, and a certain number of his fellow-citizens in less expensive conveyances, do truly need to get from spot to spot with convenience, speed, and by a road of minimum length, but you will not get traffic to go along a road in anything like full strength merely because it is the shortest way, unless the road, besides being short, is also attractive commercially, or otherwise.

Look at Kingsway. You would have prophesied that directly the barriers were down the traffic would have poured through like Niagara. But no; these empty sites frighten the traffic—the street is used, of course, but with no ardour. Half the day you could play marbles in the roadway without undue anxiety. Therefore a new road must not be a dreary one, or it will cease to be useful. It must be lined with houses of attractive business (if it is in a business quarter), and it must pass certain points which are in themselves the objects of journeys. If my new street, or any new street, is to be lined with empty plots, or

with wholesale button houses, built in Fletton brick, had better not be a new street at all. It is greatly to the credit of wayfaring men, cabmen included, that they do not shudder at the horror of these dreary streets, whether they be caused from incompleteness or from the presence of joyless houses.

My suggested new street (together with the modification of the Traffic Commission's avenues) is but an example of one of the directions in which we might approach ideality. You will have gathered that time and space alone prevent my carrying this line of suggestion further; and no doubt you will have grasped the principle, which is this:—Take or make an ideal London (I do not press my own). See whether that can be made to bear any possible relation to London as it is. If it cannot, reject it; for the wholesale subversion of London would be a calamity. But if it does, then keep it, plan by you as representing the guiding model upon which to build, bit by bit, the improvements of London may be worked out. The initial process would, of course, take the form of incorporating upon a map of existing London such features of your Utopian plan as would really add to the convenience of our town without in the least case damaging any well-loved building, or even any handsome or beautiful line of street. To-night I have only stated the principle so far as to recommend some two or three new streets, to suggest that cross-river railways be abolished and to plead for some improvement in the points where great lines of traffic cross one another; but it might have gone further. I might have prayed for my girdle, for the parks lining the railways and for a new Tower Bridge.

I said, as perhaps you will remember, that our aim was to preserve what we love best need not be disturbed by the fact that London as we now have it is not the kind of city that it set out to be. The realisation that what once was a city surrounded by hamlets is now a connected metropolis is really a help and not a hindrance. London had always been of its present size, it would almost be impossible to effect improvements without incurring insufferable vandalism. There would be no trace of hallowed spots over which new streets could be laid without ploughing ruthlessly through sentiment and history. Had Londoners of past ages been in a position to appreciate what I have been dwelling on to-night—the importance of the Surrey side—we should find that, instead of mutilating Gravel Lane and New Cut to make a new approach, it might be necessary to do such things as were done at Whitehall when King Street disappeared.

Gentlemen, I have spoken too long and said too much. In all this time I have only scratched the top of my subject. You will perhaps feel also that, as an architect speaking to architects, I have said disgracefully little about the architectural side of the subject, but if you do feel that I respectfully say that you are wrong. Every consideration which affects the planning of a city is architectural. To look on cities as agglomerations of separate bits of architecture. So they are, true enough. But whenever questions of city planning arise they are of themselves architectural questions of a very specially architectural kind. It is true that architects very seldom have anything to do with any larger issues than the designing of individual buildings, and that when the larger issues do occur, which is not often in our old civilisations, those issues are left to be decided by the amateur decision of those heterogeneous persons whom we call public men. I do not know that anyone is to blame for this, but it is wrong, and it should be put right. It seldom occurs to anyone in particular, least of all to any collective public body, that the general problems of city arrangement are the kind of things about which architectural decisions should be taken, and they are consequently settled, as they are, by chance, by caprice, or by common sense, which is the very last kind of sense to apply to an acute architectural problem. For it is artistic, however practical it may be. People forget that. They forget that there is one art which deals with practical things and practical issues, an art which would lose its dignity if it ever forgets that these things are practical.

I don't overlook the welcome fact that the County Council has its own architectural adviser; but do you run a risk of seeing large London questions settled without his or any other architect's advice? Who was the architect who advised the Royal Commission on Traffic? There is not one.

It is a most unpleasant task to have to urge in favour of the employment of our own profession. Suggestions

or by an architectural society, that this, that or predicament is one in which an architect's are needed—such suggestions, I say, are very received with a wink. But do not let us be of the winks. We are quite sure we are in the whenever the proposals of the Traffic Commission, statements of London's difficulties, are taken there absolutely must be an architect or a small ee of architects appointed to assist in the working e scheme and to advise in the technical details that e in connection with the regulation of architectural t certain prominent parts of the new streets. Those the monarchs of our art cannot, for modesty, go on that some such architectural appointment should but those of us who have no immediate apprehen- being one of the selected advisers need have no real n or false shame about urging the necessity of ural advice. After all we are citizens as well as s—citizens of no mean city.

JOHN W. SIMPSON proposed a vote of thanks to the f the paper, and said he would like to call attention lightful and original idea of Mr. Waterhouse when i them to consider a London upon the old site, but w city. The idea was quite original, and the ng problem had been solved by Mr. Waterhouse. raker did not share in the surprise which was ed by the paper that the development of such a as laid down by the author should have led to a London very similar to what it was at present. reat city, town or village not forced into creation, eloped and grown in that same way. They need ack as far as the Roman encampment to find an since there were more homely examples in the t of a spring and the water well. Cottages e built round the well, afterwards the village ould be formed, then the market place and s leading to the necessary centre. Then would oads from that centre to the next village, town or d finally a street would be formed through cons ns of gradient and shelter from weather. They ind in Vitruvius the suggestion that roads should aid in such a course that they would be swept by illing winds. Another factor which would govern g-out of a street would be access to a man's piece ated ground and the happy accident which led to ice of position. It was the happy accidents which the ancient and Mediæval towns, and they must be accidents. Therefore he thought Mr. Waterhouse n very wise in suggesting modifications to a general . The rectangular parcelling out of townland was t economical arrangement, but the result was very esting. In the plan of New York there was very tistic interest, and it therefore seemed to him when h scheme was in hand, that while the engineer was ying-out his rectangular blocks, an artist should be him to occasionally jog his arm and so shift the . The artist, too, might assist when the scheme had d to building operations, so that there would be aces before the more important buildings, giving istinction. He counselled them to beware of the ical plan. It was the curse, he said, of city plan- to begin with, it could never be realised except on . If they studied the Mediæval and Renaissance ey would find that the results were not haphazard, outcome of carefully studied designs, and that the out of the streets, place, &c., was the result of a very tistic perception. Thus the place was seldom trical, it was nearly always irregular. With regard ern planning, Mr. Simpson said the English towns ly would compare very favourably with the con- ones, certainly from the points of view of hygiene onvenience of traffic, though perhaps the English the monumental character of the others.

GEORGE BARTLEY, who seconded the vote of thanks belonged to that dreadful body the Traffic Commis- hich seemed to have had all the sins put upon its cause it had not sought the advice of an architect. Commission had no buildings to design or roads to he did not see why an architect should be wanted, y were not in any way opposed to architects. When ffic Commission were suggesting two great thorough- o one imagined the routes would be made without ard to the buildings which might seem to obstruct urse.

A. BRUMWELL THOMAS and Messrs. ARTHUR KEEN, H. LEVERTON and G. M. NICHOLSON supported the

## THE LEGAL LIABILITY OF THE ARCHITECT.\*

AT the present time the architect belongs to what is called an open profession. That is to say, in order to practise as an architect, a person is not required by law to comply with the regulations of any particular body authorised to control and govern the profession, or to fulfil any statutory requirement whatsoever. Any man, at any moment, may hold himself out as an architect, ready to draft plans and supervise their execution for any member of the public.

But although the law imposes upon such a person no preliminary course of education or test of knowledge, as in the case of a solicitor or a surgeon, it does not contemplate, nor does it permit, the practice of the profession by an ignorant, unskilled person with impunity. Anyone who holds himself out as an architect, and practises as such for reward, is required by the law to possess an ordinary and reasonable amount of skill in his profession; whatever work he may undertake to do, he is expected by the law to display the requisite amount of knowledge in a reasonable degree, and to do his work with such proper care and such due diligence as would be held reasonably sufficient by the average experienced architect; and if he fail in these or in one of these, there follows on his failure a legal liability which may operate in many ways—such as rendering him unable to recover his fees, or making him liable to be sued for damages for his incompetence.† This is a liability which the law, when put in motion, does not hesitate to maintain.

Now, the functions of an architect are so complex and so manifold that while it is of great importance to him to be capable of performing them, it is of still greater advantage to his welfare that he should realise the duties and obligations which they severally impose upon him. Putting it very broadly, an architect may be employed merely as an adviser, or as a designer, or as agent for the building owner, or—which is more usual—as all three together. He may further be employed as valuer or dispute preventer between the contractor and the owner, or, lastly, as arbitrator. But it is more particularly as adviser, designer and agent of the building owner that an architect, *qua* architect, is employed, and this employment is multifarious enough to exhaust the activities of the majority of those practising the profession. For, amongst other duties, the architect has to advise his employer on the land upon which it is proposed to build, both with regard to any legal restrictions lying upon it and to its suitability for the purpose contemplated; it is his duty to examine the soil with care, both the actual building site and its environment; he must draft his plans, and draft them in accord with his employer's wishes and in regard to the actual conditions of the building site, and on receiving authority to proceed with the contemplated work must elaborate his drawings and plans in strict and full compliance with the scope of his authority; he must in similar compliance obtain all necessary tenders and prepare all building contracts required; and, when the work begins, he must supply the builder with all proper information; oversee the work and supervise the workmanship, and generally, as agent for his employer and within the limits of his appointment as such, see that the contract is being carried out in strict accordance with all its terms and conditions. Here, indeed, are formidable requisitions upon his professional skill, but even if he can answer them all with full technical capacity there is something more to be demanded of him. For there is attached to each of them the additional incubus of a legal liability. The architect, indeed, must walk warily, for every step in his progress through a contract is hedged about with duties and obligations which are legal in character and are capable of being legally enforced or of being expressed in legal damages.

In considering the various aspects of this legal liability, it will be convenient to regard the architect in all his various relationships, and consequently his liability may now be discussed, first, in his relation to his employer; second, in his relation to the contractor; third, in his relation to public authority; and fourth, in his relation to adjoining owners and others. And first,

### 1. In his Relation to the Building Owner or Employer.

This relationship is severable into three distinct kinds and capacities, the first being that of a mere adviser; the

\* A paper read before the Society of Architects by A. Montefiore Brice, of the Middle Temple and the Oxford Circuit, barrister-at-law, on December 12.

† *Columbus Co. v. Clowes* (1903), 1 K.B.D., 244.

second that of an independent contractor merely called upon to design and prepare good building plans; and the third being that of both designer and supervisor as the agent of the employer or building owner, a stage which commences as soon as he receives instructions from the building owner to prepare plans or to obtain tenders or to get the contemplated work or any portion of it carried out.

(a) *As Adviser.*—An architect may be, and frequently is, called in merely to advise a person contemplating the erection or alteration of a building. As an architect he holds himself out as possessing the necessary knowledge and practical skill, and as willing to exercise all reasonable care in giving such advice.\* He must exhibit these in all the matters on which he may be properly consulted—such, for example, as the limitations on the use of land on which it may be proposed to build, the nature of the soil, the plans and drawings, the obtaining of tenders, the preparation of contracts, the cost of the proposed work and the like. But there are limits to his liability. For example, while he will be required to show a correct knowledge of the general or local Acts and by-laws affecting the work on which he is asked to advise, he is not expected to give the advice which a lawyer would give, and should he be so misguided as to give legal advice to his client and his client be so adventurous as to follow that advice to his own detriment, the architect would not be liable for such advice. He is not a lawyer, nor does he hold himself out as one.

(b) *As Designer.*—In his character as the designer, the architect contracts to supply drawings and a specification which shall be executed with reasonable care and skill, and, further, shall be capable of being carried out. And the skill has been held to embrace and include judgment, for Bayley, J., pointed out in *Duncan v. Blundell*,† that “Where a person is employed in a work of skill, the employer buys both his labour and his judgment. He ought not to undertake the work if it cannot succeed, and he should know whether it will or not.” But this skill and this judgment need not be of the highest order, for it is sufficient in all cases where professional skill is sought and rendered for reward that the skill should be of a reasonably competent character. It is not evidence against the architect that some architects, of far greater experience or ability, might have used a greater degree of skill, or, indeed, even a greater degree of care. The true test is whether the skill was so deficient or the care was so defective that a bad result became inevitable. This test was held to be the true one by Chief Justice Erle, in *Rich v. Pierpont*.‡

It was long since held that if the architect should ignore the rules of his art it might be regarded as proof of unskillfulness,§ but this does not include any personal predilections for a peculiar or a novel treatment or any idiosyncrasy of style, provided that the work so conceived is feasible. On the other hand, his plans, in addition to complying with the requirements and instructions of the building owner or employer, must also comply with the various statutory and other regulations affecting such buildings as he may have agreed to design; must observe all legal restrictions, whether public or private, which relate to the use of the contemplated site; and must not permit a building to be defective in structural strength and construction.

Further, if an architect is requested by the building owner to furnish estimates of the probable cost of the designs and plans he has drawn, it is incumbent on him to act with honesty and skill in so estimating. Chief Justice Best held in *Money Penny v. Hartland*|| that a man should not estimate a work at a price at which he would not contract for it, for if he does he deceives his employer; and he would be further liable if by negligence he omitted details which would necessitate an additional order or a further contract. In this case he would be liable to the building owner, not for the cost of the additional work, but for damages for having negligently induced the owner to engage in a more expensive undertaking than he had intended. The case of *Money Penny v. Hartland*, cited above, is the authority for this.

It may be generally laid down that whenever an architect, by want of skill or care, advises the owner that a build-

ing will cost considerably less than it in fact does, the right to recover his fees and at the same time be liable to an action for damages by the owner. The difference between the estimated and actual cost must be considerable as to be evidence of the want of care on the part of the architect, and, of course, any estimate made at the request of the owner from mere sketches and undetailed instructions cannot be regarded as warranted to be exact. Moreover, the matter may be referable to the contract between the owner and the architect—was a condition expressed (or it be implied) that the estimate should be reasonable? For example, if the architect is requested to draw drawings and plans for a building, the cost of which is to exceed a certain sum, and he furnishes designs incapable of being executed for that sum, he cannot recover his fees. For he warrants technical skill and is bound to exercise care.\*

Even if the owner approves the drawings and specification of the architect, such approval will not of itself remove the liability of the architect for any technical error in them, for it is obvious that the owner must usually be incapable of forming a judgment upon such matters. This was decided in *Smith v. Barton*,† where the employer was held to be incompetent to judge of the accuracy and value of the drawings and specification submitted by the architect. There is always present an implied undertaking by the architect that the plans have been made with all professional care and skill.

In the absence of an express agreement to the contrary, it is the duty of the architect to deliver up his drawings and specification upon the payment of his fees. The absence of a custom to the contrary is no defence to the demand of the building owner for the plans.‡ Should there be a contract as to price and he should demand and be paid an unreasonable price, he is entitled to retain his drawings while he sues for his price, and if the price recovered be a reasonable price the architect is not liable in damages to the owner for the retention of the drawings while demanding an unreasonable price.§ The architect is bound to deliver all the drawings and the specification.

Finally, if an architect is only requested to draw drawings and the specification, and is not engaged to execute the actual work, his liability to the building owner is limited to the drawings and specification prepared. From them, he is not liable for any damage or defect which may arise in connection with the progress of a work which he has no control. But should the building owner mention to the architect while preparing the plans that a certain course is likely to be taken, and should that course be, in the circumstances, impossible or injurious or undesirable, the onus of pointing out this fact to the building owner rests with the architect, and the failure to do so may entitle him to his fees or render him liable to an action for damages, and the same would apply to the case where the owner overrules the architect's judgment, or insists on his own views being carried out in opposition to those of the architect. The latter may or may not comply with the owner's demands, but should he comply, it becomes his duty to point out to the owner the probable consequences of doing so.||

(c) *As Designer and Supervisor and Agent to the Building Owner.*—The architect incurs further and serious liability to the building owner or employer as soon as he agrees in addition to preparing drawings and specification, to intend the carrying out of these drawings and the specification by a builder. From the date of that agreement, when the work is complete, the architect becomes and remains with one or two exceptions mentioned below, the constant agent of the building owner, and expressly liable as such. The exceptions to this duration of the contract are illness and death. If an architect contracts and then becomes incapacitated him for a prolonged period, his employment is not obliged to wait until he recovers, if such waiting would prejudicially affect the employer's interests. If the architect or employer die, such death also terminates the contract, for, as regards the architect, his employment is a personal services, and arises out of his capacity and confidence that is felt in him, and, as regards the em-

itect is acting as his agent, and the death of a l puts an end to an agent's employment.\* duration of the contract between building owner itect may also be terminated by the architect com- a breach of it and his consequent dismissal by the r. He may also, of course, be wrongfully dis- it any time. If wrongfully dismissed the architect ring an action to obtain specific performance of the between him and his employer, nor can he obtain ction to restrain his employer from employing architect, for a contract of agency is always revoc- d in the case of an architect his services are . His only remedy is an action for damages.†

liability of the architect who has been engaged designer as supervisor of the execution of the plans esigned may now be considered briefly, and it will nient to take his chief duties and obligations in the g order:—

ie consideration of all possible limitations on the he proposed site and character of the projected

he examination of the site and soil.

he preparation of the plans, working drawings and ction.

he estimate of the cost of their execution.

he obtaining of tenders.

he preparation of the building contract.

he supervision of the work and the performance of es imposed by the contract.

he possible limitations on the use of the proposed generally legal limitations. Thus the erection of a g on a site may interfere with the rights of adjoining entitled to access to that site, or the character and of the building as planned by the architect may be ngement of certain Acts, whether general or local, ertain by-laws and regulations with which it is the the architect to make himself familiar. Igno- of these may lead to his client suffering —he may be fined or the building he has may be pulled down,‡ or the frontage may be set back. For such damage the building ould have redress against the architect, for if it is ously agreed, it is agreed by implication that the t will make the plans in accordance with the law. ction to this occurs when the law is so altered between ring of the plans and the completion of the building nder the building illegal. In this case the architect escape liability.

her, the architect is liable for the proper submission plans to the various public authorities, and for the giving of the necessary notices to all concerned. es the architect escape his liability by delegating this an assistant or the contractor, for (1) as a delegate he cannot, generally speaking, delegate his duties e principle of *delegatus non potest delegare*—and (2) es so delegate his duty he is still bound to see that ly performed.

too, with his duty to adjoining owners at this stage work. He is liable to the building owner for any : that person may sustain or become liable to sustain on of his architect's interference with such private y as the easements of air or light, or water or way, party walls or rights to support, or reservation of ls. In some instances he must observe special care, he case of party walls, which are not subject to any Act, but are governed by numerous local by-laws gulations, or the common law rights of the adjoining

se and similar matters impose a serious liability on itect, and he would be indeed ill-advised to place a g on a site without first assuring himself that his do so is perfect. Any carelessness in this matter, mple, might lead to his erecting his building, or a of it, upon another's freehold, and the consequences ould be (1) an action for trespass against the ct; (2) the appropriation or destruction of the build- an action for damages against the building owner by downer; and (3) an action for damages against the ct by the building owner.

liability of the architect for trespass—or a nuisance

acey v. McCabe (1893), 32 L.R., Ir., 21; Wentworth v. 839), 10 A. and E., 42.

rett v. East India and London Shipping Co., Ltd., 2 H. , 404; Chinnock v. Sainsbury, 3 L.T., 258.

opkins v. Smethwick Local Board (1890), 59 L.J., Q.B.,

—rests on the legal principle that in tort the fact of agency does not excuse. Every individual concerned in inflicting a wrong is himself answerable for the wrong.\* The build- ing owner and the architect would be equally personally liable to an action for damages, but the architect has his remedy over against his client for any damage he may suffer, if he can prove that, while he exercised all due diligence, he was himself deceived by the negligence or misrepresentation of his client.

2. The examination of the site and soil constitutes a further liability on the architect. He may delegate the work, but he cannot divest himself of his own responsibility. He must use all diligence and skill necessary to show whether the site and soil are in all particulars suitable for the building he proposes to place on them, and the subsoil as well as the surface ground must be ascertained and then considered in relation to the projected building. It was held in a famous case† that if the foundations for a build- ing prove to be bad, and the architect has failed to make a proper examination of the nature of the soil, he could not recover his fees. He would also be liable to an action for damages. The same liability would attach to him when building upon existing foundations; for it is his duty to examine them and if necessary test them to prove their suitability for the building to be placed upon them.

3. In preparing the plans, working drawings and speci- fication the architect impliedly undertakes that they shall be in accordance with the instructions received from his client, that they are in no way defective, that they comply with all statutory and other public regulations and that they do not impair any rights existing in the proposed site.

Thus, even if the employer's instructions are complied with and the plans meet with his unqualified approval, the architect is still liable for any defects of a constructional nature that may be latent in the plans, for the employer is as a not rule competent to detect these.‡

The architect is under a further liability to supply the contractor with all necessary drawings and the specification, in accordance with the specified contract time or at the proper time, as the case may be. But before he can be held liable to his client for damages in this respect, he is entitled to receive a demand for the required plans from the contractor,§ for the owner could not suffer damage by the delay in supplying the plans if the builder were not ready to work from them. In the event of the architect being in default in delivering drawings at the proper time, the architect may be sued by the employer, according to the circumstances, for damages for breach of contract or negligence, and the damages would relate to loss of profits due to delay in completion, to loss sustained by the employer through the builder either repudiating the contract or obtaining damages from the employer for his agent's delay, or to the penalties for delay which the employer has had to forego.

The architect, further, is liable for all omissions he may make in his drawings which involve additional work or new contracts, and he is also liable for all inaccuracies, omis- sions and unnecessary additions in his quantities, should he see fit to take these out. But it may be mentioned in respect of this, that it is not usual for a building owner to warrant quantities, and in such a case the architect, his agent, has no authority to do so on his behalf.

Further instances of the architect's liability with regard to drawings and plans are dealt with in section B, where the architect is considered as a designer.

4. In estimating the cost of the execution of the drawings and specification he has made, the architect contracts a further liability. He must possess the necessary pro- fessional knowledge and skill, and exercise the necessary care and diligence to render his estimate of price a reason- able one. If he fails to make such a reasonable estimate he cannot sue successfully for his fees and he may render himself liable to an action for damages. The circumstances of each case must be relied upon to provide evidence as to whether an estimate is reasonable or not. Chief Justice Best held in the leading case of *Money Penny v. Hartland*,|| that if a person by an inaccurate estimate induces another to undertake a work which, in the event of the real cost being represented to him, he would not have undertaken, the person furnishing the inaccurate estimate is not entitled to recover his fees. The architect, of course, should require

\* Mill v. Hawke (1875), L.R. 10 Ex., 92.

† Money Penny v. Hartland (1826), 2 C. and P., 378,

‡ Smith v. Barton (1866), 15 L. T. (N.S.), 294,

§ Stevens v. Taylor, 2 F. and F., 419, 421.

|| (1828) 2 C. and P., 378.

the fullest instructions and information, and, failing these, should notify his client that he can only vouch for the reasonable accuracy of his estimate in the special circumstances. Further, the situation may, and sometimes does, arise that there is neither an express nor implied contract that the estimate shall be reasonably accurate.\* It may be repeated here, too, that an architect is not entitled to recover his fees in respect of designs which could not be executed within the limit of the sum fixed for the cost of the building.†

5. In obtaining tenders for the building owner, the architect is usually bound by a time limit, and his failure to obtain such tenders within the prescribed time may involve him in a serious liability. Forfeiture of land through not building on it within a specified time, loss of the building season, loss of profits from the building are amongst the damage which may accrue to the building owner and rebound on to the architect. The information given to those who tender must be reasonably accurate, and any fraud or misrepresentation by the owner with the architect's knowledge or by the architect himself will render him liable to an action for damages. On the other hand it must be borne in mind that there is usually no warranty to the contractor that drawings are accurate or practicable, and the onus of discovering this rests on the contractor.‡

Should the architect accept tenders without the authority of his employer, the acceptance will not be valid: it is void *ab initio*. But if the employer subsequently confirms the acceptance by his agent, then that acceptance does not date from the time of confirmation by the employer, but it refers back to the time when the architect made his unauthorised acceptance.§ But the ratification by the employer is to be made within a reasonable time, and Lord Justice Fry held in *Metropolitan Asylums Board v. Kingham*,|| that such time could not extend till after the date at which the contract is to commence.

6. In preparing the building contract the architect enters upon a duty fraught with liability. It is true that he does not, *qua* architect, hold himself out to be a lawyer; but in matters which come within the scope of his employment as an architect he must be cognisant of the law, and in matters which are beyond the range of architectural knowledge and are legal in character, he must warn his client of the same and suggest or prescribe the taking of legal opinion.

But there are many things which he must know and must regard at his peril. He is obliged to know, for example, the ordinary conditions which are included in a building contract; he is obliged to see that they are there in order that his principal may be protected. But he is not obliged to warrant that the language in which they are expressed constitutes in law a binding agreement. The construction and interpretation of a contract and the determination of the precise meaning of its language are legal functions, and the architect would be exceeding his duty to warrant these, and if he did warrant them he would do so at his peril.

It is his duty, however, to be cognisant of the law. It is not his business to know the legal conditions which determine when a building contract need not be in writing, but it is his business to know that grave risks may attend a building contract which is not in writing and advise his client accordingly. He may not be required to determine when a person is an "adjoining owner" or not, but it is his business to know that a person may or may not be an "adjoining owner."

So the professional knowledge which he holds out and the care which he impliedly undertakes to use require him to observe all proper caution in considering the person or persons with whom or for whom a contract may be made. It is his duty to know that liability may or may not attach to certain contractors under given circumstances—such as in the case of Government departments, public servants, local authorities, corporations, companies, church building and club committees. In each case it is his duty to warn his client that special legal difficulties surround contracts made with such bodies, though it is not his duty to decide in any particular case what is the true legal course to pursue. His knowledge of law, in fact, must be knowledge of the point of contact between law and the practice of architecture, but it is not bound to include a knowledge of the result of that contact. Consequently, the prudent

architect will submit his contract to the test of legal before advising his client to adopt it.

7. In supervising the work and performing the imposed on him by the contract, the architect will be a special liability to his employer. It is not usual there should be a separate contract between architect and building owner, because, in the absence of such a contract there is always an implied contract that he is obliged to render skilled service in return for the agreed reward. Moreover, the contract between the building owner and the builder or contractor, which has in a very special way been brought to the notice of the architect seeing that he has drawn it up, usually sets out both the authority and obligations of the architect; and while he is not bound by an ordinary legal sense of the term a "party" to that contract it is generally the only instrument which authorises him to act as agent for the building owner, and at the same time sets out the limit of his authority and the extent of his liability in reference to the subject-matter of the contract.

Included in the proper supervision of a building is being carried out from its architect's or even the architect's plans, are the duties to inspect as often as necessary both materials employed and work done; to give necessary instructions and make all necessary corrections to provide the contractor at the proper time with requisite drawings, plans and specification; to measure the work accurately; to certify correctly for all charges, including penalties enforceable by the contract; to allow only those extras and variations which are within the term of the contract or his powers under the contract; to permit, and generally to see that the terms of the contract are fully and faithfully complied with.

In supervising the carrying-out of the contract the architect must not forget his duty to his client. He is agent or servant of that client, and it is good law that he must understand and no payment are permissible between the contractor and the architect, unless the employer is aware of it and an assenting party. Any payment which an architect may render a builder should be done on an act on behalf of his employer. He may not for payment take out quantities or supply drawings for the builder in order that the builder may do the agreed work, nor may he receive commission from the manufacturers or vendors of any materials or appliances whatsoever, provided the employer is ignorant of the arrangement. Dismissal without notice is the liability upon the architect for infringement of this rule.

Either as breaches of contract or as constituting negligence, the architect readily becomes liable for a number and variety of acts which are in the course of his duty when supervising the performance of the contract. His employer, for example, can bring an action for damages against him if he fails to inspect the work properly; if a work has been completed and does not comply with the contract, because at a certain stage of the work the architect passed as sound that which was unsound, the employer is entitled to proceed against the architect and to recover from him any additional cost which the tardy discovery of the defect might have involved.† But the employer is estopped by the act of his agent from recovering from the contractor a larger sum than it would have cost to set the defect had it been discovered by the architect with due diligence.

Other acts of negligence or breaches of contract consist of failure to measure up work or measure it properly; failure to certify properly—such as certifying for charges for his own omissions or neglect and for extras as due when not due; certifying for moneys or materials which are really forfeited under a re-entry clause; certifying for money not due and for charges which are incorrect or improper; certifying for work not complying with the terms of the contract, and the like. It should be remembered that even if extras are so necessary as to be indispensable to enable a contract to be completed, this does not justify an architect to certify for them unless he has (1) power under the contract to order such extras as he thinks fit, or (2) the authority of the building owner to allow the extras in question. Any extra or any alteration which is made by the builder without the permission of the building owner or the properly exercised authority of the architect is not recoverable by the builder or certifiable by the architect.

## SOCIETY OF ANTIQUARIES OF IRELAND.

PUTATION of the housing committee of the Royal Society of Antiquaries of Ireland on the 9th inst. upon the Right Hon. the Chief Secretary for Ireland in Castle in reference to the suggested housing of the Society. The following statement was made:—

Society was originally established at Kilkenny under the patronage of the Marquis of Ormonde, and usually grown in public favour until it has become one of its kind in the United Kingdom. From the income, derived wholly from the subscriptions of members, was mainly applied in the publication of a journal which is regarded as worthy of a place beside any other, and has now reached its thirty-fifth volume. The Society has also published an important series of volumes, and several antiquarian handbooks, which are mostly out of print. These have all been provided by the voluntary services of many willing helpers, and several high authorities in the sister island; and the Society receive or seek aid from Parliament as has been enjoyed by the Royal Irish Academy as a result of the recommendation of a select committee of the House of Commons many years ago. The Society is aided, with the aid of donations, a museum, which is public property. It remains at Kilkenny; but its most important contents were made over to the Museum in Dublin.

Society advanced so in prosperity and membership, that removal to the capital was eventually decided on. It enjoyed hospitable shelter from the Academy of the Royal Dublin Society, but it soon found the want of securing a meeting hall and offices for itself and library; and it is at present housed unsatisfactorily in Stephen's Green, Dublin, where its tenure is precarious and the accommodation available for its library collection of Irish photographs is such as to preclude general use.

Society is the only one of its kind having local representatives throughout Ireland in each province and in every county. It visits the provinces in turn, and its members have done much to promote an intelligent interest in numerous and important antiquarian remains throughout Ireland, as well as to stimulate historical research on a sound basis. In no part of the Empire do such appeals more to the national sentiment. The Society is called by the Government to aid it, not only by being members of the Board of Works' Advisory Commission on National Monuments, but quite recently to report on monuments as are on lands to be sold through the Land Commission. The relations of the Society to the Royal Irish Academy have always been most friendly. Most of our Council, and all who initiated this Society, are members of the Academy. But these two occupy different spheres. The Academy corresponds in Ireland to the Royal Societies of England and Scotland. The Royal Society of Antiquaries of Ireland corresponds to the Societies of Antiquaries of London and Edinburgh, both of which Societies have long been supplied with ample, in fact stately, accommodation by the State, through the Office of Works, has also relieved them of all rates. In no respect is the work of this Irish Society less useful, and if numbers in membership be a test of public appreciation, its claims are greater than those of any other. Besides the two Societies of Antiquaries in Great Britain, the State provides in London, in Burlington House, the suitable housing of some half-dozen other Societies, free of rent and taxes—the Royal Society, the Geological Society, the Linnean Society, the Chemical Society, the Royal Astronomical Society, &c.

The Society has long enjoyed the patronage of the Royal Family. Her late Majesty Queen Victoria became Patroness of the Society, and conferred on the Society its proper name, with the title "Royal." His Royal Highness the late Prince of Wales became a member, and so continued until his death. His Majesty King Edward VII. became a patron long before his accession to the Throne, and during his recent visit to Ireland, H.R.H. the Prince of Wales became a patron. The Society employs no paid officer, but one clerk; and if the necessity of paying rent, &c., all its funds are applied to the better production of its present publications, and to issuing others of great interest, which hitherto been unable to undertake. It now asks to be placed in the same position as the kindred Societies in England and Scotland have long enjoyed. The Royal Society of Antiquaries of Ireland, though younger than the kindred

Societies of England and Scotland, now greatly exceeds them all in membership, as the following quotation from the last Presidential address shows:—"The Society of Antiquaries of Scotland at the close of 1900, after a net loss of twenty-three in the year, numbered 687. The great Society of Antiquaries of London in 1899, after a less loss, numbered 750, so that there is not such disparity as might be expected between the antiquarian zeal of North and South Britain. The Royal Irish Academy, according to numerical summary appended to its list of members in 1902, was reduced to 255 members (besides 63 honorary), and of these science would probably claim half as exclusively its own. The number on our roll as to-day reported is 1,248, so that our Society in membership nearly equals those of the English and Scottish societies combined. If the roll of the Academy be added to ours, Ireland, comparatively small and poor, shows a larger number of persons devoted to the study of antiquities than does the British Isles styled Great."

One of the new lecture-rooms in the College of Science could be used for afternoon and evening meetings of the Society. There would not be more than two afternoon meetings and six evening meetings in the year. The number attending would not exceed 150 to 200. An ante-room suitable for use as a temporary tea-room on these occasions would be required. The rooms should afford comfortable seating accommodation, and as no doubt an apartment of this kind will be required by the Department of Agriculture for evening meetings and popular lectures, its occasional use as above by the Society would not entail any inconvenience. If the occasional use of a lecture-room in the College of Science were granted, it would follow that it would be more convenient to have the use of a business room in the same building. One fair-sized room might, under the circumstances, suit for both Council meetings and office, but it would require to be reserved for the exclusive use of the Society. If the room to be given for the exclusive use of the Society were large enough—say 700 or 800 feet superficial—it would probably be found sufficient for the 3,000 volumes which form the Society's library. The room to be appropriated for use as council-room and library would require to be furnished. We would also require fuel, cleaning and attendance, and it would be more convenient if the lighting were provided from the installation for the college than by a separate arrangement.

Mr. Birrell said he was in favour of the Society being taken into the new College of Science. He consulted Mr. Russell about the matter, who told him that the space in the new College of Science was already engaged. He would strongly represent the case to the Treasury, as he was satisfied of the justice of the claim for housing in the new College of Science, or, in the alternative, a grant to provide for it.

## THE REVIVAL OF CLASSIC ARCHITECTURE.

A LECTURE was delivered under the auspices of the Architectural Section of the Royal Philosophical Society of Glasgow, by Mr. J. Baird Thomson, on "The Revival of Classic Architecture." The lecturer gave a brief history of the revival or introduction of Classic architecture into England in the reign of Queen Elizabeth, and traced its developments during the reigns of the succeeding monarchs down to the present day. The reign of Elizabeth, he said, brought peace and religious liberty, and prosperity was the result. The Reformation was now accomplished, and the old idea of superstition and gloom as embodying true religion was now happily at an end. The demand was made for dwellings of all kinds of a light and cheerful appearance, and the old defensive castle was a thing of the past. Artists travelled that they might get new ideas. Among these was Inigo Jones, who became architect to King James I. of England, and we were indebted to him for introducing the Classic style as it existed in Italy. The new style became popular at once, and was practised by a succession of architects, such as Sir Christopher Wren, who succeeded Inigo Jones as king's architect, and had the honour of designing and executing the new cathedral of St. Paul's, London, one of the finest examples of the revival in its infancy. Sir William Chambers and the brothers Adam, among others, had given fine examples of the style. The lecture was illustrated with lantern views giving examples of the more important buildings which have been erected throughout Britain in the revived Classic style, which showed the gradual develop-

ment from a somewhat fantastical mixture of Gothic and Classical features to the more severe rendering of the first half of the nineteenth century, when the Grecian style was more practised than the Italian, and concluding with the mixed style of Italian or Georgian of our own day.

#### Illuminated Advertisements.

SIR,—The enclosed letter is being sent to the following societies:—The Royal Institution of British Architects, the National Trust for Preservation of Historic Spots and Natural Beauty, the Society for Protection of Ancient Buildings, the Society of Antiquarians, the Architectural Association, the Topographical Society, the Society of Arts and the London County Council.

I hope you will be able to find space to insert it.—Yours obediently,

JOSEPH PENNELL.

14 Buckingham Street, Strand, W.C.:

December 13.

The plague of flashing electric light advertisements and sky signs in our cities at night is on the increase, and seriously threatens the beauty and impressiveness of London, destroying architectural scale and dignity, and vulgarising most of the striking and interesting spots of our Metropolis. We have recently protested in the public Press against the vandalism of a prominent firm in spoiling a splendid river view by defacing the shot tower by an illuminated advertisement.

The chief offenders in this way are a few large, well-known firms, and it becomes a question, vital not only to artists, but to every one who values the architectural beauty and artistic aspects of London how long we are going to tolerate these insults to the eye. Why should a few pushful firms be allowed to trample on public rights of vision?

There is, however, a worse danger in allowing their continuance, and this is the danger quite real, that the public, growing accustomed to such intrusions, might, from enduring, actually grow to like these dazzling deformities.

We would respectfully urge that united action should be taken on the subject, and beg to suggest that, if your powerful and influential body would co-operate with other distinguished artistic associations and the leading societies for the protection and preservation of the public rights in the beauty of historic buildings and places, this gross abuse of advertising could be restrained in the true interests, as well as the dignity, of the nation by effective legislation.

We have the honour to be, yours obediently,

Walter Crane.

#### GENERAL.

The German Emperor was so pleased with the manner in which Mr. Guy Laking has arranged the armour in Windsor Castle, as well as in the Wallace Collection, that he has conferred upon him the Royal Order of the Crown of the Third Class.

M. Francois Flameng has nearly completed the portrait of Her Majesty, which will be exhibited in the next Salon exhibition.

The Competition for the decoration of the Mairie des Lilas, Paris, has passed through the first stage. MM. Gorgnet and Leroux, with M. Tardieu and M. Maret have been selected for the second competition. Medals have been awarded to MM. Abel Truchet, Casimacker, Cazes, Crébassa, Vielhorski.

Mrs. Fanny Peach, who died on November 27, daughter of the late Lieutenant W. Clarke, R.M., of Epperstone, Notts, bequeathed to the city of Nottingham a considerable number of paintings, engravings, curios and works of art, to be placed in the Museum at Nottingham Castle, and known as the "Clarke Collection."

Subject to the Approval of the City Council, the chester war memorial, the work of Mr. Hamo Thornycroft will be erected in St. Ann's Square, and will face Market Street. The base as proposed has been diminished in size to allow of the free passage of traffic.

Mr. Banister Fletcher is a candidate for the common councilman for the Ward of Farringdon Within.

A Society has been formed under the title of the "Architectural and Topographical Society," with a view to a complete architectural survey of Great Britain and Ireland. It is proposed to publish the information contained in quarterly parts and in some form convenient for reference. Further particulars as to subscribers and terms of reference will shortly be published.

Five Paintings have been stolen from the Musée d'Amiens. Two are by Fragonard, two by Vanloo and one by Boucher. The value of them is estimated at 10,000 francs.

A Subway is proposed to be constructed under the Champs-Élysées, Paris, at the Rue Marboeuf, at a cost of 67,000 francs. If successful others will afterwards be opened.

At a Meeting of the executive committee of the Abbey restoration fund at Selby on Tuesday, the proposal for the elevation of the abbey tower to its original height, in accordance with designs prepared by Mr. J. Oldrid Scott, London, was gone into and the tender of Mr. Thomas Ullathorne, of Selby, to carry out the work at a cost of 5,416*l.* was accepted. The work will be proceeded with immediately. The main oak choir screen is to cost 600*l.*; 10,000*l.* is still required to complete the restoration.

At a Meeting of the Lichfield City Council last week a letter was received from Mr. J. Frederick Green, secretary of the Johnson Club, London, stating that it had been resolved to support the appeal made by the Mayor and the Joint House Committee of Lichfield for the reparation and restoration of Dr. Samuel Johnson's birthplace at Lichfield and to co-operate with them in the bicentenary celebration of his birth. A letter was also read from Mr. W. B. Fitzgerald, stating that good progress was being made in the restoration of the statue of Boswell, which he intends to present to the city. The statue is to be placed beside that of Johnson in the Market Square. Mr. Fitzgerald had done all the designs on a small scale, and he thought it would be a very handsome addition to the city. It is expected to be finished within six months.

The Next Ordinary General Meeting of the Surveyors' Institution will be held on Monday, January 13, next. The paper will be read by Professor Henry Robinson (F.R.S.) entitled "Foreshore Erosion and Reclamation."

Mr. John C. L. Sparkes, who has been known for many years as a successful art master, died in his seventy-ninth year at his residence Newhurst, Surrey. His school at Lambeth was a nursery for Academicians and Associates of the Royal Academy. He was also for a time headmaster of the South Kensington School. He rendered services to Messrs. Doult & Co. in connection with the art department of their potteries.

The London County Council on Tuesday agreed to erect a statue of the late Sir Wilfrid Lawson to be given by the Victoria Embankment Gardens. The statue will be placed opposite Cleopatra's Needle.

Tenders have been Accepted for the erection of the new building for the fine art section of the Scottish National Exhibition, which is to be held next year in Edinburgh. It will be a collection of works by Scottish painters from the time of Jameson.

The Holborn Borough Council last week adopted a recommendation from the works and general purposes committee to make a new thoroughfare to run from Torrington Square to Montague Place, and to terminate at the new north front of the British Museum building. It has been decided to erect. The cost of the scheme is estimated at 6,460*l.*, and the Council's share of the expenditure during the first year would be 1,300*l.* The Council proposed to give towards the cost of making the new street three-fifths of the amount.

The Paddington Borough Council have agreed to contribute 2,112*l.*, or one-ninth of the estimated cost (19,000*l.*) of forming a crescent carriageway, 85 feet wide, terminating at the rear of the Marble Arch, and thus isolating the arch. The Westminster City Council have agreed to contribute a similar sum.

## THE WEEK.

te FREDERICK STACPOOLE, who died on the st. in his ninety-fourth year, was nearly the last English engravers. Between 1858 and 1893 he ited several plates to the Academy exhibition. o 1858 he was represented by paintings, and rom 1894 to 1899. He won medals in the y schools in 1839 and 1841. He will be remem- y his engravings. He began with "The Straw- irl," after REYNOLDS, and then produced plates rraits by GRANT and GORDON. His first large is a "Drawing-room at St. James's Palace," which ibited in 1869 and became popular. Among ates of his which are to be seen on the walls of ouses are "The Palm Offering" (F. GOODALL), "Out" (T. FAED), "School Revisited" (G. D. "Quatre-Bras, 1815" (E. THOMPSON), "Forget- s" (J. SANT), "The Shadow of the Cross" (N HUNT). Mr. STACPOOLE engraved no less than plates after Mr. BRITON RIVIERE's paintings of Mr. BURTON BARBER'S. His style was mixed well suited for reproduction of modern paint- fr. STACPOOLE was elected an associate engraver Judging from the present practice, it is not that he will be the last representative of the r's art to be admitted among the members of yal Academy. Originally engravers were ex- although they were admitted in all the Academies Continent. The rule was made through dislike RT STRANGE. Afterwards BARTOLOZZI was Subsequently it was agreed that engravers come associates, and the first representative seal engraver to the KING. Later it was re- to have six engravers, but they were to be s of a special class who were not to have the voting on any occasion. The alleged reason opposition to engravers was that engraving was for art not fitted to rank with painting, sculpture hitecture.

Corporation of Glasgow, undaunted by the of the former attempt to obtain possession of s without paying for them or paying an inade- ice, have resolved to make another experiment. as been prepared by which a register is to be p in which will be entered the width of each he distance between the centre of road and line, the character of the street and other ars. Copies of the entries are to be sent to the of property in order that they may appeal if y. All the appeals are to be heard by the who has the power to alter the register. At first e Bill, which seeks authority for the preparation mended register, appears to be innocent. But e revolutionary measure which contemplated tion in connection with a similar register, it is to suppose that the Corporation have no other a-view than the compilation of a more satis- record of property in the streets of Glasgow e which has served for over forty years.

to be hoped there will be no further impedi- o the proposal for utilising the site of the Royal y at Manchester for a public library and art After the careful report of Mr. T. E. COLLICUTT, it vitable that such a project would be adopted by a of the City Council. The site could, no doubt, ted for various purposes, or it might be wholly ally left as an open space, which would add to thinness as well as the amenity of the city. But : worthy public library and art gallery is l than at present exists, and if the Infirmary site t utilised for the purpose it is doubtful when equally eligible would be obtained. By a large t it has been decided that the special committee-

be instructed to prepare for submission to the Council a scheme embodying instructions to architects for com- petitive designs for a new building to be erected on the Infirmary site, for the purpose of meeting the require- ments of the libraries committee and the art gallery committee, and any other committee or committees as shall hereafter be determined by the Council on the recommendation of the special committee.

THE ancient cathedral town of St. Pol de Leon, with its great spire, which is nearly 400 feet high, is known to students and tourists in Brittany. Near it is the small town of Roscoff, and opposite the latter is the Ile-Bas. All these places are associated with the life of MARY Queen of Scots. At a recent meeting of the Antiquarian Society of Edinburgh, Lord GUTHRIE discussed the questions, "Did MARY STUART land at Roscoff in 1548; and did she erect there the still exist- ing but ruinous chapel called locally sometimes La Chapelle de Marie Stuart, and sometimes La Chapelle de St. Ninian?" A letter is still extant in which the courtier who accompanied MARY from Scotland wrote, "Nous fimes notre descente en ce lieu de St Pol de Léon," and there were doubts whether the words should be translated, "We landed here at St. Pol de Leon," or "We arrived in this place of St. Pol de Leon." It is possible that MARY landed at Roscoff, or rather Ile-Bas, and would have erected a church in thanksgiving for her safe voyage. Lord GUTHRIE said there is a chapel which locally goes by the name of the chapel of MARY STUART; an adjoining ancient house, with a quaint garden, is said to be the house and garden of MARY STUART, and in the big church at Roscoff they cherished among their chief treasures a silver statue of the Blessed Virgin and an amber rosary of rare and beautiful workmanship as gifts of the Queen of Scots to the chapel before it was wrecked at the Revolution, and removed at that time to the parish church. Most important of all, the chapel was known locally not only as La Chapelle de Marie Stuart, but also as La Chapelle de St. Ninian. If the Roscoff people are asked who St. NINIAN was, they will answer that the name had often puzzled them. He had had letters from French antiquaries in other parts of Brittany asking where the saint hailed from, for they could not find his name in any list of French saints. In Scotland they knew St. NINIAN or St. RINGAN as the founder of Whithorn, in Galloway, a favourite pilgrimage church of the Royal STUARTS, MARY'S ancestors. Lord GUTHRIE showed a number of lantern slides from photo- graphs taken by his daughter, exhibiting the present deplorable state of the roofless building.

STANDARDISING has been found advantageous in engineering, but it is difficult to employ it in the fine arts. All agree, for instance, that their aim is the pro- duction of beauty. But who can determine a standard which will be not only generally applicable, but will be accepted by artists and theorists? The problem of proportion may be said to resolve itself into one of measurement, or, in other words, nearly approaches science. But there never was a painter or sculptor of any note who did not believe that he followed a standard of his own, and could afford to be dubious about those deduced by anatomists. As for colour there is still more uncertainty, and able painters sometimes fail in demonstrating that they are equal to semi-barbarian craftsmen. It is possible, however, to devise a standard which can be useful in many of the industrial arts. An attempt of the kind is seen in a volume published by MESSRS. SCOTT, GREENWOOD & SON, "Three Hundred Shades and How to Mix Them," of which the author is a French decorator, M. DESAINT. Each colour is represented by an example which is large enough for use, and they are protected by tissue paper, which will serve to make them enduring. At the end is a classified list, easily understood, which will enable painters to arrive at the tint desired.

## THE INELASTIC LAW COURTS.

THE famous old court of Lincoln's Inn, of which the occupation was gone since the Law Courts in the Strand were erected, was recently utilised and the latest appointed judge, Mr. Justice EVE, presided in it. Like other proceedings connected with the Chancery Division, that event was taken as inevitable, and no complaints were raised by judges, counsel, solicitors or clients. But when last week a temporary court was fitted up in the Grand Hall of the Strand building and Mr. Justice DARLING took possession of it for a day, the event was treated by his Lordship partly seriously and partly humorously. He said:—"The number of judges has been increased, but naturally enough the number of courts has not. If we all have to sit somewhere, it is obvious that I could sit nowhere but in this particular place, and it was pointed out that this hall has served in the past no purpose whatever. This is a Gothic building, with, to my mind, a most ornamental façade and full of windows that exclude light and passages that lead to nothing, but ill-designed for the administration of justice. I hope that no one will think that in sitting here I have been guilty of any radical departure from old rule, because this is really a return to the time when the King's Bench sat, as it was called by BRETT, *in aula Regis*—in the hall of the king—and we are simply returning to the practice of Norman times. I mention this because I myself should regret to be guilty of any modern innovation. This Court sits precisely as it did in feudal days, and will attempt to administer justice in the old way."

His Lordship is courageous, and he might therefore have pointed the moral of the improvised court by stating the historical fact that the Law Courts were devised by a body of able lawyers, and that most of the defects, if not all, are owing to that circumstance. The majority of people who read his Lordship's remarks no doubt thought that the new enclosure was the result of an architect's blundering, like the windows which exclude the light. As to the passages which lead to nothing, they were necessary for the completion of the quotation. But the words were hardly applicable to the Strand building, or, indeed, to any other. One of the aims of the legal committee was to have not only the various courts combined as it were under one roof, but to bring near them the numerous officials more or less connected with the administration of the law. In consequence there are several corridors for the purposes of communication. It may often seem unnecessary to have a long approach in order to reach an official who may be considered unimportant by the judges. But all those officers were contemplated as indispensable by the committee of lawyers.

It is worth remembering that the Courts of Justice Commission began its work in 1865. After forty-two years the history of the body is likely to be forgotten. It may therefore be stated that what was known as the Carey Street site was fixed on before the Commission was appointed. What the Commission had to do was to report to the Government about the best way of erecting the courts of law. The members did not regard the site as too small. It was to cost 750,000*l.*, and a similar amount was to be expended on buildings. A preliminary plan was prepared by Mr. ABRAHAM, an architect; and a committee, of which Lord CRANWORTH, who held the office of Lord Chancellor, was chairman, considered the plan was adequate for the requirements of the courts. Afterwards it was decided that the Wills and Bankruptcy Courts should be struck out, and that Doctors' Commons should remain where it was. The committee were not depending altogether on their own experience. From the Foreign Office information was obtained respecting the accommodation of law courts throughout Europe. The judges when they went to the assizes made inquiries concerning the courts. It is curious, but one of the advantages of the

Strand site was stated to be that the public was prevented as much as possible from attending the courts. Compared with the old courts at Westminister and at Lincoln's Inn, which were open to all, the Strand buildings are most inaccessible, considering the manner in which the public could get to the courts, that is not altogether a disadvantage.

Before a final decision was arrived at a different site was suggested. It was proposed to erect buildings on the south side of Howard Street, the principal frontage to the Thames Embankment, Clare Market and its purlieu was supposed to be unworthy of such a building, and the land which had been purchased in the neighbourhood of Carey Street it was believed could be utilised for buildings of a different class. Mr. STREET made fresh designs for a new site, which he considered was far better adapted for architectural display. In the Strand the Law Courts could not be seen from the Houses of Parliament, but, according to him, there would be a commanding view of them if they were erected at the Howard Street site. Mr. ROBERT LOWE was then Chancellor of the Exchequer, and one of his ideas was to have the new buildings erected according to the plan which INIGO JONES prepared for the Palace of Westminster, and of which only the banqueting-hall was carried out. That fact was by itself almost enough to revive the uncertainty prevailing after four years' deliberation over a great many projects. Another proposition was that the style of Somerset House should be employed. Subsequently the Government returned to the plan originally proposed. With superiors like Lord ALBERT Ayrton it was difficult for the architect to say anything about what he was to perform, for with the notion of being economical and saving the Treasury, suggestions of change were continually arising.

Take one instance which is closely related to the improvised court. Westminster Hall was indispensable when the courts were held alongside of it. So the Continental law courts possessed similar places for meetings and consultations. A great hall was therefore considered to be necessary in the new courts in the Strand. But JAMES FERGUSON, who had been Director of Works during the commissionership of AUGUSTUS P. LAYARD, considered the hall the most objectionable feature in all the objectionable features in the design. He described it as an imperforate, gloomy and solid mass, and prophesied that sooner or later the superior authorities would order its demolition. Most of the visitors represented an expenditure of 100,000*l.* A majority of visitors in our time would be inclined to say that the hall was the only place where a visitor could breathe in the building. But Mr. JUSTICE DARLING, who we suppose, like the majority of the judges, enters the building by the northern entrance, does not regard the hall to have no purpose whatever, and we suppose he regards it as so much wasted area. Yet the hall might be turned to account for temporary courts and, as his Lordship pointed out, with precedents for their existence.

Even if it should be allowed that the weakness of the building is found in the planning, it can be said that contemporary architects generally agreed that Mr. STREET's plan was not entitled to take the first prize. That of EDWARD M. BARRY was awarded the first prize in the competition, while Mr. STREET's attracted little or no attention. Any defect which arises should, therefore, be attached to the Government of the time, and not to the architect. Gothic was then in fashion and a great many influential people, and it is not to be wondered at if a stalwart representative of the style was able to triumph over the general convenience. Subsequently Mr. STREET's design was altered, but with the sacrifice of the principal façade it was impossible to secure perfection of planning.

When the project for the erection of the law courts was determined, it was believed that the provisions were ample for the administration of justice on a

Some of the higher English officials believe in ration, and the Law Courts exemplify the. Whether the advantages are more than al is a question which should be made the of a royal commission. A large amount of legal gone through without any appearance in one of ts. It was Mr. STREET's aim to suggest that edure which is followed is not uniform, and in ence the eastern façade, near which the offices id, differs in treatment from the western part. t was proposed to sacrifice the Carey Street the sake of the Howard Street site, there ome experts who suggested that great compromise, for they said that instead of ale withdrawal of courts and offices, only them should be transferred southwards. An n of the existing courts would be difficult, for roperty in the neighbourhood has increased in ad some public buildings have been erected would be unwise to supersede. If temporary o not satisfy the judges—and it must be owned nent structure is more in keeping with ideas of ustice—the only way out of the difficulty will be re some of the offices or "nothings" to which ages lead and to convert them into courts. It o doubt be more or less unsatisfactory in an ural sense, for the new courts might not be ve, but it would at least satisfy the advocates on," for they could pass from one court of o another without leaving the building.

#### WITHIN THE GREEK TEMPLE.

EW years before the Germans began their xploration of Olympia not one house marked of what many scholars considered to be the cred area in all Greece. Tradition alone was pended on when it was decided to remove the ted earth—in parts 20 feet in depth—from ous enclosure. The results of several years' now known throughout the world. ntion was of course mainly bestowed on the g of the Temple of Zeus, of which LIBON was nitect. What remains has increased our know- the arrangement of a great temple. PAUSANIAS d it was not covered with ordinary tiles, but bs of Pentelic marble cut in the form of tiles, e believed were the invention of BYSES, a . Apparently they allowed a soft light for the tion of the interior. There was a gallery, and se a staircase, from which could be seen the the great statue of the god, which was modelled OMER's description by PHIDIAS, the son of DES, an Athenian. This masterpiece of ivory l stood in the western division of the temple. as a middle division which the winners of the games had the privilege of entering, and the division was more or less public, for every day ple of Olympia offered sacrifices to ZEUS. IAS was unable to approach sufficiently close to ue to give a description of the details or to e the height and breadth. great temple was the most important of those nopia. PAUSANIAS, like most visitors, was pro- verwhelmed with the majesty of the statue and ocations of the building. He seems to be more ase when describing the Heraion, or Temple of hich was found close to the northern boundary aced enclosure near the treasuries. The traveller Romanised Greek, and he knew the respect in ERA or JUNO was held in the capital. Accord- e enters into unusual detail when describing the of the goddess. tells us it was a Doric temple surrounded by s, but the name of the architect was unknown. IAS observed that one among the columns was hich we suppose was a survival of a more

ancient building. The preparation of a pepum or veil for ATHENE was an event for Athenian maidens, and in Olympia sixteen matrons every five years embroidered one for JUNO, and they also had prominent parts in the festivals of the goddess. Their daughters also competed in special races over a shortened course, and the victors were crowned with wild olive. They were permitted to eat of the meat offered in sacrifice, and might even have their portraits taken as memorials. The origin of such a peculiar celebration was attributed to HIPPODAMIA, the bride of PELOPS. According to another account, in one of the quarrels between the people of Elis and Pisa sixteen matrons conducted the negotiations for peace, and the event was kept in remembrance by the ceremonies described above. PAUSANIAS says that in his time there were eight tribes, and each selected two matrons for representatives.

Within the temple was a figure of HERA seated on a throne. ZEUS was near, and appeared with a helmet on his head, which was unusual. Apparently the figures were ancient and rude. There were also figures of the Hours, of THEMIS, the Hesperides, ATHENE, CERES and PROSERPINE, APOLLO and DIANA, LATONA, Fortune, BACCHUS and a Winged Victory. PAUSANIAS says they were all ancient and formed of gold and ivory. He mentions others which were more modern in style, such as a *Mercury Carrying the Baby Bacchus* on his arm by PRAXITELES. There is no doubt that he was referring to the noble work found at the Heraion, and which, although incomplete, is almost a sufficient reward for the labours of the Germans. There were also seen by PAUSANIAS a *Fortune* by the same master, a *Venus* in bronze, &c.

Probably none of the statues received so much attention from visitors as a coffer of cedar of which the upper part was adorned with figures of animals, some in gold, some in ivory, while others were carved on the cedar. We may suppose that chryselephantine work was familiar in Olympia, and therefore PERICLES ordered the figure of ZEUS, which was to be an offering, to be executed in a similar manner. According to tradition, CYPSELUS of Corinth was concealed when a baby in the coffer, and it was afterwards offered in thanksgiving to the temple. Strange inscriptions were seen on it which PAUSANIAS was unable to interpret. Some legends were illustrated by paintings or carvings. One was the chariot-racing of PELOPS, in which many figures were introduced. Apparently that race suggested others to the artist, which were more ancient, until at last HERCULES himself appeared drawn by four horses. On the left side of the coffer a woman was seen holding two infants—one black, the other white; they symbolised Death and Sleep, and the woman was Night. Another woman was seen beating a second, and suggested Justice punishing Injustice. Two women were represented pounding something in mortars, which, we suppose, was also allegorical. MENELAUS was seen with a sword pursuing HELEN, MEDEA appeared on a throne with JASON and VENUS at the sides, APOLLO was conducting a concert of the Muses, ATLAS was holding the golden fruit; MARS and VENUS, THEBES and PELEUS came next, and finally the two winged sisters of MEDUSA were shown in pursuit of THESEUS. Other myths served as subjects for the opposite side. BOREAS was shown carrying off OREITHYIA, the beautiful daughter of the King of ATTICA; HERCULES fought with the triple-bodied GERYON; THESEUS was playing the lyre for the delight of ARIADNE; ACHILLES fought with the young MEMNON; MELANION stood beside ATALANTA; HECTOR and AJAX were incited to fight by DISCORD (and, as PAUSANIAS observed, the figure of the goddess was repeated by CALYPHON of Samos in the Temple of Diana at Ephesus), and HELEN of Troy with the DIOSCURI. On the back of the coffer warriors were represented, but there was a difference of opinion concerning the interpretation, for, in spite of their familiarity with the legends of their country and the skill of the artists, doubts often arose about the meaning of subjects.

PAUSANIAS believed that what the artist had in view was an incident in the history of CYPSELUS. The subjects on the upper part were also obscure. They were taken to mean ULYSSES and CIRCE, the death of PATROCLUS, and VULCAN giving armour to THETIS. A centaur was seen with forefeet like a man's. There were also winged horses; and HERCULES, as well as NAUSICAA, were connected with the scene.

PAUSANIAS found objects in the temple which were deserving of notice. There was a small bedstead inlaid with ivory which was said to be a gift from HIPPODAMIA, the queen of Elis. A table of gold and ivory was used to support the crowns of victors. On a quoit which belonged to IPHITUS, a king of Elis, were inscribed the rules of the Olympian contests. Another series of rules was to be found in a secluded part of the temple. Statues of ZEUS, HERA, APOLLO, DIANA and the Mother of the Gods and other divinities were among the ornaments of the interior. PAUSANIAS was informed that on one occasion, when repairs of the Temple of Hera were necessary, the dead body of an armed soldier was found under the tiles of the roof. He was placed there as a vantage point when the Spartans had fought their way within the enclosure of the temples. Their arrows were well directed, for he died of his wounds and was forgotten. PAUSANIAS believed the body was preserved because in such a place the air remained unchanged.

The Temple of the Mother of the Gods was near to the Heraion. It was smaller in size but was also Doric in style. PAUSANIAS was doubtful about the dedication, for he found the temple was without a statue of the mysterious deity. The only figures it contained were those of Roman emperors, a circumstance which indicates the change which time and war had brought about. There were no other temples within the Altis enclosure. The statues were, however, numerous. Gods, emperors, athletes appeared to be so much alike, PAUSANIAS found it necessary to be careful in describing them. ZEUS appears to have been the favourite of all parts of Greece. In one part six were found which were made of bronze, and the traveller was informed they were all made of the coins which were paid as fines by athletes who tried to cheat by evading the conditions. Receivers as well as donors of bribes were mulcted. Roguery must have been often practised, for several series of statues owed their origin to it.

If we relied on the description of PAUSANIAS it would not appear that HERA or JUNO received much worship from the Greeks. They believed that she fought for them at Troy, but it was mainly through offended vanity. Besides Olympia, the only temple of the goddess which PAUSANIAS visited was that of Argos. According to him the columns were sculptured with such scenes as the Birth of ZEUS, the Combat of Gods and Giants, the Fall of ILION. In front of the temple were statues of priestesses. Within the temple was a bed used by the goddess, and what was of far more importance an enthroned figure of HERA by POLYCLETES. On her coronet the hours and graces were represented; in one hand was a sceptre, and in the other a pomegranate. Next it was a column supporting a more ancient statue of the goddess. There was a third statue of a more primitive kind. Among other objects were an altar of silver on which the Marriage of HERCULES and HEBE appeared in bas-relief, and a peacock of gold enriched with precious stones—a gift from the Emperor HADRIAN—besides a golden crown and purple veil which were presented by the Emperor NERO.

The inventory which PAUSANIAS furnishes of the Olympian temple and that of Argos can be considered as typical of the contents of many other interiors. They were museums and art galleries. Objects which had legends connected with deities were honoured, although the evidence concerning them was baseless. Statues in course of time rivalled in interest the more ancient and rude attempts at carving. All, however, formed part of a system which those who admire paganism in the abstract cannot have considered.

## THE LEGAL LIABILITY OF THE ARCHITECT

(Concluded from last week.)

### 2. In his Relation to the Contractor.

THE relations of the architect to the contractor are such that those he may maintain in his capacity as agent to the building owner, and as long as he acts within the limits of his authority he cannot incur any personal liability to the contractor. Even if he acts improperly or negligently in exercising his rightful authority, he is not liable to the contractor for any loss which may follow from his act. Where an architect was sued by a builder for negligently certifying for a much less sum than was properly payable to the builder, it was held that no action lay.\*

But directly an architect exceeds the authority conferred on him by the building owner and inflicts damage on the contractor, then the contractor can successfully maintain an action for damages against the architect. On the other hand, the contractor is a party to the building contract which defines the scope and limits of the authority conferred on the architect, and in order to succeed the contractor must be required to prove that he had been deceived as to the extension or alteration of the architect's authority, or the temporary or total removal of the limiting clauses of which he had such undoubted notice.

The architect, in such a case, is liable to be sued of course, for breach of contract, but for damages for breach of warranty of authority,† and, if so, it does not matter whether he did so exceed his authority innocently or with knowledge.

The architect is not liable to the contractor for a defect in his drawings and specification which may render them unpracticable, for he does not impliedly warrant practicability.‡ If he chooses to warrant them expressly in one capacity or another, then he would become liable should they fail in any capacity for which they have been warranted. Nor does he impliedly warrant any calculations or any estimates which he may compute when acting within the scope of his employment; but if the contractor based on these inaccurate calculations it is open to the contractor, if he exercise due diligence, to bring an action for the rescission of his contract, and in that case the architect incurs a liability to his client for any damages that thereupon accrue.

It must be remembered that there is no privity of contract between architect and builder; the architect is at all times a party to the building contract; and nothing short of an express undertaking by the architect can render him liable when acting within his authority, liable to the builder.

But if the architect commit a tort—that is to say, be guilty of a wrong to others—he may readily become liable to the contractor. If while a building is being erected injury occurs to the public, the contractor is suable and generally sued; but if the injury resulted from an act ordered by the architect, he in his turn becomes liable to the contractor, and if the architect had not exceeded his authority in ordering the act, the building owner would also be liable.§ Thus if a building in the course of construction, through defective planning, fell down upon a person and injured him, then an action would lie against the contractor by the person aggrieved, and against the architect by the contractor. If the employer, with notice, had authorised the defective planning, an action would lie against him. But the architect has no action against his principal; there is, indeed, no question of agency in tort: all persons who take part in the doing of a wrong are personally liable for the consequences of that wrong-doing. And in the event of an architect acting fraudulently towards the contractor he would be liable to an action of deceit, whether his employer had been a party to the act or not.

### 3. In his Relation to Public Authorities.

The obligation on the architect to know where he comes into contact with the practice of his profession exposes him to a liability to public authorities as well as to his client. With certain exceptions, his relationship to public authorities is not different from his relationship to private individuals, and it will be shown later that in these he may readily contract serious liability.

There is, however, a special liability to public authorities; but it is not of a general or onerous nature, because the various Building Acts do not impose their penal clauses

\* Stevenson v. Watson (1879), 4 C.P.D., 148.

† Richardson v. Williamson and Lawson (1870), L.R. 6 Q.B. 276.

‡ Thorn v. Mayor of London (1874), L.R. 9 Ex., 163.

§ Jolliffe v. Woodhouse (1894), 10 T.L.R., 553.

on the architect, but upon the builder or the occupier or owner. Still, the architect remains liable to public authorities and bodies for any fraud or trespass or negligence which he may commit to their detriment, and under & 53 Vict. c. 69 (Public Bodies Corrupt Practices Act, 1899), he is specially liable for any corruption when holding office under a public body. Again, & 38 & 39 Vict. c. 55 (Public Health Act, 1875) and its amending Acts; & 57 Vict. c. 73 (Local Government Act, 1894) and many other Acts impose on architects liability to penal actions for corrupt practices.

On the other hand, when employed by a public body, he may escape a liability which would remain upon him if employed by a private individual. Thus, it is a good defence for an architect when so employed to set up that he has acted in accordance with the statute under which the public body was at the time acting, and done or made bona-fide, or may have a simpler defence in the fact that the statute under which the public body was acting includes a clause rendering these acts legal.\* The latter defence is also open to the architect when acting for a private employer.†

#### 4. In his Relation to Adjoining Owners and others.

The architect will be liable in damages to adjoining owners and others whenever they suffer injury or damage from his acts or from acts authorised by him or from acts which are done in an improper manner authorised by him. These acts are generally connected with trespass—such as the building upon a stranger's land, and damage to redempible minerals; or they arise out of the perpetration of a nuisance—such as interference with a right-of-way or a right to water, air, light, or support; or they are due to negligence on the part of the architect or on the part of those authorised by him to do or leave undone certain acts.

If an architect through failure to make proper inquiries, or failure to put the building owner himself upon inquiry, should inadvertently place his building or a portion of it on an adjoining owner's land, he at once becomes liable to that adjoining owner in an action for damages on account of trespass, and, as stated above,‡ he renders his employer liable to have the building appropriated or destroyed by the adjoining owner or to an action for damages by him; and the architect further becomes liable to an action by his client. Trespass may be of the slightest character to become actionable: the driving of a nail, for example, into another person's wall.§ And consequently it is of importance that the architect should act warily when he is likely to commit an invasion of a definite corporeal right of property, and should remember that it is not necessary, to support an action of trespass, to allege any actual damage. That the damage is trifling is no defence, and the trespasser cannot shield himself behind the old legal maxim, "De minimis curat lex." And although in certain cases and for certain purposes a person may have a licence given by law to enter upon another's land, yet if that person subsequently misuses his right as to abuse it, then he becomes liable for his actions, and his entry is converted into a trespass which dates back to his original entry on the land. The subsequent act is held to show the intention with which he originally entered.||

So with the interference of rights enjoyed by other persons. Here again the old legal maxim, "Sic utere tuo ut alienum non lædas," applies specially to the architect. He must do nothing on the site upon which he is building which may damage those outside it. Whatever he brings on—such as water or solid substances—he must keep it at his peril. If water come there unhelped by him he is not bound to keep it in, but he may not, except at his expense, use any means to send it away.¶ He is, in fact, responsible, together with all other persons who assist or contribute, for any damage arising from water, filth, fire or any noxious thing which he has caused or allowed to pass on his land on to another's; for any damage to another's land or to support caused by the excavation of his own site; or any damage arising from the improper use of a natural stream—he may not even bank his land against the ordinary

flooding of a stream if this shall send more water on his neighbour's land;\* and for any interference with or obstruction of every kind of easement and profit à prendre.

The architect, however, can limit his liability in this respect by showing that his breach of any duty imposed on him by law is really due to the act of God, the king's enemies or some other kinds of *vis major*. An act of God is due to natural causes directly and exclusively, without human intervention, and such that it could not have been prevented by any amount of foresight and pains and care reasonably to be expected,† and it belongs to that class of casualty which is occasioned by the elementary forces of nature, e.g. earthquake, storm, flood, lightning, but not fire unless caused by lightning. The king's enemies means foreign enemies, and they are included because the person is in law liable for the wrong committed no default and has no remedy over against those who did the wrong. And other *vis major* would include an inevitable accident in respect of which the person ordinarily liable would have no remedy over. Thus, where the rain water from a roof was collected by gutters into a box and a rat gnawed a hole in the box and without any negligence of the defendant the rain water flowed through the hole and flooded the premises of the plaintiff, it was held that the accident amounted to *vis major*.

So, too, with negligence. What is negligence? The late Baron Alderson held that it is an omission to do something which a reasonable man, guided upon those considerations which ordinarily regulate the conduct of human affairs, would do; or doing something which a prudent and reasonable man would not do.‡ But mere omission is not actionable unless a duty is imposed on the person omitting. Responsibility and obligation must precede it; and the damage arising from it must be proximate and flow directly from it. Given these, the absence of due care constitutes legal negligence and may be expressed in damages and other remedies.

Thus, if an architect designs without due care a building which wholly or partially falls down and injures a passer-by, the architect is liable to an action for damages for his tort or wrong; if he lowers or raises a weight, the duty is cast upon him to take all reasonable care, whether he does so above a public road or private ground, as long as he knows or should know that persons may be passing below; but, on the other hand, it has been held that a person pulling down his own house (and similarly an architect when superintending the work) is under no duty to take care as to the owner of a modern adjoining house.§

All these liabilities may and often do arise in connection not only with private persons, but, as has been shown, in connection also with ownership or occupation by companies, corporations, public bodies and public authorities. Similarly, the liability is not confined to the architect, but extends to all and every person concerned in doing the wrong; and as a rule, action is taken against the building owner or the contractor, rather than against the architect.

Further liability attaches to the architect in respect of any frauds committed by him, either singly or in conjunction with others; or in respect of libel, slander, malicious prosecution and other wrongs; and, obviously, of course, in respect of any offence, misdemeanour or felony which he, either singly or associated with others, may commit. But the view taken here of the legal liability of the architect does not include liabilities which do not properly arise within the practice of his profession, and as a consequence these more serious matters may well be left untreated.

#### 5. As Valuer and Arbitrator.

There remains the liability of the architect as valuer or as dispute-preventer or as arbitrator or quasi-arbitrator.

The distinction between valuation and arbitration or quasi-arbitration is, briefly, the difference between a process which reaches a decision by the exercise of special knowledge and skill, and a proceeding which reaches a decision on the balance of evidence tendered at an inquiry. The former process is of the nature of an appraisal and the latter has that of a judicial proceeding. In building contracts the former is intended to prevent disputes arising, and the latter to settle them when they have arisen.

The question of the architect's liability as a valuer depends upon the facts of the case. If he has contracted

‡ Blyth v. Birmingham Waterworks Co. (1856), 11 Ex., 784.

§ Chadwick v. Trower (1839), 6 Bing. N.C., 1.

to value and this duty is not separable from his position as architect, or is separable from his judicial position as quasi-arbitrator or arbitrator, then he becomes liable to his client for any want of knowledge, care or skill which he may display.\* He undertook for reward that he was competent to discharge this duty and it is for the breach of this undertaking that he is liable to be sued. As valuer, too, he is obliged to take out an annual license costing 2*l.*, renewable on July 6 in each year, and the penal clause of the Inland Revenue Regulation Act† prescribes a forfeiture of 50*l.* for appraising or valuing without such license. A valuation by an unlicensed valuer has no force.

But an architect may act as a valuer in a judicial sense, and as such no liability save for fraud, collusion and the like would attach to his valuation. If the building contract constituted him a valuer for the purpose of determining a question between two or more parties—such, for example, as the quality of materials or work, or the amount of money due to the contractor—he is a valuer in a judicial sense, and is not liable for any want of knowledge, care or skill which he may display. He is really, as quasi-arbitrator, acting for both parties, and Chief Baron Kelly held, in *Pappa v. Rose*,‡ that it is for the parties themselves to see that the person in whose judgment they confide shall possess the requisite skill to exercise it properly. If, however, while giving his certificate upon his valuation as to the amount of money due to the builder, the architect should act negligently, the building owner is not necessarily concluded from proceeding against the architect for his negligence.§ In the case of *Rogers v. James*, it was contended that the architect could not be held liable for negligence when acting as arbitrator, but it was decided that under the building contract in question his decision was only final as between the building owner and the builder and that the building owner was not stopped from proceeding against the architect. The clause under which the architect acted as arbitrator gave him no power to bind the building owner as against himself.

A dispute-preventer may or may not be an arbitrator. If his function is to decide a question by the use of his own knowledge and skill, he is not an arbitrator: if he is asked to decide by holding an inquiry and basing his decision on the facts then brought to his notice, he is an arbitrator. In building contracts, however, his duty is not to determine disputes, but to prevent them arising, and in that capacity he is a valuer. As Lord Esher held in a well-known case,|| “If a man is, on account of his skill in such matters, appointed to make a valuation in such a manner that in making it he may, in accordance with the appointment, decide solely by the use of his eyes, his knowledge and his skill, he is not acting judicially; he is using the skill of a valuer, not of a judge. In the same way, if two persons are appointed for a similar purpose they are not arbitrators, but only valuers.” And the same great lawyer held that where a person is appointed to ascertain some matter for the purpose of preventing differences from arising—not of settling them when they have arisen—it is a case of a mere valuation.¶ If in such a case he holds himself out as a valuer, he is liable for any ignorance, negligence, or want of skill he may show; if he is selected by both parties to act as valuer on account of the confidence they repose in his knowledge or judgment, he is not responsible, except for fraud and the like, to either—they must abide by their choice; but if he is an arbitrator and his appointment is wide enough, he is liable for nothing but fraud, collusion, corruption, partiality and the like misconduct.

An arbitrator is liable to be removed if he has been guilty of misconduct which would be ground for setting aside his award when made. Such misconduct would include fraud, corruption, partiality and any circumstance which would be inconsistent with judicial impartiality. If he act honestly no action will lie against him for want of care or skill or negligence.

#### 6. The Duration of Liability.

The liability of the architect does not cease with the completion of the contract he has been employed to super-

intend. Under the Statute of Limitations\* he remains liable for negligence for the full term of six years from the date of the act of negligence, and he has been held liable even though the damage had not yet accrued. Obviously the discovery of a defect in a building may greatly postpone, but, nevertheless, this fact does not extend the duration of the architect's liability. Nor does the fact that an architect is appointed by the contract to be sole judge and arbitrator in all questions of dispute, that he decides any given question, conclude the building owner from an action against the architect on that question, though such decision may be and is final as regards the builder.†

In the case of trespass by or authorised by the architect, such, for example, as an excavation under an adjoining house—the Statute of Limitations would run not from the date of the trespass, but for six years from the occurrence of any damage. It was held in *Mitchell v. Darley Main Colliery Co.*‡ that each successive subsidence gives a fresh cause of action. Lord Bowen pointed out in that case that a fresh action may be brought as each fresh subsidence occurs, although the successive subsidences are due to the same excavation; for when the excavation has once been made and the adjoining land is kept in an unsupported state, there is “not merely an original act the results of which remain, but a state of things continued.”§

It should be added that the architect's liability is much reduced in point of time should he be superintending work under a public authority. The Public Authorities Protection Act of 1893,|| enacts that an action, prosecution or proceeding shall not lie or be instituted “unless it is commenced within six months next after the act, neglect or default complained of, or, in case of a continuance of injury or damage, within six months next after the ceasing thereof.” It was held in *Crumbie v. Wallsend Local Board*,¶ with reference to a somewhat similar but less precise provision in the Public Health Act of 1875,\*\* that on the authority of *Darley Main Colliery Co. v. Mitchell* (see *supra*) a further subsidence which took place within the six months before action constituted a distinct cause of action in respect of which the action was maintainable, and this led to the repealing of the section in question, and to the substitution of the more definite clause in the Public Authorities Protection Act of 1893. But while this limits the liability of the architect in the great majority of cases to a period of six months, it still leaves, in certain cases, a liability for a longer and, in one instance at least, an indeterminate period.

#### CHINESE HOUSES.

THE following report on the construction and equipment of houses in China has been sent by Consul W. Gracey, of Tsingtau:—

The Chinese get along with very little and have few desires, especially when it comes to a house to live in. It must be admitted that the native architects can put up solid and to a certain extent beautiful structures, but these are the rare exception and not the rule. The dwellings are generally primitive and not durable. The Chinese do not understand the building of arches. The most they attempt is a simple arch in bridges or doors, but even here it is necessary for them to first erect a mud-brick support for the arch, the former being torn away when the latter is completed. The great mistake made in walls is the poor binding between the outside layers, there often being hollow spaces in the middle which are only filled with loose dirt or crushed rock if they are filled at all. When rains this interior filling gets wet, it settles, and the wall wedges apart at the bottom. It thus often happens that the outer walls of a house collapse, while the inner ones which have not been wet, remain standing. The usual preventative for collapsing houses is to rest the beams and roof timbers on wooden posts, which are built into the wall and completely surrounded by the masonry. Thus when the walls give way these pillars hold up the roof and keep the whole house from coming down on the occupants.

case of two-storey buildings these wooden frameworks always built before the masonry work is started. The of mortar is also very faulty. The commonly used tar consists of finely slaked lime, with no addition tever of quartz sand, but for cases of economy the lime ten adulterated with very fine river sand.

The mason tests the soundness of every brick by hitting ith his knife-shaped trowel, and, like every Oriental esman, works slowly. Where stones are used, they are ys fitted into proper place on the outside and are ight to rest in the proper place by having little stones underneath them. As in the case of a mud wall, the w part between the two outside layers is filled with e chips. Only the outside edges are filled with mortar, the danger of collapsing in time is always present. houses of burnt brick are usually not found in the try, but in the cities and larger market villages, because the wealthy can afford them. The great masses are ent in stable-looking dwellings, whose floor is the earth, se walls are mud, and whose roofs are straw. The l house is divided into three equal parts by two beams sing it horizontally on top of the masonry walls. In the of houses with straw roofs, a light framework is ed on these beams. To protect the roof from wind, it ten weighted down with large stones.

n the great plains the farmhouses are made entirely of with flat roofs. Here the crossbeams rest on two n dividing beams. On top of this is placed a layer of hum straw, and that is then covered over with loess. i roofs need yearly renewing. They are built so that can be used to defend the farms, the walls being some t higher than the roof, so in time of need the men can n to them armed, and thus fight from a sort of parapet. use the rains are very disastrous to these walls, they often strengthened with a layer of tiles on the outside. difficulty with this construction is that the inner mud gives way and collapses when it gets wet, leaving only thin outer tile part standing. This usually results in wing the entire weight of the heavy roof on the light construction, and the whole house collapses. Many of e flat-roofed mud houses are destroyed during every , and whenever the rivers overflow the valleys practi- every house is ruined. There are no building laws or e regulations in China tending to better the class of es now constructed and thus make living in them e safe.

t will be seen that the only opportunity manufacturers e for the sale of building materials and hardware for use ng the Chinese is in supplying the cheapest quality of is. The articles which always command a sale are p iron hinges, locks, screws, nails, bolts and corrugated roofing, which is now being used for the better class of es, store-rooms, &c. Wire mosquito netting is also ing into more general use. All of these goods must, ever, be of the cheapest quality irrespective of strength, almost all of the goods mentioned find a sale because can be manufactured more cheaply by machinery than and labour, even where the wages of blacksmiths are about 10 cents a day.

Modern sanitation has been recently introduced into gtau, and buildings both old and new are being fitted ith bath-room furnishings of the latest patterns. The s dealing in these goods are entirely German and are rally inclined to use German goods. British manu- red wares are, however, found on the market and find od sale. Chinaware closets of British and German ufacture retail on this market at approximately 15 dols plete with washer and connections. Wall urinals cost 3 dols. to 7 dols., while those used in the public places anufactured entirely of enamelled ware and are much per. Bath tubs are used generally and cost 20 dols. zinc, 39 dols. for cast-iron enamelled and 45 dols. for t steel enamelled; washstands at 4 dols. to 16 dols.

The Germans manufacture an arrangement for rapidly ing water for bath-rooms. These consist of large ght tanks a foot in diameter, under which is a small e, the water being connected in the usual way from e pipes. These tanks need only one or two small els full of coal, and will keep burning for an hour, ing sufficient hot water for two or even three baths. r using one tank full of water it is merely refilled and in a few moments is ready for a second bath. These used in every house in Tsingtau, and could be well duced with a little energy in the other ports of China e running water is not used. The article costs at 1 40 dols. to 50 dols.

During the year 1906 stoves and grates were imported into China to the value of 178,402 taels (1 tael=83 cents), the largest portion of which, a value of 131,887 taels, coming from Germany. These stoves are used almost entirely by the European and other foreign residents of China, and only to a small extent by the Chinese natives. Small heating stoves are, however, gradually coming into use among the Chinese, and as coal becomes more plentiful throughout China there is every possibility that there will be a greatly increased call for these goods. The class of heating stoves used by the natives themselves are locally-produced brick structures built in the shape of a bed, and known as a "kang." A fire is built under this and serves to keep the family partially warm when they sit or recline upon it. Charcoal braziers are also used in the better class houses, and a small charcoal brazier enclosed in a basket is worn under the clothing by the natives, suspended from the waist, and carried around with them wherever they may go. The better class of Chinese are now taking to the use of foreign stoves, generally of the type known as direct-draft surface burners, which sell at retail on the Shanghai market at about 7 dols. 50 cents each. Cheaper imitations can be obtained for about 3 dols. or 4 dols. The larger stoves sell at higher prices, and are finding a sale among the Chinese wishing to secure a better class of article. The German stoves sell on the Tsingtau market at the following prices:—Basket shaped, first quality, from 2 dols. 25 cents to 4 dols. each; second quality, from 1 dol. 70 cents to 3 dols. each; upright shaped, first quality, from 6 dols. to 15 dols. each; second quality, from 5 dols. to 10 dols. each; third quality, from 4 dols. to 7 dols. 50 cents each; fourth quality, from 2 dols. 50 cents to 4 dols. 50 cents each. The demand is for cheap stoves, and the German makes appear to have preference over those of American manufacture from the fact that they use a smaller quantity of fuel. Fancy stoves would naturally command a better sale, but they are too expensive for the Chinese people.

#### CHURCH BUILDING.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held a meeting on the 19th inst. at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money varying in amount from 200*l.* to 10*l.* were made towards the building, enlarging or otherwise improving the accommodation of several churches. In addition to this the sum of 336*l.* was paid towards the repairs of nine churches from trust funds held by the Society. In the multitude of other claims it is a matter of regret that the Incorporated Church Building Society should be overlooked. At this season especially, when Christian charity is generally more widely dispensed than usual, it is earnestly hoped that attention may be directed, and that successfully, to the large work that is being carried on by the committee and the very much larger work that might be done if Churchmen would contribute more liberally to its funds.

"Cowper's House," a large, red-brick mansion at the east corner of Olney market place, Northamptonshire, underwent many regrettable alterations in the course of the last century. The year 1892 saw the chief "restoration," when the bluest of slates replaced the old-fashioned red tiles, which are now, it is said, in the United States, roofing a replica of the poet's old home. The trustees of the house had for long under consideration the project of altering the house to give it again as far as possible its eighteenth-century look. The work was begun some six months ago, under the direction of Mr. Alexander Anderson, architect, Northampton, and is now completed. The restoration, while not extensive, has been done with care and reverence. It concerns almost exclusively the exterior. The cement patching has been replaced by stone, matching the original stonework. The original side piers have been restored to their condition in Cowper's time, as far as can be judged from the numerous old prints which Mr. Anderson studied on undertaking the work. His only recommendation which the trustees did not adopt was that tiles take the place of the slate roof. The builder concerned was Mr. W. Revitt, of Olney.

## NOTES AND COMMENTS.

A MEMORIAL of the late Empress of AUSTRIA, who was murdered at Geneva, is to be erected in Trieste. Designs are sought in competition, and the character of the memorial is left to those who take part. The only condition that is specified is that there must be a bust in bronze of the Empress, which is to be cast in Austria. The outlay is to be about 80,000 crowns. There will be two competitions. The first designs are to be sent in before March 1, 1908, and the scale must be one-tenth full size. They are to be signed with a device, and the name of the artist is to be enclosed in an envelope bearing the same device on the outside. The jury of five will be composed of three sculptors who are professors of the Academy of Fine Arts in Vienna, the director of the Industrial School at Trieste, and M. PULGHER DOMENICO, architect, of Trieste. They will select three designs, and the artists will prepare others at a scale of one-fifth full size before June 15, 1908. The second designs will become the property of the committee, and each of the authors will receive 1,000 crowns. The design selected may be modified according to suggestions derived from the other projects. The secretary is M. LUIGI DE BERNETICH TOMMASINI, Trieste.

LOYALTY is strong in Scotland, and this may explain the desire to have the two offices of King's Limner and King's Sculptor, which are now vacant, filled by artists duly appointed. The Limner's office goes back to the time of JAMES VI., when ARNOLD BRONKHORST secured the dignity. His name is not, however, mentioned by WALPOLE. In 1700 the position was held by a shopkeeper and in 1739 by an infantry captain. At a more recent time GEORGE IV. was anxious to uphold old offices. When he visited Edinburgh in 1822 HENRY RAE BURN was made one of the knights, and in the following year became His Majesty's Limner. Sir DAVID also received the title. In 1841 DAVID ALLAN succeeded to the office of Limner to the Queen, and was knighted. In 1850 the holder was Sir JOHN WATSON GORDON. The last Limner was Sir NOEL PATON. Apparently there has been only one Sculptor for Scotland, Sir JOHN STEELL, and the office has been vacant since his death in 1891. The appointments would be pleasing to the people of Scotland as well as to two artists, and as the emoluments are very modest, they would not cast much of a burden on taxpayers.

It appears that the Paris Municipal Council intend to erect at the Franco-British exhibition a pavilion in which it is contemplated to display objects of historical interest connected with the city of Paris, together with plans, models and literature of municipal work and improvement undertaken by the Municipal Council. They have suggested that the London County Council should erect a similar pavilion. The project has been considered by a sub-committee of the Council who have submitted a design of a pavilion, together with a list of objects which might form the exhibit to be displayed therein, the total estimated cost being 8,000/. Having regard to the expense involved, the general purposes committee announced that they were not prepared to recommend the Council to adopt the proposal, and directed that the executive committee of the exhibition should be so informed. The sum mentioned would not largely increase the debt of the Metropolis, and the educational advantages derived from it might be worth the expenditure. Evidently the Paris Municipal Council are eager to display evidence of the system which is adopted in the administration of Paris. To some extent it would be possible for the London County Council to exhibit plans, models, diagrams, apparatus which would compare favourably with those produced in Paris, and

in some of them London could claim superiority. certain shortcomings of our Metropolis would be manifest, and in that way questions would arise whether reforms might not be introduced. The elected authorities of both cities are fond of making visits with the purpose of investigating institutions. The two pavilions would serve to impart similar lessons to those who supply the money in both capitals. That end is likely to be attained, for the general purposes committee have withdrawn their opposition in deference to the majority of the Council.

## ILLUSTRATIONS.

THE HENRY BRASS MEMORIAL CHURCH, LONDON ROAD, REDHILL, SURREY.

THIS design was submitted for competition open to local architects as a memorial to the late HENRY BRASS, of Redhill, and was one of three selected by the assessor, Mr. W. H. SETH-SMITH, F.R.I.B.A., for final adjudication. In the conditions the committee desired accommodation for 650 people at a cost of £6,668/-. The design proposed that the church be built of brick with stone dressings and tiled roof. The design is based on the English Perpendicular Gothic. The materials for the exterior are red bricks with weathered and undercut joints, with dressings of Weldon stone. The roof tiled and the doors in oak. Internally, the stones and dressings in Ham Hill stone, roof timber in pitch-pine left clean from plane and chisel, wall-panels in oak, flooring of pitch-pine, those to passages of hard wood or tiles, floor of chancel tile or marble. Heating by low-pressure hot-water system. The estimated cost of the building as given by a qualified quantity surveyor was 6,668/-. for a seating accommodation for 658, and this sum excluded the upper part of the tower, which the committee propose to leave for the present.

ADDITION TO HOSPITAL, GRAVESEND.

ALMSHOUSES, GRAVESEND.

NORWOOD, HUDDERSFIELD: THE HALL.

THIS house occupies a very fine position on high ground in a well-timbered park; the exterior is faced with York stone; the roofs are tiled with Broseley tiles. The hall is panelled to a height of 10 feet with oak, with a carved mantel and overmantel, the ceiling being divided into panels by oak beams carried by fluted pilasters. The dining-room is also oak panelled with oak mantelpiece, the ceiling of fibrous plaster with projecting oak beams. The morning-room has mahogany dado, screens, bookcases and mantelpiece, with plain ceiling and enriched cornice. All the woodwork in drawing-room is finished with white enamel, the inglenook, ceiling and decorative work being in fibrous plaster, all finished white. The woodwork in billiard-room, including screen and mantel, is of fumigated oak; the ceiling, which is arched, is of fibrous plaster, divided into panels by oak ribs carried on brackets. The staircase is of oak. Mrs. KAYE's bedroom has specially designed fittings all in inlaid mahogany. The floors of all reception-rooms and hall are of solid oak parquet. The vestibule, loggia and conservatory have all marble mosaic pavings. The whole of the walling was carried out by Messrs. MALLINSON & SONS and Mr. BOTTOMLEY, the carpenter's work being done by the estate workmen. Messrs. BURT & POTTS supplied the iron casements. The whole of the work was designed and carried out under the superintendence of Mr. J. HATCHARD SMITH, F.R.I.B.A., of 41 Finsbury Pavement, E.C.

MYHOLME, MERRY HILL ROAD, BUSHEY.

## THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. Walter Bagehot, president, in the chair.

It was announced that the annual dinner of the Camera Pictograph Club would be held at the Café Monico on Monday, January 23rd.

J. R. Young, of Belfast, was elected a member. On the motion of the President, votes of thanks were given to Mr. Hugh Stannus for a donation of pencil portraits of Wren made by him in 1878, and to Mr. H. F. Waring for a water-colour drawing of a portion of Hampton Court.

FRANK KNIGHT read the following paper, illustrated by lantern slides, written by Mr. Arthur Keen, who was invited to attend:—

## Sir C. Wren's City of London Churches.

The buildings I want to discuss this evening are the ones built in the Classic manner by Sir Christopher Wren in the City of London, and I may say at the outset propose to look at them entirely from the architectural point of view, and not from the archaeological. An interesting paper was read here lately by Mr. Oliver, in which a great deal of information was given about the ancient history of the streets and ecclesiastical establishments of London, and I propose to consider the buildings as matters of

fact, and not of the chief considerations I had in mind in choosing this subject. The fact was that these churches, which ought to be preserved by all as one of the chief glories of London, are year by year getting fewer in number, and as I take it that the only way to check the destruction is to develop and educate the body of public opinion, I feel that every architect should do what he can to influence general opinion and help the public realise how great and irreparable is the loss that is taking place.

Wren built forty-nine churches in the City besides repairing or adding to others, and at the present time eighteen have disappeared, three having been destroyed within the last few years. This year the church of St. Peter le Poer, a true, built by Wren, has been sold and demolished; although it was not a fine church, its loss is to be regretted because it was the only instance in London, as far as I know, of a church lighted entirely from the top. It was a regular church with a domed ceiling springing off a circular cornice, and having a circular eye at the top with light coming over it. The light was beautifully diffused and the interior was altogether good.

I call attention to the City Churches' Preservation Society, of which my friend, Mr. A. E. Moore, is the secretary, as a useful agency, and one that all of us should join? There is no subscription, and meetings are held, I believe, only when particular occasion requires. The intention is to have a good list of names of persons interested in the matter, so as to be able to bring pressure to bear when it is required. The Society has been instrumental in saving St. Mildred's, All Hallows, Bread Street, and St. Mary Woolnoth, and it ought to have long support from our profession when, if ever, churches are threatened. The secretary's address is 11, Abchurch Lane.

It is well known that Wren's churches were built on the sites and often on the actual foundations of the old Gothic churches—such churches, for instance, as St. Dunstons, Hart Street; St. Helen's or St. Giles's, Cripplegate; and the few that survived the Fire—and this fact adds to the greater prominence of the wonderful power of Wren's displayed by the architect. His work was that of a new departure entirely. For, although the Classic manner had become general by his time—as evidenced by such work as the old street fronts at Green, dated 1658, treated with brick pilasters and a classic cornice—it must be remembered that the first St. Catherine Cree, built by his immediate predecessor, Inigo Jones, was in all essentials a Gothic church, even such Gothic work as the fan tracery vaulting of the staircase of Christ Church, Oxford, was possible in Charles I.'s reign (1640).

A great point that strikes one is that all these churches, new and original as they were, show no uncertainty or hesitation, and the variety of types that they are quite extraordinary, whatever standpoint they are judged from. Wren was a scholarly man and an original thinker in all departments of his work and study. The distinction in all branches of science as it was

understood in those days; so much so that Evelyn spoke of him as "that rare and early prodigy of universal science." But his versatility and imagination are shown even more in the variety and originality of his City of London churches. Here is a view of an old London Gothic church, All Hallows, Barking; here, a plan of another, St. Olave's, Hart Street. Here is Inigo Jones's church, which you will see is still a Gothic building expressed more or less in Classic language, and here is one of Wren's first efforts—the church of St. Mary-le-Bow, 1671 (exterior, detail, and interior).

Of course, it has to be remembered that Wren went to France the year before the Fire of London, and saw work by Bernini and other Classic men; but his originality is remarkable enough even in face of this. And it may be pointed out that the building in Paris that is most like Wren's work—the Hôtel des Invalides—was not begun until five years after Wren's visit, and neither St. Sulpice nor the Panthéon was built.

Now as to the scheme or general arrangement of the churches regarded as interiors rather than exteriors. They comprise buildings of all sizes from about 76 feet by 40 feet (St. Matthew, Friday Street) up to about 144 feet by 90 feet (Christ Church, Newgate), and many types of plan from the simple oblong without a column or recess up to the full three-aisled example like St. Peter's, Cornhill, or the many-columned St. Stephen's, Walbrook—some with galleries, some without, and some with chancels more or less after the Gothic fashion, but mostly without. Wren had a fine feeling for the difference in scale that exists between Gothic and Classic design, and he seems to have felt instinctively that the effect of length and comparative narrowness given by a Gothic interior was out of harmony with the bigness of treatment required by the "good Roman manner" in which he worked, and therefore he generally threw the whole space into the general scheme in preference to treating the chancel as an adjunct or a separate feature. Take such a church as St. Anne and St. Agnes to exemplify this. It is only 53 feet square inside, but if treated after the Gothic fashion it would no doubt have had its nave and aisles and chancel with their arcading and chancel arch, clerestory windows, buttresses, open timber roof and other accessories. Instead of this it has merely four columns and two great barrel-vaults intersecting over a central square, and the result is a fine, dignified architectural effect. Even when the building was large there was seldom a chancel or at most a mere square or shallow recess as at St. Bride's or St. James's Garlick Hythe.

The various churches may be divided into classes according to the arrangement of their ground plans, or by reference to the treatment of their vaulting—or rather of their ceilings—for as the vaults are formed in plaster they must, I suppose, be called ceilings.

Taking the ground plans first, it may be pointed out that there are hardly any instances where the tower enters into the architectural treatment of the interior; perhaps the only one left is St. Martin's, Ludgate Hill, and even there it forms merely one of a series of three great arched openings that occur along the south side of the church. Generally the tower is used either as an entrance lobby or vestry, and if it comes within the main walls of the church it shares with an organ recess, and perhaps a staircase, a strip taken off from the main area and having little connection with the design of the rest, as at St. Swithun's.

The simplest form of plan is that which shows in the interior a mere oblong without columns or recesses, such as St. Mildred's, Bread Street, or St. Nicholas Cole Abbey. Then there is a similar plan with the addition of a recess such as St. Clement, Eastcheap. Then the same form with a fully developed aisle like St. Margaret, Lothbury, or St. Vedast. And next, of course, the central nave and two aisles, either with or without clerestory windows—a good form of church where galleries are wanted, but treated very successfully by Wren in both ways. St. Andrew Wardrobe and St. Magnus the Martyr are good examples (or St. Bride's). Then we have the square or approximate square with an inside square formed of four columns; this is a very interesting class, and we shall have more to say about it later. And lastly, we get the domed church in various forms; the dome springing off the walls or off columns, or in the orthodox fashion by means of pendentives over the angles of a square or octagon. In this class I might call attention to the two churches of St. Benet Fink and St. Antholin. Neither of them remains for us to see, but the interiors of both must have been among the most delightful of Wren's works. Both had elliptical domes

standing on columns with an aisle running right round behind them. In St. Benet Fink there were six columns, and between each two was thrown an arch which ran back as a barrel-vault butting against the wall, and the four small corner spaces had flat ceilings. The dome was of a full high pitch with a central lantern for light, and the effect of support given to it by the transverse barrel vaults all round it must have been very marked. The barrel ceilings stood on a cornice and architrave from the column to the wall in each case, and the dome rose off a strongly marked cornice. The church stood where the Peabody Statue now stands, behind the Royal Exchange, and it was removed under an Act for "improving the approach to London Bridge," but as it stood in a street that runs in another direction, it is difficult to see how this purpose was served.

St. Antholin's, sold and destroyed in 1875 under the Union of Benefices Act to help to pay for two other churches, was similar to the last in the arrangement of its plan, but the dome was much larger and higher in proportion to the rest of the building, and the columns, instead of carrying arches and barrel-vaults, were finished with an entablature, from the cornice of which the dome started; and the aisles behind the columns had flat ceilings, with beams running from the columns to the angles. The dome had a rise of about 16 feet, and was lighted by four bull's-eye windows. Except as regards the shape of its plan and the fact that the columns were isolated, the treatment of the dome was very much like that of St. Swithun's, Cannon Street, and the general composition must have been very picturesque and interesting.

In all three classes there is endless change in the use of ordinary architectural forms: simple columns carrying entablatures, columns carrying arches, columns with arches between them, piers carrying galleries and running up to form a nave arcade, and other combinations.

Let us take St. Bride's as a very beautiful and fully-developed example, and one in which great attention has been given to details. It has a wide nave and aisles in five bays, and a central tower at the west end with a staircase on either side. The arcade is carried by coupled columns not quite separated from each other, and having a projecting pilaster on each side to support the gallery. Then comes a good strong entablature binding the columns together so as to form a good seating for the arcade, and immediately above the arcade springs the semicircular ceiling with circular clerestory windows breaking into it. The aisles have groined vaults springing at the same level as the nave arcade. The whole design is sound, sensible and obvious, and on the negative side there is nothing whatever to take exception to. On the other hand, however, we have every characteristic of a good design illustrated; beautiful proportion without any loss of freedom, fine broad effects of light and shade combined with good interesting detail, great judgment in the handling of such awkward features as the transverse arches that cut into the main vault, refinement and strength in every part, picturesqueness, in fact, all of the "essentials" that Mr. Belcher has dealt with in his book, and all attained with apparently the greatest ease. The manner in which the gallery fronts are carried and the treatment of their detail are quite admirable; the organ is a fine feature and splendidly placed.

The class consisting of four interior columns within the square of the external walls is interesting on account of the great diversity of treatment that the principle lends itself to. For instance, St. George's, Botolph Lane—now, most unhappily, destroyed—belonged really to the class of central nave and two aisles, because the columns carried a barrel-vault running from end to end of the building, with clerestory windows cut into it; and the spaces to north and south were actual aisles with flat ceilings over them.

St. Martin's, Ludgate Hill, on the other hand, forms two narrow-barrel vaults intersecting in the centre so as to form a cross. And St. Mary-at-Hill again becomes a central square covered by a dome on pendentives with arched recesses on the four sides and flat ceilings in the corners. The possible combinations arising out of such a plan are endless; with the interchanging of columns and piers, arches and entablatures, vaults, domes and flat ceilings, clerestories, wall lighting and lanterns; and when one considers how well adapted it is for congregational purposes (and particularly in Nonconformist churches) the plan is worth careful attention.

Of the domed plans the noblest, of course, is St. Stephen's, Walbrook, and one need never be weary of studying and admiring the skill on the one hand and the instinct for beauty on the other with which this interior is

managed. Among other things this church illustrates a characteristic that always appeals to me as a student and interesting one in Wren's interiors—I mean extreme picturesqueness. The freedom of treatment, breadth of light and shade, the boldness and dignity of the essential parts, and the general interest of the composition, together with the beauty of the carved and moulded work, the quaintness and charm of the old brass chandeliers and iron sword rests, the touches of gold on stucco plaster, all combine to produce delightful subjects for the painter.

St. Martin's, with its three great deep arches, beautiful columns and entablatures, is another good example, and St. Bride's is another. And the octagon dome of St. Swithun's until a year or two ago was another, decorated in a wonderful old grey-blue colour relieved and toned with gold in the happiest manner possible, but unfortunately disappeared a year or two ago in favour of a scheme of decoration about which I need not speak, to say that it has taken all the expression out of the face of the church, and made the dome look flat and uninteresting, instead of, as it was before, full pitched and vigorous.

It occurs to me to point out here one great element of difference between Wren's work and much of even the best of modern work, and one that I think is much in his favour. It is the way in which he treated walls in broad, unbroken surfaces. He made but little use of pilasters, engaged columns, panels, rusticated quoins, and other devices which wall surfaces are commonly "relieved" and decorated with nowadays. The Gothic revival, with its buttresses, ribs, its wall shafts and panelling, has left the modern architect with an uneasy feeling that every division of a building should be expressed on its outer wall, and every feature occurring high up should grow out of something below, so that many breaks and projections, ornamental details possessing very little reference to construction or even to intelligent design appear on the sides of their walls to the destruction of all broadness and dignity. In fact, the tendency is to over-design buildings, which is a thing that Sir Christopher Wren never did. He was content to leave a good thing alone without attempting to make it better; and none of his buildings give the impression that he regarded them as his last work, or perhaps his only chance of distinguishing himself.

Now as regards the design of the ceilings of churches: as I have said before, the buildings may be arranged in well-marked classes by taking the plan, forms and treatment of their ceilings as the basis of comparison, and it would not be difficult to deal with them. Viollet-le-Duc and many others have dealt with them, vaulting, showing a gradual evolution from the simplest types of flat and coved ceilings up to the complex, sculpturally-designed and admirably beautiful vaulted and domed ones, only this method would not in the present case be a historical one—that is to say, the simplest forms could be shown to be the earliest. For instance, St. Benet Fink (1673) with its domed ceiling, is earlier than St. Nicholas Cole Abbey (1677) with its flat one. However, looking at the matter as a question of design, there are many between such a treatment as that of St. Peter's, Cambridge, with its great barrel-vault over the nave and its transverse vaults over the aisles, and the flat ceiling with a cove which it that occurs in so many instances. The cove being large, it has vaults cutting into it, it becomes associated with regular groined vaults which cover recessed spaces. The barrel-vault is used in all kinds of ways; it runs uninterruptedly from end to end as at St. Peter's, Cambridge, it has arches cutting into it as at St. Mary-le-Bow, it is used in sections as at St. Anne and St. Agnes, it leads up to a dome as at St. Stephen's or St. Mildred's; and in all cases the architect has dealt with the particular form in the easy, unforced way of a master.

Let us start by accepting three leading classes—the flat ceiling, the vaulted ceiling and the dome. Of the first we have St. Nicholas Cole Abbey as a good example, the ceiling divided into panels by beams crossing each other. The walls are divided into five bays by flat piers carrying a big entablature, and the beams, of course, correspond with these pilasters. The west end of the church has three big arches, one into the tower and the other two containing the organ gallery, with pilasters between them, and the effect of these arches and the richly-detailed work of the doorways and organ seen in comparison with the simplicity of the interior generally is fine and impressive. Indeed, the whole church is interesting as an example of judicious and effective design, a fine interior produced

tively simple materials. Then we may take s's Garlick Hythe as an example of the flat ceiling ve round it, and this church shows the cove in its ghly-developed form, divided up into a series of openings over the window heads, and with barrel-ver the wide centre bay cutting into the cove and a sort of transepts. Mr. Birch, speaking of this n his book, regrets that the light is obscured by stained glass and by the decorative colours being but the church has now been redecorated and is tly light. I think the view we have of the interior at once that the composition would have been r if there had been no light at all in the aisles. very narrow, and a good, strong shadow in them ve been effective in itself and would have ved the transept effect of the wide central bays. ide of this church is very fine and would make a of drawings.

edast's Church, close to the General Post Office, is good example of a coved ceiling, and it has some modelled plasterwork in bold relief introduced in dings of the cove and the ceiling panelling. The t of the south side of the nave, with its simple columns and its broad wall surface above the arches, d lesson in strong, unaffected design. There is g very dignified and satisfying about it, and it is at a fine interior is marred by the east wall not right angles to the rest of the building. We have example of the fine effect resulting from a dark rasting with a well-lighted nave.

imilar treatment occurs in St. Clement's Church, e deep shadow and the organ standing in the centre ess mask the fact that the south wall is at an acute th the west. The present arrangement is not the one, but the gallery that formerly occupied the ould have had the same effect.

ost hesitate to offer St. Peter's, Cornhill, as an on of the type of church with a great unbroken ult from end to end of the nave, because the church recently decorated in such a way as to take much nity out of it, and to contradict the general lines of ae.

corator seems to have been actuated by the single eparating each particular detail from its surround- at every moulding and panel, archivolt, rib and a different colour from the ground on which it is d the architect's design is cut up into strips and f colour. One thing in particular that strikes the is that the large modelled wreaths applied to the rface of the vault by some error of judgment on of the plasterer, no doubt, are seen in their dis- ape with painful distinctness. They could easily e treated in such a way as to be hardly noticed, ecorator's principles seem to have been stronger judgment. However, leaving the pink and green v out of the question for a moment, we may call to the main features of the design of the building. ave and two aisles in five bays. The arcades have e piers and semicircular arches crowned by a fine Then comes a plinth with projecting dies to mark and then a fully-panelled and ribbed barrel-vault. gorous effect of support and strength is given by ng of the aisles—transverse barrel-vaults running n the arches of the arcade, and carried in their rches thrown from the piers to the aisle walls. ore direct or obvious could be imagined, and ore successful or satisfying. There is no light d in the ceiling of the nave, but the aisles have h windows, and there are numerous windows in vall, so that the interior is fully lighted. All the details of the church are good, the pulpit, the en, which runs right across the church, the organ allery it stands on, all are of the best kind, and church is a fine architectural conception, and an one for a modern designer to base his studies on. ry-le-Bow is an interior that approximates to the general treatment, but it has vaults cutting into barrel. St. James's, Piccadilly, of which we have though it is not in the City, is another.

very fine example of a three-aisled church with a el-ceiling over the nave, we may take St. Andrew e—in my judgment a fine interior in every way, d example of the use of galleries. Good, square led piers carry the gallery, and then run up as hite-panelled posts or columns of rather slender n to carry the vaulting. The transverse arch of

the groined vaults over the aisles runs through into the nave vault so as to form a kind of nave arcade, and the effect of it is extremely refined and interesting. These vaults are plain, but the one over the nave is richly decorated with surface panelling and ribs, and a certain well-judged emphasis is given to it by the nave projecting slightly beyond the aisles at both ends. There is a fine organ in a west gallery carried on Tuscan columns. The ceiling of this church is finished in dead white throughout, and it could be very much improved by a little coloured decoration. The lighting is done by a double range of windows in the north and south aisle walls, and a big east window.

Time will not allow us to examine the various churches with clerestory windows to the nave, and with endless inter-changing of entablatures and arcades, piers and columns, groining and flat ceilings, although there are many that are worth careful study. We will pass on to one or two views of churches on the four-column plan which will be interesting. The two churches of St. Anne and St. Agnes and St. Martin, Ludgate Hill, are both of them fine examples—one wide and low, and the other narrow and lofty—both of them with flat ceilings in the corners, and segmental vaults intersecting over the crossing. St. Anne's presents a fine dignified effect, combined with a certain homely picturesqueness that is very pleasing, and it is such a building as might well be adopted in the present day.

St. Martin's is a more architectural interior and a stately composition and a well-designed church in all aspects. The lighting of these churches is very satisfactory, and the contrast between the deep shadows in the corners and the light in the centre portions is a good feature in the design.

The other church of this kind that is left standing is St. Mary-at-Hill, Billingsgate. It is in the Greek cross plan in its purest form—that is to say, with a well-defined square in the centre covered by a dome on pendentives. When allowance is made for the use that this church is put to by the Church Army with its magic-lantern sheets, gramaphones, band, teacups, and other accessories of popular religion, it must be felt to be one of the most beautiful buildings in London. With the exception of the east front, the exterior does not call for notice; it was mostly rebuilt early in the nineteenth century, and it will be noticed at once that a great deal of work was done inside the church at the same time, the details of the vaulting being obviously later than Wren's time. They lack the boldness and ease of the earlier work, although they are sound and refined, and handled with a good feeling for scale. The width of the central aisles is but 24 feet, the whole church inside being but 61 feet wide, but the treatment of the few parts that form the composition makes it impressive and dignified. There is most beautiful joinerywork in the church, and some well-designed ironwork, and I hope it may one day form the subject of one of the Fletcher bursary drawings.

Before we come to the more elaborate of the domed churches there is one church to be mentioned as a kind of intermediate treatment, a very beautiful one, although quite small. This is St. Mildred's, Bread Street, already alluded to as having the simplest possible plan, but presenting a beautiful interior. It has a flat dome in the centre of its length, of the full width of the church, 36 feet, carried on four pendentives contained between four arches forming the central square; wall arches to the north and south, and actual vaults to the east and west, carried on corbels and arches so as to dispense with a continuous cornice—which would have been an awkward feature to deal with on account of the high windows. All the plasterwork treated in the usual bold, masterly fashion, effective, in spite of the doubtful light of the City, and contributing very well to the scale adopted. It may be pointed out that the freedom of the plaster detail in these churches of Wren's is very valuable in masking the irregular spacing and unequal angles that arise out of the awkward shape of the sites in many cases. In this particular church there are irregularities that are not readily found out except by careful study. The organ is in a fine west gallery, under which is the entrance vestibule screened off by beautiful panelling and Ionic columns. Almost everything in the church is interesting and well designed—pulpit, reredos, font, chandeliers and some good ironwork and wall tablets. The lead spire, too, is a good example.

The two domed churches of St. Swithun and St. Mary Abchurch are almost precisely similar in plan, a square with a tower outside it at one corner, and a recess the same depth with tower, but utterly different in the method of design adopted. Each has a column dividing the recess, and

at St. Swithun's the column is repeated by seven half-columns so as to form the corners of an octagon. Round the octagon is a rich entablature very fully detailed, and this entablature carries an octagon dome ribbed in the angles and panelled and decorated on all sides. The width of the octagon is 43 feet between the columns.

In the other church corbels in the form of capitals take the place of columns, and arches are formed between them with pendentives carrying a big circular cornice from which the dome springs, the dome and its pendentives forming a full hemisphere. The surface of the dome, as you probably all know very well, has painted decorations by Sir James Thornhill, representing the heavenly choir, but they have become so black that they can only be seen with great difficulty even on a sunny day, in spite of four windows in the dome, and a judicious cleaning would probably be well worth doing. The arches under the dome run back into the west recess in the form of barrel-vaults, and where the corners of the square occur a mitre is formed and the surface of the vault twisted and forced into forming an arch on each face of the square, in which a window is set. It is the kind of contrivance that we are accustomed to in Gothic vaulting, where the ribs run in true curves and the fillings twist themselves into any required shape; but we hardly expect to find it in the work of a great mathematician like Wren, and the appearance of it is more curious than beautiful. The work altogether is of the most haphazard and uncertain kind, and irregularities occur in all directions. Wren has been called the last of the Gothic architects—in consequence of his versatility and imagination in design—and the Gothic spirit shows itself also in the calm indifference shown here and in many other churches to the laws which govern the development and intersection of curves. In St. Mary Abchurch, again, the interior is full of beautiful things—the organ front is a fine one, and the font, with beautiful little figures of the Evangelists on its cover, is a gem of design.

With regard to St. Stephen's, Walbrook, we may certainly say it is one of the finest interiors in London, and most people must feel that there are few more perfect architectural compositions to be seen anywhere. The scheme of it consists, briefly, in a dome carried on an octagon of eight columns, and from four faces of the octagon run out the chancel, the nave and two transepts. Then four columns are added to form the octagon into a square below the entablature, and between these and the columns of the octagon run out aisles to the nave and chancel; then, in order that the dome may stand on disengaged columns instead of partly on columns and partly on pilasters, the north and south walls are kept a little distance from the aisle columns so as to form a second aisle each side. To my mind there are three things that detract to some extent from the success of the design—first, a certain weakness in the springing of the eight arches that carry the dome; second, the fact that the entablature stops where it reaches the walls, except at the west end, instead of running along them; and third, that the outer aisles are narrower than the inner ones. Mr. Penrose, by dint of industrious study, found well-defined proportions existing between the various dimensions of the building; but surely, if the site had been wider these outer aisles would have been allowed the benefit of it. It is no doubt ingenious to discover that certain proportions in a building are as four to seven and seven to ten, and so forth, but one has an uneasy feeling that they might equally well have been four to six and seven to nine, especially when it is remembered that the whole effect of proportion may be varied at once by the use of circular features instead of square ones, by difference in projections, by colour, by surface decoration and many other things. However, the aisles serve the main purpose that the designer must have had in view—of detaching the dome and its columns from the walls—and their narrowness is not a serious defect. The points of excellence in the design are too numerous to mention; the freshness of it, the skill in composition, the sense of strength and firmness given by the boldly-modelled entablature and the deep shadows behind it, the richness of the many columns, and the fine comparison between the elaboration of the dome and the simplicity of the vaults that lead up to it. Added to these are the richness and beauty of the organ, the pulpit, the font—which, again, has little carved standing figures on the oak cover of it—the reredos, and the panelling round the walls. And not the least of the good qualities of this church are the dignity and solemnity which suggest its purpose and intensify the influence of its service. It may be as well to

add that the present square bases of the columns are the original ones, but were formed in 1887, I believe, the authority of an old drawing of the interior, in the old octagonal ones. This was at the time when high pews were removed by Mr. Penrose and replaced by the present benches. Whether the change of seating such an advantage as is commonly thought is a question. I have heard it said by those who knew the church before the alteration that the proportions were better with the high pews, and I am disposed to think my view of the matter is correct.

There are many more churches to which I might have referred, and much more might be said about those I have described, but we have seen a fairly representative selection of them, and I hope sufficiently interesting ones to show that the churches of Sir Christopher Wren's are valuable and important architectural monuments for the most jealous care and exercised in the preservation of them from injury or destruction. The plea that they are little used and that for the one it is possible to build three or four useful churches in the suburbs, is an utterly unworthy one, fit, as a writer in the *Saturday Review* has pointed out, to be classed with the plea that was once made for an alabaster box of ointment, precious, which might have been sold for 300 pence given to the poor. I have no doubt we could extend the rates of London for ever by letting Hyde Park building plots, or we could finance a missionary society by selling the Crown jewels. There is no limit to the suggestion that may be done if the merely utilitarian principle is admitted. The people who built these churches have weakened and impoverished by civil war, by plague, by fire, and they were in constant danger from their exposure across the sea, and yet they made the sacrifice required to build them. If their descendants in the London suburbs want churches, let them pay for them themselves or show their richer brethren good reason for doing so. They have no right to rob an historic city of the memorials of those who made it great, no right to destroy the beauty they cannot replace, and no right, I think, to deprive those who do use them—there are very many who do—of the opportunity of coming into these churches to say their prayers and to rest and meditate—of their escape from the worry and hurry of City life. Mary Howitt has expressed the matter better than any words of mine can.

Mr. PHILIP NORMAN in some notes upon the subject of the Great Fire of 1666, wrote:—A dire catastrophe is apt to call forth the efforts of the master mind that can grapple with it. This was the case when, after the Great Fire of 1666, Sir Christopher Wren, at that time hardly a professional architect, attracted his attention to the City. He first produced a plan for a general rebuilding, which would have given free scope to his genius, though at the same time destroying many of the buildings of the past. The chief public buildings were to have been grouped round the Royal Exchange, which would have formed an important centre, St. Paul's Cathedral approached from the east by two broad converging streets. A river quay in part adorned by the City Halls would have extended from Blackfriars to the Tower of London, and the churches were to occupy commanding sites, their burial-grounds being outside the City. The minds were not ripe for such a change; the narrowness of the streets would have entailed a large displacement of the population. The difficulty of adjusting private property to the requirements of the public would also have been extreme, and so the City grew more or less on its old irregular lines. To Wren, however, was assigned the task of rebuilding or repairing the churches of the City. St. Paul's Cathedral, but if one includes St. Mary Woolchurch, and St. Sepulchre (both only repaired), no fewer than 17 churches of the City. In carrying out this work he had a unique opportunity which he turned to marvellous account. Living at a time when the principles of Gothic architecture had completely died out, he accepted the Classic style, but from them he evolved more or less a style of his own, suitable for the requirements of the time and climate. His originality, this power of adapting himself to circumstances, that he diverges from his great predecessor Inigo Jones, who had studied in Italy (Wren never going beyond France), and who had more completely assimilated the teachings of Vitruvius and the example of Palladio. Helped by his knowledge of mathematics and geometry, he was also a skilful constructor. His churches were made for Protestant worship as it was understood in his day. What he has said on the subject is clearly set forth in his own words, "It would be vain to make a parish church larger than the number of all who are present can both hear and see. The Royal

may build larger churches; it is enough if they hear the murmur of the Mass and see the elevation of the Host, and the Host is to be fitted for auditories."

Christopher started with no school of artists or men to help him in the detail of his buildings. As time went on he gathered together round him capable men as Strong the master mason, Jennings the carpenter, Tijou the metal worker, Grinling Gibbons created quite a school of English carving, Sir James Gandon, and others, so that he could use appropriate embellishment as far as the means at his disposal allowed. Following the example set him in the great City churches, he seldom built chancel-chancels, but usually formed a quasi-chancel by a carved screen standing upon the pews, which in some sort represented the ancient rood-loft. At St. Andrew's, the Great and St. Peter's, Cornhill, there were important screens. Pews and galleries, when occurring in ancient churches, had been usually of the nature of excrescences, but both formed an integral part of his design; for although in a letter printed in the "Parentalia" in 1711 that he would have preferred benches to pews, for reasons which are there given, he followed the then prevailing fashion. The organ, when introduced, was enclosed in some case, and was placed in a gallery at the west end so occupied by the choir. The pulpits were finely carved, and with their large sounding-boards looked very important. At the east end was a high carved oak altar, usually surmounted by the Royal arms and flanked by the Lord's Prayer, the Creed, the Ten Commandments, and paintings of Moses and Aaron. The fonts were basin-shaped vases supported on baluster shafts, and as a rule a well-carved oaken cover. Where a site was hidden away in an obscure corner he lavished his art on the interior. Inside, alas! these great works of the great Protestant architect have most of them been terribly falsified by a succession of ignorant and tasteless alterations. A common defect with the "Wren churches" is that by the addition of deeply leaded glass—often also by the blocking of windows—they have become extremely dark, so that it is necessary to use gas or electric light, the former most destructive of masonry. Upon a careful study, the rectilinear lines of Wren's glazing, at first sight a trivial detail, will be found an essential element of his design. The injury, therefore, done to the churches by the introduction of stained glass having irregular leading cannot be estimated. The introduction of machine-made tiles, far from the standards of pseudo-Gothic design, may also be added among the abominations which have disfigured the churches. It is only by visiting a succession of churches and by piecing together what one sees, that it is possible to conjure up in "the mind's eye" their probable appearance as he left them.

The churches of the City of London are gradually passing to changed conditions and the utilitarian ideas of the present day. Eighteen of Wren's buildings have already been destroyed, besides many of later date. The first to disappear was Christopher-le-Stocks, when the Bank of England was built in 1781. St. Michael, Crooked Lane, was swallowed up in the approaches to New London Bridge in 1811. St. Bartholomew-by-the-Exchange made way for the Exchange Office, and shortly afterwards St. Benet Fink was pulled down on account of its proximity to the present Exchange. Since the passing of the Union of City Act in 1860, fourteen churches designed by Wren have succumbed, and attacks on others are withered off. It is earnestly to be hoped that the public mind is now awakened to the value of Wren's churches, and that we shall endeavour to preserve one of his work that remains.

ALFRED MOORE (hon. sec. City Churches' Preservation Society), in proposing a vote of thanks to the author, Mr. Knight for reading the paper, said some of them went back to the study of the City churches with a new mind and he hoped ponder on the genius of Wren and the work of his Master. It was to be hoped, he said, that "the public," as Mr. Keen had satirically called the gentleman responsible for certain recent renovations, would profit from the remarks. There could not be too many books and papers written about London churches, for the people had yet to learn their beauty and their use. He ended by saying a few words with reference to the "City Churches' Preservation Society," mentioned by the lecturer. The wonderful Act was passed, known as the "Union

of Benefices." Apparently at that date the destruction of nearly all the City churches was contemplated, because St. Stephen (Walbrook), St. Martin (Ludgate), St. Peter (Cornhill), and St. Swithun (Cannon Street), and those only, were exempt from pulling down by clause 14 of the Act. Under its powers seventeen churches had been destroyed, twelve of them Wren churches, the others mentioned by Mr. Keen having been taken for so called improvements. When the Churches' Preservation Society was revived in 1894, three Wren churches were doomed beyond redemption, two of them having fallen into disrepair, but since then no church by him had gone. Three more were "commissioned," but the efforts of the Society prevented the vandalism. When All Hallows, Lombard Street, was under notice, those chiefly interested in the parish were interviewed, and the Society eventually, aided by friends, saved it.

MISS PHILLIMORE seconded the vote of thanks.

Mr. H. H. STATHAM, in supporting the motion, said it occurred to him while they were going through the examples to consider what it was that Wren's churches exactly showed architecturally, and what could be learned from them. He thought the great lesson was that the essentials of that fine architecture after all did not lie so much in the detail, good as that was in its way, so much as in the power of giving expression to good variety of plan and treatment of section. Each of those buildings by turn seemed to be almost a distinct idea. The shape of the ground seemed to have suggested the architectural method of treatment, and they had one after the other buildings as varied as possible, and of which the treatment in section was as varied also. They each formed a sort of architectural idea. He was inclined to dwell on that point, because it did not do to exalt Wren's detail too much. A great deal of it was probably not Wren's at all; he gave the general design of the church, and probably the greater part of the decoration was really the habitual work of the carvers of the day. Some of Grinling Gibbons's work was beautiful in execution, though he, the speaker, had never admired it from an æsthetic point of view. Another reflection he made, said Mr. Statham, was what a pity it was that the interiors they had seen were not carried out in monumental materials.

Mr. S. FLINT CLARKSON also supported the vote of thanks.

Mr. W. MILLARD said they had heard and seen a good deal of the interiors of Wren's churches, but he did not think a want of monumental effect could be charged against the exteriors of those buildings. Virtually they were big public buildings which stood up well above the houses and were not swamped as now by their surroundings. The dimensions of the churches, too, suggested how beautiful in scale the City of London must have been for a century after they were erected.

The vote of thanks was passed by acclamation.

## INSTITUTE OF IRISH ARCHITECTS.

THE annual general meeting of the Royal Institute of Architects of Ireland was held last week.

Mr. Frederick Batchelor, president, was chairman.

The hon. secretary (Mr. James H. Webb) read the report of the Council, which stated:—The Local Government Board, with a view to facilitating the formation of schemes for the erection of cottages under the Labourers (Ireland) Act, 1906, promoted a competition amongst architects by asking for designs for a labourer's cottage at a cost not exceeding 130*l.* complete. Your Council viewed with considerable disapproval both the principle of such a competition and also the conditions laid down by the Board. Several communications were received from members dealing with the working of the regulations under the Act, and your Council decided to ask the Local Government Board to receive a deputation to further explain the views of the Institute. As, unfortunately, the Board declined to receive the deputation, a statement clearly setting forth its views was prepared by your Council and forwarded to the Board. To this statement no satisfactory reply was forthcoming. Some further correspondence passed on the subject, but your Council regrets that this important public department does not apparently understand that by placing the responsibility for the erection of these cottages in the hands of unqualified men it is not promoting the public welfare, and is, by its action, creating a vast number of so called "architects" throughout the country who will engage in practice in competition with qualified men, greatly to the detriment of the public and the prestige of our profession.

The President delivered an address. Having returned thanks for his election, he said he desired to address them briefly on the duty that was laid upon that Institute, in common with all other architectural societies, to arouse public interest in architects, their functions and their responsibilities—in other words, the duty of educating the public in the fundamental knowledge of what an architect was. He believed that the secret which lay at the bottom of a great deal of the employment of unqualified men throughout the country might be traced to the ignorance which existed amongst the vast majority of their fellow-countrymen in regard to the duties and qualifications of an architect. He was not sure that that ignorance prevailed to the same extent in England, but in Ireland, and more particularly in the country districts, the very nature of an architect's work was enshrouded in mystery. Was it any wonder that whilst such ignorance existed it should appear to most people an unnecessary extravagance to employ an architect when there were so many builders to be found ready to prepare the drawings free of cost? Was it any wonder that such ignorance existed, seeing it was but the reflection either of ignorance or of indifference on the part of those who ruled in high places in regard to the development of the fine arts, and more particularly of the art of architecture? What will be the opinion of those who come after them concerning the refinement and culture of this age if they were judged by the standard of art as reflected in the buildings which were being erected by the county and rural councils through the country, or, to go even a step lower, by most of the cottages which were being constructed in such wholesale fashion under the provisions of the new Labourers (Ireland) Act? That Act, to which reference had been made in the annual report, would have, he feared, far-reaching consequences inimical to their profession, and as a natural corollary inimical also to the public interest. They had heard how the Local Government Board received a strong protest made by their Council. Mr. Birrell in a letter to the Council, in reply to our protest, stated that he fully agreed in the view expressed by the Local Government Board, viz. that the architectural work in connection with the erection of these cottages was not such as to require specialised knowledge, and that the Bill was accordingly framed so as to admit of the employment of persons who were not qualified architects. The result of that unwise policy would undoubtedly be that every person appointed under that Act to supervise the erection of these labourers' cottages would thenceforward consider himself entitled to take rank as a fully qualified architect. This was a very serious state of things, for how was the public to discriminate between men who had acquired such culture and technical skill as they possessed, after long years of apprenticeship and of unremitting study and toil, and those who had no greater right to the title of architect or civil engineer than that which might be claimed by the proverbial "man in the street"? Until the public was brought to recognise that the diplomas conferred by the R.I.B.A. and by those societies which, like their own, were in alliance with it, were the only standard of professional proficiency on which the public can place any reliance, apart from the personal reputation of the architect; until the public was able to discriminate between these diplomas and the spurious titles they should have to suffer the rivalry of the unqualified "C.E." It might be asked were these diplomas any real guarantee that those who held them were possessed in any degree of the divine gift of artistic design. Did they denote a high standard of mental culture or of architectural ability? Did they, in fact, do more than show forth to the public that their possessors were members of a trade union? These were hard questions, and if they would be honest with themselves they must admit that the standard of technical proficiency on which their diploma was conferred had hitherto been fixed less with the view to enable the public to distinguish between the real architect and his counterfeit, as with the object of enlisting within our ranks every person who, having entered the profession through recognised channels, had passed the prescribed period in the study or practice of architecture, but with little, if any, regard to the knowledge he had acquired during those years. It was this consideration, supported as it was by the urgent request of the Architectural Association that they should supply some incentive to its members to pursue the systematic course of study provided for them, which influenced that Institute in its decision to create the class of students to which reference had been made in the annual report. The qualifying

examination, the passing of which would be made a condition precedent to admission, would, he trusted, afford the required stimulus; and in order to induce a spirit of emulation among the candidates he proposed to revive the practice which obtained in former years of presenting a medal similar to the one which used to be known as the "Fitzgerald Medal," and which was presented by Fitzgerald, one of the first presidents of their Institute, some seventy years ago. Now, it must be recognised that by establishing that examination and by determining after a certain date, which had yet to be fixed, medals should be recruited solely from the studentship class, the Institute had embarked on a course which would, if successful, remedy some, at least, of the evils to which he had referred. But they must face the fact that the way to success lay through registration, and he regarded the recent decision of this Institute as the first definite step in that direction. He felt that there existed in Ireland a pressing necessity for the protection which would be provided in a measure for the statutory qualification of architects.

Council for the year 1908 consists of the following Messrs. George C. Ashlin, W. M. Mitchell, R. C. O'Connell, C. H. Fishworth, G. P. Sheridan, C. A. Owen, H. Allen, A. E. Murray, C. J. MacCarthy.

#### APPLIED ARTS AND SCIENCES.

THE committee on applied arts and sciences of the American Institute of Architects was instructed to consider such questions as, first, "How to overcome unsatisfactory conditions due to the severance of intimate relation once existing between architect and craftsman;" second, "How to facilitate the delegation of design to craftsmen;" and third, "How to secure assistance to the architect in his work from the arts and crafts movement." The following report is the result of their inquiry:—In order to know how to overcome the unsatisfactory conditions due to the cause above stated, it is necessary to understand the nature of the original conditions and the reasons underlying the changes which have led up to and still compel "the severance of the intimate relation once existing between architect and craftsman." Even with a knowledge of the facts, power to do not always follows desire to do, and to overcome or to know how to overcome the unsatisfactory conditions is not within the power of a single committee, a single body, or a single generation. A partial knowledge, however, may suggest mitigations, where it cannot effect radical change. The intense apathy of the great public toward art, the general lack of knowledge or care as to what constitutes art, the art touches life, the utterly commonplace and devitalised attitude on part of public and designer, of seeking the path of least resistance, of harking back to something which is well known and can be recognised on the instant—all this conspires against the elevating of art standards and the architect, if he would, cannot rise above the general flood of wilful and self-satisfied satisfaction. It seems perfectly demonstrable that in great periods of art everybody loved and appreciated beauty, whether actual producers thereof or not. The power to create and the capacity to appreciate it sprang from the conditions of life and inherited in all classes—at least the capacity for appreciation was general. The artists themselves, until the Renaissance, were drawn mainly from one class, and that not socially a high one. They were banded as brothers; their training was within and was developed by association; their minds were of about the same calibre, and mutual sympathy in the art and ideal made for the best. Class distinctions in art do not exist in the lofty periods as they do now. Even in a great democracy these distinctions are most clearly marked. The doers, that is the craftsmen, are of the lower class; the designers are a grade higher in the social scale. The architects are coming more and more from the cultivated class, and, unfortunately for art, many of the independent means are seeking the profession because the work is genteel. The art patrons and they who may dictate the monumental art of the world are of the moneyed aristocracy. The assumption of knowledge and the possession of it in the upper classes begets in the mind of the worker a dull subservience which does not make for art, and on all accounts is to be deplored. The general system of education is herein at fault, for it touches life superficially and gives to "educated persons" a

attering of the non-essentials of art and to the workman-ness knowledge, the sole end of which is its mintable-ity. And life has not gained by that phase of modern-ization which devotes its energies to developing art-lucers. Once art was lived, now it is taught. "Schools-t" have come to be considered necessary. But schools-not seem to have justified themselves, while they do-in no small measure to justify the proverb, "When-ols come in, art goes out."

an irrational system of general education, then, and-ly drawn class distinctions, especially in the field of-production, would seem to be marked factors in this-stance of ties between architect and craftsman. ising the great advantage to the art worker in the old-ate conditions, many great and rare minds have-ated an advance beyond the unsocial and wholly-onal tendencies of modern life, to an ideal existence-r State socialism, viewing the matter as one falling in-ange of political economy. It would seem that in this-have not been wholly justified, for the great creative-ds of art and those referred to during which love and-ociation of art have been general, have occurred under-d forms of government and have been wholly inde-ent of the nature of the governmental structure. The-r is largely one of social ethics, of mental development-f social economics, and not at all of governmental-s. The socialism which shall bring joy in labour is-cessarily governmental, but it is greatly to be feared-the socialism which is governmental will operate to-e humanity to one dead level of incentive, of capacity-ievement, and may be of recompense, though that is-not importance. The arbitrary apportionment of task-1 must almost of necessity accompany any system-ate initiative and supervision of activities cannot-ise than stunt personality and individuality. But-phase of socialism will hardly endure, for the-ilation of the distinctive functions of the various-pers can no more prevail in the body politic-it can in the individual, the body natural. For by-e and design (if we grant to the great universe a-ing force) certain individuals, as certain members, are-nted—not condemned, but consecrated—to do certain-and the pleasure and profit to the individual need not-arily be in the work he performs, except as that work-essary to the wholesome life of the body general. In-words, the feet are not to take upon themselves the-of the hands; the heart finds itself in deep and-ed waters when it takes upon itself the functions of-ain; the brain is incapable of doing the work of the-

The effort of a new civilisation should be, not to-individuality, not to smooth to a dead level the face-ure, the southern slope which catches the sun and the-l eminence which shields it from the winds, but to-life tolerable where it has been intolerable, to make-bloom where no beauty has been, to minimise as-possible the burden of irksome toil and to make the-l conditions of life productive of the higher happiness.-gh education and better environment the State may-he general life fruitful of sane enjoyment. A broader-ion, a wider sympathy, a deeper knowledge of the-s of life, a developed love of beauty in the mind of-e and a passionate zeal to express it, will reunite the-ed relation of intimacy which once existed between-, interpreter and laity; that is, architect, craftsman-ublic.

til an advanced state of art endeavour and of art-iation has been reached the architect need not-ily concern himself with the matter of delegation of-to craftsmen. The question is, rather, how far shall-rsonal equation be allowed to enter in the inter-on of a sketch by the craftsman? No broad-minded-ct shuts himself off from the suggestions of draughts-r craftsman. But unless there be a singleness of-t and purpose in the minds of architect, assistant and-eter, an understanding born of long seasons of sym-c interchange of thought and idea, suggestions will-arely toward a unified expression. The wise archi-ill seek to have about him understanding and-hetic assistants in all branches, but the architect need-k to escape the travail of creation. Does the work-own upon him? He must realise that beauty comes-1 stress, perfection through infinite pains, life comes-rough death. The practical solution of the problem-ay would seem, then, to be for the architect to bring-as far as possible into the same relation with the-an that he holds with his assistant over the board,

and failing that should seek the craftsman whose work expresses a parallelism of idealism and motive, and having found, employ that hand to execute the work and that mind to interpret the sketch.

The so-called arts and crafts movement, we must frankly realise, has not yet entered the stage in which it can be of much or of any assistance to the architect. The movement as such has not yet affected the great body of craftsmen. Artists and craftsmen connected with the movement have confined their thought and activity mainly to the design and execution of single and simple objects of use or beauty, such as pieces of furniture, household utensils and bits of decoration. In most of this production the amateur spirit is manifested and not any of it bears upon the greater problem of architecture. Most of the artist-craftsmen have no intimate knowledge of architectural principles, which is to be regretted; and, too, they have had no architectural schooling, upon which they are to be congratulated, at least those of them to whom such schooling would mean the acquirement of an academic method and a frame of mind which expresses itself in the application of architectural details to the various simple objects rather than in a lucid recognition of the limitation of materials and a frank adaptation of form to use. It is in the design and execution of stained glass for windows and ornamental metalwork and carvings, which the arts-craftsmen are called upon occasionally to accomplish, that the want of appreciation of architectural and structural lines most manifests itself. Now and then arts-craftsmanship has undertaken to impress its spirit upon some modest example of cottage architecture, and has succeeded; but these are sporadic cases, and do not affect in any way the general tendencies. The architecture of the cottage, of the lesser house, of the villa, of the mansion, of the palace, is but a reflection of the greater architectural spirit, and until architects have learned to handle the greater architectural problems, and to solve them on their merits without reference to conventions established in other climes, under other conditions, the lesser architecture will suffer from and express the same want of capacity for freshness of invention and directness of thought, the same inability to more than rehash old *motifs* which finds expression in the greater and the monumental architecture of the day.

It were unjust to place upon the architect the entire blame, for blame there is, in all this abuse of tradition. It were better to attribute it in the large part to the lack of taste and of knowledge which exists because of the certain deficiencies in our civilisation, the lack of correct methods in education which fosters the general ignorance of and indifference toward all forms of art. The germ of hope lies in the attitude of some of the lesser architects, and in the arts and crafts movement—not so much in what it has accomplished as in the spirit which animates it. The movement portends an awakening to art consciousness. But great and monumental architecture must be the expression of a deep, broad, spiritual life, and cannot be built up by accretions to any movement, however vital, sincere and wholesome it may be. The lesser architecture must, in the final expression, follow and reflect the greater. Yet even to-day, while in special instances the architect may enjoy the assistance of the individual artist-craftsman, architecture in general reaps no advantage from the arts and crafts movement.

#### The United Arts Club Pictures.

SIR,—Referring to the full report you gave last month of the proceedings in the Court of Appeal, when I failed to get protection for the 195 artists whose pictures, &c., were seized by the superior landlords of the club's premises, your readers will be pleased to know that with the assistance of a few kind sympathisers and the forbearance of the superior landlords, I have succeeded in buying back the artists' property, and the works are being returned to the owners free of expense to them. I am also glad to say that after December 31, when the exhibition now being held at the Grafton Galleries ends, the club will continue to be carried on at Rumpelmayer's in St. James's Street, where excellent premises have been secured for the accommodation of members and the holding of exhibitions, concerts, &c., as heretofore.—Yours faithfully, F. C. T. CHALLONER.

Grafton Galleries : December 1907.

## GENERAL.

**Mr. T. E. Mansh**, stated to be the oldest member of the Institute of Civil Engineers, died on the 19th inst. at Grosvenor Place, Bath, aged eighty-nine. Deceased was assistant to Mr. Brunel, the engineer, who constructed the Great Western Railway.

**Mr. David A. Donald, C.E.**, Newport, has been unanimously appointed burgh surveyor of Grangemouth. The salary is 160*l.* per annum.

**The Arrangements** for the third international congress for the development of drawing and art teaching, which is to be held in London from August 3 to August 8 next, are being rapidly pushed forward. H.R.H. the Prince of Wales has consented to become the patron of the congress. The branch of the congress dealing with the application of art to industries will be very representative, and has already aroused the interest of many large manufacturers. It is hoped that the congress will not only give an impetus to the teaching of drawing in all schools, but will form the basis of a better co-ordination of art instruction from the primary schools to the schools of art or craft schools.

Since **Mr. Burns** became president of the Local Government Board, in December 1905, the Board's inspectors have held inquiries into 91 housing schemes (49 being formal, after public notice, and 42 informal), and 62 have been sanctioned. The total amount of the loans which have thus been authorised is 332,955*l.* The items include the following:—Bangor, 6,919*l.*; Birmingham, 4,000*l.*; Bolton, 4,540*l.*; Bradford, 21,858*l.*; Chiswick, 11,100*l.*; Coventry, 13,630*l.*; Hornsey, 45,390*l.*; Leeds, 34,681*l.*; Liverpool, 1,864*l.*; Manchester, 14,867*l.*; Merthyr Tydfil, 13,760*l.*; Richmond (Surrey), 20,002*l.*; Sheffield, 19,120*l.*, 29,208*l.*; Sunderland, 29,633*l.*

**A Deputation** from the Stockport Town Council visited Birmingham last week to inquire into the question of the housing of the working classes in the city. They were received by the chairman (Mr. J. S. Nettlefold) and other members of the housing committee, and were driven to several parts of Birmingham and shown the improvements that had been carried out.

**A Lecture** was given by Mr. E. W. Harvey Piper before the Architectural Association Camera Club on "Southwell Minster." It was illustrated by over a hundred lantern slides, and described details fully.

**The Finance Committee** of the Liverpool Corporation have appointed a sub-committee to continue negotiations with the Docks Board and the Custom House authorities for the purpose of combining in one building a Custom House and salt-water baths, the latter in the basement of the block. Architects had expressed the opinion that it was possible to build the combined building on this site, which is 3,700 square yards in extent, and which the Docks Board (it was hoped) would dispose of at 5*l.* per square yard. The mutual difficulty lies in the determination of the Docks Board that no building higher than two storeys be erected on this site, as it would detract from the appearance of the new docks building. It is now hoped that the Board, who are strongly in favour of the new Custom House, will waive this stipulation, otherwise the scheme cannot be recommended to the City Council and the Treasury.

**At a Meeting** of the Town Councils of Banff and Macduff, as the administrative body of Duff House, an animated discussion took place on the question of the utilisation of the gift. Plans with estimates of the cost of adapting the building for the purposes of a hydropathic were submitted, and it was agreed to advertise inviting a syndicate or any person to make an offer for leasing the building.

**The University of St. Andrews** has resolved to confer the honorary degree of LL.D. upon the following:—Lord Avebury, Mr. Francis Darwin, president-elect of the British Association; Mr. Philip Norman, treasurer of the Society of Antiquaries; Sir E. J. Poynter, president of the Royal Academy.

**A Meeting** of the Holyrood Chapel restoration committee of the St. Andrew's Society was held in the City Chambers, Edinburgh. The meeting had before them a letter from the agents of the trustees appointed by the late Lord Leven in which, it is understood, they state the adherence of the trustees to their former decision. The letter was in reply to a communication sent by the committee, who forwarded the views of builders and architects as to the feasibility of the restoration of the chapel. The committee decided to place the whole correspondence and relative documents before the public at an early date.

**The International Society of Sculptors, Painters and Gravers** will hold two exhibitions following each other at the New Gallery, the first the ordinary general exhibition which will have an unusual show of the most advanced foreign work, and the second a modern exhibition of "Women." MM. Blanche, Bernard, La Gandara, Bolognini, Rodin and all the great foreigners will be well represented and there will be a special collection of the British section. The private view of the first exhibition will be held on the evening of January 7.

**There was a Large Gathering** at the Municipal School of Art, Birmingham, on Saturday, consisting of the numerous members of the staff and past and present students, to show their regard for Mr. Charles Morgan, who, after forty years of service to the school, is retiring, in accordance with the provisions of the superannuation scheme. He has served under three successive head masters, and since 1898 filled the post of second master. The parting gifts consisted of an address, together with a sum of money sufficient to defray the cost of a prolonged continental tour.

**The Crewe Education Committee** have announced that Earl of Crewe had accepted the offer of the Cheshire Education Committee of 6,050*l.*, for ten acres of land on the Crewe Hall estate, to be used as a site for the proposed training college for teachers. The college will command a fine view of Crewe Hall Park. Dr. Hodgson, chairman of the County Education Committee, said the college would be easily accessible to students from all parts of Cheshire in touch with Crewe's model school.

**Mr. John B. Westcott**, for thirty years architect and surveyor to the Office of Works, died suddenly on the 16th inst. Mr. Westcott entered the department as an assistant surveyor in December 1877, and was many years in charge of the post-offices and other buildings in the south-east district of England. In 1893 he was made first assistant to Sir John Taylor. On his retirement, in 1898, Mr. Westcott was appointed to succeed him as architect and surveyor in charge of the Royal Palaces, Houses of Parliament, British Museum, and public buildings generally in London. He carried out extensive internal alterations at Windsor Castle and Buckingham Palace. More recently he was responsible for alterations at the Houses of Parliament, a vaccine station at Hendon for the Local Government Board, the extension of the Patent Office in Fumival Street, and alterations and additions at the Royal Mint. He was at the time of his death in charge of the new block of the National Gallery.

**Formal Notice** is given of the intention to promote in the ensuing session of Parliament a bill relating to the Malvern Hills. Among other things this will propose to enlarge the powers of the conservators, to prohibit quarrying on any part of the Malvern Hills in a manner that may prove to be a temporary or permanent disfigurement of the scenery, and to empower the conservators to make and enforce by-laws for regulating the operation of quarrying on any part of the hills.

**We Regret** to have to announce the death of Edward George Hayes, A.R.I.B.A., which took place at his residence, 18 Norfolk Road, St. John's Wood, N.W., on the 21st inst. Mr. Hayes was for over thirty years a member of the firm of Searle & Hayes, of 66 Ludgate Hill. He was formerly of Paternoster House, E.C., from which he retired only a few years ago. In his earlier career Mr. Hayes served in several offices in connection with the Architectural Association, including that of President.

**A Quarterly General Meeting** of the Glasgow Institute of Architects was held on the 18th within the secretaries' chambers, St. Vincent Street, Mr. James M. Monro, president, in the chair. The following were unanimously elected Fellows of the Institute, viz.:—David V. Wylie, 102 Bath Street; Robert Wemyss, 103 Bath Street; Charles E. Whitelaw and Henry Mitchell, both of 219 St. Vincent Street; and it was reported that Messrs. Balfour Abercrombie, 131 West Regent Street, and James Allan Lauchlin, 9 London Street, had been elected associate members. The Institute resolved to support a motion to be made at a meeting of the R.I.B.A. on January 6, by Mr. G. A. Middleton, dealing with the question of alterations in the existing by-laws of the Royal Institute so as to provide for the competency of demanding a poll on any resolution of the fellows and associates, provided that such poll be demanded by at least twenty-five members, of whom the majority shall be fellows, and that the resolution has been either passed or negatived by a majority of less than two-thirds of the present and entitled to vote. The dinner of the Institute to celebrate the union of the Institute with the Glasgow Architectural Association will be held in February.

## NOTICE TO ADVERTISERS.

no circumstances whatever can the Proprietors  
of this Journal guarantee alteration of copy if  
received after the first post on Tuesday mornings,  
and no proofs can be submitted if copy arrives  
after than first post on Saturday mornings.

## EDITORIAL NOTICES.

of the many difficulties which are certain to arise in  
connection with the law, practice rules and procedure under  
the Workmen's Compensation Act, we have added to our  
staff A VERY EMINENT BARRISTER, who has  
made the subject a special study, and will be glad to answer  
the columns of this paper any questions relating to the  
complicated matters arising from the provisions of this  
difficult Act. Our LEGAL ADVISER will further  
answer any legal question that may be of interest to  
our readers. All letters must be addressed "LEGAL  
ADVISER," Office of "The Architect," Imperial Build-  
ings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications  
as brief as possible. The space we can devote to Corre-  
spondence will not usually permit our inserting lengthy  
communications.

The Editor will be glad to receive from Architects in London  
and the Provinces results of Competitions and Tenders  
and other particulars of Works in progress in which they  
may be interested.

No communication can be inserted unless authenticated by the  
name and address of the writer—not in every case for  
publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must  
necessarily be held responsible for their contents.

## TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-  
appearance of Contracts Open, Tenders, &c., it is par-  
ticularly requested that information of this description be  
forwarded to the Office, Imperial Buildings, Ludgate  
Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

IRELAND.—July 20.—The County of Cork Joint Hospital  
Board invite competitive plans for a sanatorium for con-  
sumptives with accommodation for seventy patients. A  
prize of 100l. will be paid for the plans which the Board  
may adopt, provided that said plans are sanctioned by the  
Local Government Board, and said plans shall become the  
absolute property of the Board. Intending competitors  
will receive a map of the site and other information on  
sending P.O. for 10s. to Mr. E. J. Murphy, secretary of the  
County of Cork Joint Hospital Board, Court House, Cork.

WEYMOUTH.—July 30.—The Weymouth Town Council  
invite designs for a pavilion to be erected on the north side  
of the pier. One hundred guineas will be awarded for the  
selected design, such design to become the property of the  
Council. Mr. H. A. Huxtable, town clerk, Municipal Offices,  
Weymouth.

WESTHOUGHTON.—For the erection of a hotel at Westhoughton, Lancashire. Deposit 2*l.* 2*s.* Mr. Ernest W. Dyson, architect and surveyor, 10 Regent Street, Barnsley.

DR. E. P. MANBY, one of the medical inspectors of the Local Government Board, who has made an inquiry as to the sanitary administration of the Brentford Urban District, has reported that the securing of improved dwellings for the poor is the most urgent reform needed in the district, and he advises that the Brentford Urban District Council should without delay give effect to the provisions of Parts 1 and 2 of the Housing of the Working Classes Act, 1890, relating to insanitary areas and to insanitary houses, and should also carefully consider whether it might not with advantage take further action under Part 3 of the Act.

THE Association of American Portland Cement Manufacturers some months ago invited competitive designs for concrete houses. The competition was divided into six classes, which included single and double houses, ranging in cost from 2,000 dols. to 4,500 dols. The total number of designs submitted was 208. Over three-fourths of these were in the classes for single houses, and eighty-five designs were for single houses of the highest cost, 4,500 dols.

VOLUME LXXVII. OF THE ARCHITECT  
Handsomely bound in Cloth Gilt Lettered,  
6-11 Imperial Buildings Ludgate Circus

## TRADE NOTES.

C. H. SHORLAND & BROTHER, of Manchester, have supplied their patent Manchester grates for the City Council schools.

In addition to their inaugural sale Messrs. Oetzmann, also disposing of the stock of Messrs. Ravilious & Co. of London, from 40 to 70 per cent. The company's grates can be seen on the stages of the Playhouse and the Theatres.

It is informed that the Bispham Hall Brick and Tile Works, of Orrell, near Wigan, have supplied Messrs. Gross & Corby, 11 and 12 Finsbury Street, E.C., their representatives for architectural terraces in London and the Eastern and Southern Counties.

JOHN G. AMES, who was for many years connected with Messrs. R. W. Blackwell & Co., engineers and contractors, City Road, E.C., as the manager of their Manchester branch, has, after visiting the United States, been appointed manager of the Barrett Manufacturing Company, 10, South Place, Finsbury Pavement, E.C.

As a result of the recent attempts at smuggling goods, a new arch-room has been erected at the Royal Naval Dockyard, Portsmouth, by H.M. Admiralty. It is constructed with Douglting stone dressings supplied from the quarries at Ham Hill and Douglting Stone. The stone is the same and matches that in the main buildings erected some five years ago.

## VARIETIES.

Blackpool Town Council have approved the minutes of the general works committee, which included a recommendation that the Local Government Board be asked to grant a loan of 14,900*l.* to carry out a sewage scheme.

Blackpool Town Council, after some eighteen months' discussion, have agreed on a site for a proposed library. It consists of 16,187 square yards on the Mill Estate, and the total cost, inclusive of the cost of roads, is expected to be about 11,000*l.*

A LARGE chiming clock with four illuminated dials is being fixed on the Victoria Mills, Draycott, Derbyshire, which will be of great use to the inhabitants. It is being made by John Smith & Sons, Midland Clock Works, Derby, to the designs of the late Lord Grimthorpe. The same firm made clocks for the neighbouring churches of Breaston and Sawley.

THE education committee for the borough of Newark have accepted the tender of Mr. William Smith, builder, Newark, at 7,110*l.*, for the erection of elementary schools for the east end of the borough. The cost of the schools, with the land and furnishing, is estimated at 9,000*l.* They will accommodate 600 children.

A LOCAL GOVERNMENT BOARD inquiry was held at Derby into the application by the Corporation for permission to borrow 51,850*l.* in connection with the extension of the electricity undertaking. The inquiry was conducted by Mr. H. R. Hooper. There was no opposition. The town clerk said that twenty-five years was asked as the term for the repayment of the loan.

FOR the convenience of travellers to Belgium by the Harwich route, the Great Eastern Railway Company have just placed on the Antwerp express train from Liverpool Street station dining and breakfast cars, in which table d'hôte dinner and other refreshments are served on the down journey and table d'hôte breakfast on the up journey.

DURING a discussion by the Westminster City Council on the proposal of the London County Council to widen the Strand at the corner of Agar Street and King William Street, Mr. Abady said the cost worked out at 1,283,000*l.* an acre. The Council decided not to contribute anything to the improvements unless the corner was rounded off. This was not shown on the County Council plan, and unless such a course is adopted the Westminster Council consider that very little relief will be afforded to the traffic at that spot.

AN inquiry was held at the Portsmouth town hall last week by Mr. F. H. Tulloch, inspector of the Local Government Board, into the proposal of the Town Council to borrow 17,688*l.* (the first estimate was 15,000*l.*) for works of electric lighting. The committee desired to increase the capacity of the generating plant at the station. Sometimes,

# THE "DRAWWELL" GRATE

WAS PLACED

## First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

**N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.**

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

where the "Drawwell" can be seen in action.

when the tide was very low, they were not able to get sufficient circulating water and thus keep up a good load. Also during the winter four months it was necessary to run the whole of the machines during the hours of heavy load, the undertaking having then no "stand-by." A second inquiry was subsequently held into the proposal of the Corporation to borrow 10,596*l.* for asphaltting various streets.

At a meeting last week of the Glasgow Corporation's special sub-committee on the utilisation and laying out of the estate of Riddrie, Mr. A. B. M'Donald, the city engineer, submitted an additional ground plan of the estate, combining a scheme for the erection of cottages, as well as a continuous range of self-contained houses of not more than four or five apartments each. It is recommended that the plan be lithographed on a reduced scale suitable for being sent out to builders, and that thereafter builders be invited to offer to feu portions of the estate for the erection of self-contained dwellings or semi-detached cottages in general conformity with that plan, and also upon condition that the designs of the buildings to be erected shall be subject to the approval of the Corporation.

The general purposes committee of the Westminster City Council recommend a change in the methods of dealing with sick workmen in their employ. Under the present system a workman in case of sickness or accident is required to obtain weekly medical certificates before being paid sick or accident pay. In 1906 these certificates cost the Council 303*l.*, and during the year ended March last 220*l.* The cost of the certificates is much more than was anticipated when the system was introduced, and although the committee report that they are not aware that malingering has been practised to any extent, it is rendered easy, if not encouraged, by the present system. It is suggested that the Council adopt the principle of providing medical attendance and medicine for their workmen, and of appointing such medical practitioners as may be necessary for the purpose at an inclusive sum per man per annum.

At the meeting of the Worcester City Council on Tuesday the water and sewerage committee reported a complaint by the Local Government Board of delay in the completion of the sewage-disposal works, for which several dates had been given by the city engineer. In view of these varying

statements the Board directed that if the works were completed by February 29, 1908, which they were, would be ample time for completion of the work, there would be no alternative but to instruct their solicitor to initiate further proceedings. The chairman of the committee said to complete the work in the stipulated time would be necessary to employ two shifts of men eight hours per day, and add to the plant. The Council decided to adopt this course. It was further stated that the prospect of a settlement of the dispute between the engineers and contractors for the tunnel under the river in connection with the works, which it was proposed to submit to arbitration.

#### BELFAST GARDEN ESTATE.

In connection with the exhibition of houses on the Estate, Cliftonville, Belfast, Mr. Maurice B. Adams, assessor appointed to award the prizes, remarks: "There were ten types of houses built, and 700*l.* was offered in premiums. The houses divided into three classes to cost respectively 240*l.*, 275*l.* and 350*l.* each, and ordinary building materials according to the city list. A prize of 50*l.* was likewise offered for the architect of the first-prize dwellings in each class, in addition to a premium on the house for the builder. In class A, Mr. Samuel Ewing obtained the first prize, Mr. W. Martin more being the architect of the house erected on Mr. William Kerr's house on plot 1, designed by Mr. W. J. W. Roane, architect, was accorded the second prize, but owing to excess of cost was disqualified from being among the prize-winners. The second prize was accorded to Mr. James Kidd for the house on plot 11, designed by Mr. J. St. J. Phillips. The third prize in this class was given to Messrs. McKenzie & Risk for their house on plot 14. Mr. James Risk was responsible for the house. In the second class Mr. Samuel Ewing was awarded the first prize for house on plot 5, and Mr. George Mitchell, the architect, obtained the premium offered for the design. The second prize was given to Mr. James Kidd for his house on plot 10. The architect was Mr. J. St. J. Phillips. The third prize was won by Mr. James H. Barton for his

the Institution of Mechanical Engineers—Mr. T. Ches, president of the Institution.

At the outset of their report, the committee admit that their aim is chiefly to furnish some general guidance as to the application of ventilating fans, as experience has shown that serious mistakes are frequently made in the design of such ventilation. Low-pressure fans, high-pressure fans, the volume of air required and the arrangements of inlets and outlets are fully discussed, the high-pressure fans being

shown to be adaptable to places where narrow or tortuous ducts cannot be avoided, while the low-pressure variety are only suitable where there is little resistance on either side. As regards the removal of dust, the committee state that the standard of purity aimed at should always be sufficient to prevent injury to health. They add:—"Dust from the disintegration of hard stone, steel grinding, &c., is extremely deleterious, and the same may be said of dust containing any poisonous constituent, such as lead. In such cases the dust should by special means, apart from general ventilation, be entirely prevented from mixing with the general atmosphere of a room." Various methods achieving this object are suggested, one being the local use of exhaust fans. In dusty operations mechanical arrangements, boxed in, are suggested as an auxiliary; and where such arrangements are not possible the use of efficient respirators is recommended.

The effect of ventilation on the temperature of a working room during cold weather needs careful regulation. For sedentary work and fine manipulations a temperature of not less than about 60 deg. is required. With lower temperatures the working powers of those present become impaired, and the effects of the low temperature are much increased by draughts. On the other hand, if the work implies active exertion, lower temperatures are permissible; and some kinds of work associated with dust, fumes, &c., can best be performed in sheds open to the air. In general, the more nearly open-air conditions can be attained to in any class of work the better, and, wherever possible, windows should be thrown widely open in summer weather.

In general ventilation by fans the air may be either blown in (so-called "plenum" system) or exhausted. The one or the other system may be most suitable, according to circumstances, and in some instances the combination of both systems is desirable and most effective, as in the French or so-called dry cleaning, where the fumes of benzole, &c., require to be locally exhausted and fresh air supplied. The exhaust system is much employed on account of its simplicity, especially in sparsely occupied rooms, the air being exhausted by one or more fans placed in windows, walls, or roof, and allowed to enter by suitably arranged openings distributed at other parts of the room. The main advantages of this system are that no ducts are needed, and

that the fan causes no draught in its neighbourhood; the cold incoming air causes little draught if given an upward direction so as to mix with the warm air in the room above the heads of the occupants. A fan or opening of any kind draws its air supply from a particular direction, without causing a draught in a particular direction. However, air is entering through a fan or other inlet driven in a definite stream straight forwards owing to the momentum which has been communicated to it.

With exhaust ventilation corresponding inlet openings are essential, apart from the chance opening of windows or doors. The inlet openings should have a total area equal to or greater than the fan opening, and should direct the air upwards so as to avoid draughts. A considerable amount of air may enter through the cracks, &c., of a room, this quantity is usually insufficient to compensate for the loss of air by the exhaust fans, owing to the neglect of inlet provision exhaust fans may often be seen wasting most of the power communicated to them and producing no satisfactory result. The inlets should be so placed that the whole room is properly supplied with fresh air, the incoming air not being allowed to pass straight to a fan without displacing a proportion of the foul air of the room. It is often an advantage to have the exhaust outlet at the floor level. With this arrangement dust and particulate matter, instead of being drawn from the mouths and persons of those present, is more effectually removed since all particulate matter is caused to fall. Loss of heat from the room is also diminished, as the air at the floor level is colder. On the other hand, the products of combustion of gas are best removed by an outlet opening higher up.

In the matter of respirators the committee point out the drawbacks, and say:—"Except where the work is definitely dangerous and cannot be dealt with by exhaust ventilation or by using wet processes, or in other ways, we are unable to recommend the use of respirators as an alternative to keeping the air clear of dust. For the exceptional cases in which it is necessary for men to work in air containing poisonous or otherwise dangerous dust, the mouth of the respirator may be kept covered by a sheet of fresh cotton-wool. This is declared to be a reliable and efficient respirator. Where work has to be performed amid poisonous gas fumes a smoke-helmet is recommended.

**WORCESTERSHIRE ASYLUM.**

Asylum on the Barnsley Hall estate, near Broms-  
nprises a main building to accommodate 570  
and includes administrative departments which  
e to meet further extensions of the institution to  
r 1,200 patients. Wards for the sick and infirm, a  
ward and provision for the various classes of  
ients, are included in the present arrangements,  
is a large recreation hall which can be used as a  
l, the large kitchens and offices being adjacent to  
proposed to build in the future a detached hospital  
tients, and other additions will include blocks to  
ed to the main asylum or detached villas or  
omes. The contract for erecting, furnishing and  
the asylum amounted to 151,475*l*, and other  
or laying out the estate and the provision of heat-  
ing, water supply, sewerage and farm works  
p the total cost to 215,887*l*. The whole of the  
h the exception of the sewerage, has been carried  
the estimated cost.

opening the toast of "The Architect and Builders"  
osed by Mr. M. Tomkinson.

T. Hine, the architect, in reply, said there were  
ef considerations in designing a building like that.  
was that it should be planned in such a way that  
al men in charge should have the best opportunity  
g the patients, who must be also protected from  
hief they might inflict on themselves or others,  
he same time to give them a bright, comfortable  
y home. The second consideration was to have  
durable materials which would not involve a heavy  
arge for maintenance, and on that it was some-  
irable to expend a little more in the initial way as  
greater economy in the long run. The third con-  
i was to provide for the first two results at a  
cost without waste or extravagance. He was very  
e able to inform them that there would be no  
On the other hand, there would be a saving  
or three thousand pounds on the sum provided,  
of a number of extra works ordered by  
mittee which were not in the original con-  
e would not take credit to himself where it was

not due, for a great deal belonged to the committee, who,  
by putting off the building for two and a half years until  
the boom in building had subsided, had saved some 20,000*l*  
on his original estimate. The success in the erection of  
that asylum was in great measure due to the generous con-  
fidence and support given him by the committee. In the  
many difficulties that had arisen his advice had had the  
very best consideration, and if he might say so without  
being invidious, he thanked them, but particularly the  
chairman, Mr. Bowen, whose interest in every detail of the  
work had never failed.

Mr. Whitehouse, the builder, also replied, and assured  
the company that the work entrusted to him had been a  
labour of love, as well as one of anxiety. Expense had not  
been spared on his part to give every satisfaction, and it  
was indeed gratifying to know that the work had been  
successful, and that, having seen it, they appreciated it.  
He regretted that the name of the builder had been left off  
the foundation-stone and hoped that the omission would be  
rectified.

**TOOTING BATHS.**

THESE baths have been erected for the Wandsworth  
Borough Council on the site of the old vestry hall, Tooting  
Broadway, London. They have been built to the designs  
and under the superintendence of Mr. Henry Druery,  
M.S.A., architect, and Mr. E. R. Dolby, M.Inst.C.E. (Dolby  
& Williamson), consulting engineer. The accommodation  
provided is twenty spray baths on the ground floor for men  
and eight slipper baths on the first floor for women; the  
building is so designed as to admit of extensions being  
easily made. The building contractor was Mr. Chas. Gray  
and the engineering contractors Messrs. J. E. Boaz & Co.  
The following were sub-contractors:—Homan & Rodgers,  
fireproof floors; Malcolm McLeod & Co., granolithic paving  
and steps; British Challenge Glazing Co., glazing of roofs;  
Sedding & Co., lead lights and casements; Doulton & Co.,  
baths; J. Tylor & Sons, Ltd., sanitary fittings; J. F.  
Ebner, wood-block flooring; Strode & Co., railings and  
gates. The foundation-stone was laid on July 28, 1906, by

the Rev. J. H. Anderson, M.A., rector of Tooting, and the building was opened to the public on Monday, June 24, by the mayor of Wandsworth (Councillor Wise, J.P.). The estimated cost of the building, inclusive of an office for the rate collector, was 6,250*l.*, and it is expected that this sum will not be exceeded.

### CONDEMNED HOUSES IN LIVERPOOL.

It appears from a report just issued by the housing committee of the Liverpool Corporation that, notwithstanding the enormous amount of work done in demolishing insanitary property in the city, there are still remaining 7,421 structurally insanitary houses to be dealt with. Reporting on the work of rehousing the people dispossessed by the demolition of insanitary property, the committee state that since 1900 the Corporation have themselves erected 1,551 tenements, and there are 123 more in course of erection, while 1,000 dwellings have been erected by private builders on land sold to them by the Corporation for the purpose. At the present time the committee are dealing with three other condemned areas upon which 180 houses can be erected, and in regard to five further unhealthy areas improvement schemes have been approved by the City Council. As to policy the committee feel that town improvement and housing should, where possible, go hand in hand, and by continuing the present policy of considering improvement schemes on as large a plan as possible the committee hope that ultimately a large area, in which there has been the highest death-rate, will be rebuilt, and that reconstruction will be carried out with due regard to any possible street or other improvement.

### SANITARY ENGINEERING.

A PAPER on "Engineering and Architecture in Promoting Public Health" was read at the Public Health Congress, Douglas, by Mr. William Goldstraw, ex-city building surveyor, Liverpool. He took a general survey of the works of engineering and architecture usually carried out by public bodies for the promotion of public health, and pointed out that in four classes of these works the skill of the engineer

was required, in four others the services of the only, whilst in four others again the architect engineer usually collaborate. The combination of qualifications in one person, the official surveyor, justified the custom of Corporations and other bodies entrusting the design and supervision of public works to their responsible officials. It was remarked that the laying out of new suburban roads was still left to the landowner and no serious change was probable until public health took a more definite form. Two subjects, however, ripe for action—excessive dust on country roads and excessive noise in town streets. On the first question the known as "tarmac" might give good results, but the question of street noises had not been earnestly tackled. The conditions were distressing and, in a measure, disgusting. The ventilation of sewers was a question awaiting a solution than had yet been found. In the disposal of sewage, whether in seaboard or inland districts, the treatment might be looked for in some one of the several bacterial tank systems on sewage farms. The burial of town refuse in large "destructors" was one of the greatest sanitary advances made in this generation. In towns water supply it was advised that the local authority should generally call in the best expert advice, and pointed out that the present system of impounding by masonry dams was only about fifty years old. The erection of palatial bath buildings was deprecated when such schemes militated against the provision of baths for the people. In the construction of hospitals the advanced skill of the modern architect was most required, and the question whether the official or non-official architect should be employed must depend on his competence and experience. For the greatest improvement in the disposal of the dead, sanitarians might look to the establishment of suitable crematoria. In the warming of schools the architect, whether official or otherwise, should secure the help of a specialist engineer not wedded to a costly system, and the ventilating arrangements should be on lines of simple construction, with a view to renewing the full supply of fresh air whenever the rooms were in use. The need for cheap houses was nearly as great in rural districts as in towns. In the country the want

### HOUSING REFORM.

Next week of August next the International Congress on Housing Reform will meet for the first time in Great Britain. Seven congresses have been previously held, viz. 1893; Antwerp, 1894; Bordeaux, 1895; Brussels, 1896; 1900; Düsseldorf, 1902; and Liège, 1905. The President of the Congress will be the Prime Minister, Sir Henry Campbell-Bannerman, and the Vice-President, the Archbishop of Canterbury, Lord Carrington, Earl Crewe, Mr. A. J. Balfour, Mr. Arthur Balfour, Mr. George Cadbury, Mr. W. H. Lever, M.P., Mr. Booth, Sir John Dickson-Poynder, M.P. The session of the Congress will be held in London, and anticipated that the president of the Local Government Board, the Right Hon. John Burns, will officially open the delegates.

First notice of the Congress now being despatched to the members of the Congress are thus described:—

Regarding the Congress the members of the International Housing Committee are confident that great good will result from the gathering together of statesmen and housing reformers from the principal countries in order to consider the best methods of dealing with the housing problem. The interchange between countries of successful remedial action will alone be of service, and it is hoped that the housing legislation of other countries will be greatly helped and stimulated as a result of the deliberations of the Congress.

Notice of invitation for the Congress is very wide. To send official representatives have been sent to Governments of France, Germany, Austria, Belgium, Italy, Sweden, Norway, Spain and other European countries, the United States, South America, Japan, &c., and Governments of British Colonies, the provincial County Councils of the above-named countries, associations formed for the purpose of promoting the welfare of the working classes, sanitation, &c., local

authorities throughout Great Britain and Ireland, workmen's associations, especially co-operative and other societies interested in the housing question. A number of ladies and gentlemen specially interested in the subject will also be invited to attend the Congress. The subjects to be considered by the Congress include housing inspection, slum improvement and slum destruction, house-building and management, housing finance and taxation, the land question, town planning and building by-laws, transit, rural housing, &c.

In one respect the Congress will probably be unique, for at the special wish of a large number of delegates from other countries a special housing tour will be arranged to visit housing schemes in London, block dwellings and cottages; Richmond, cottages; Sheffield, cottages; Liverpool, dwellings for the very poor; the village of Bournville, Birmingham; Port Sunlight, Birkenhead; the village of Earswick, York; Garden City, Letchworth; cottage exhibitions at Sheffield and Letchworth, &c. A special train will be chartered to accommodate the delegates desiring to take part in the visits to Sheffield, Liverpool, Port Sunlight and Bournville. The organisation of the Congress has been undertaken by the National Housing Reform Council, the secretary to the Council, Mr. Henry R. Aldridge, acting as secretary to the Congress, and a special committee has now been organised to give the visitors from other countries a fitting reception. This committee is composed of the representatives of the Mansion House Council on Dwellings of the Poor, Rural Housing Association, First Garden City, Garden City Association, National League for Physical Education and Improvement, Royal Institute of Public Health, Tenants' Co-partnership Housing Council, &c.

### COST OF TRANSIT.

EVIDENCE was given before the Royal Commission on Shipping Rings last week by Mr. R. MacLaren, of Glasgow, a director of the Glasgow Chamber of Commerce and Manufactures. He said that deferred rebates were in restraint of trade and thereby injurious to it and the interests of the country. He would mention with regard to South America four contracts in which his own firm

National Telephone: 161 OLDHAM.

were interested. One was an Antofagasta contract for 26,000 tons cast-iron pipes, for which they were prepared to submit tenders which would have worked out about 8s. per ton cheaper than the offers which were accepted, but as they found the buyers were bound to the conference by heavy rebates on other cargoes shipped during the previous twelve or eighteen months they only submitted an f.o.b. offer. The result was that their f.o.b. offer for one-third only was accepted. The offer of another Glasgow firm for one-third also was accepted, and the remaining third was lost to Glasgow. For a contract for Manaos of about 12,000 tons pipes the firm had a rate of freight about 12s. from Glasgow below what the lines quoted from Liverpool were. An extra 5s. per ton was demanded to take the pipes from Glasgow. The firm prepared a c.i.f. offer which he took to the buyers, who said they could not entertain it unless he undertook to ship by the lines. He knew this was useless, and the firm never submitted their offer. For a Bahia Blanca contract of 34,000 tons, for which their tender was accepted, the freight quoted by the lines was 30s. per ton. They got the goods carried under 20s. by steamers A1 at Lloyd's. Tenders were asked for a quantity of between 60,000 and 70,000 tons of pipes delivered at Rio, but the conditions of tender as to payment and reception at Rio were so onerous that it was necessary to act through merchants in Rio and London. They had a rate of freight about 13s. per ton cheaper than the lines quoted, but unfortunately the firm of merchants through which they were acting found it necessary to add several thousands of pounds to cover the rebates which they would lose by using our offer. The result was the order was lost, three-fourths of it going to a Belgian firm. It certainly all would have come to Glasgow if it had not been for the large sum the merchants added to cover loss of rebates on other work altogether during the previous year. In India for four or five years the lines had given a preference to the east coast over the west coast, the reason being a disagreement between one of the lines trading on the east coast and the other lines. It was a matter of no importance to the merchant whether the goods came from the east or west coast, Germany, England or Scotland, as he merely added his profit, and if he could get a larger profit by selling German goods he unhesitatingly took it. The

manufacturer was by the situation of his works send the goods from one point, *i.e.* the nearest ship to his works. Further, the manufacturer's capital was at least a large portion of it, was sunk at his works was tied there, whereas the most of the merchant was in a comparatively liquid form.

The matter first came under his notice in connection with a contract for Calcutta about August 1900. He quoted the London merchants f.o.b. Glasgow. The merchants told him that while his offer was right it could not base on it, as they had a cheaper freight from Middlesbrough. The gross rate was the same, but a 5 per cent. discount was given from Middlesbrough, a worse port than Glasgow. The Bombay Merchants required tenders for about 4,000 tons of pipes. He had arranged to do the business through London merchants. They were looking after the freight, &c., so he did not trouble with it. He was in London at the time and was more than surprised when the merchants told him that although his prices were right there was no possibility of going in on the tender, as freight from the east coast was 2s. 6d. per ton cheaper. He said that was nonsense and promised to give them a c.i.f. offer. He wired his brother in Glasgow, who at once went to the lines. They informed him that the best they could do was 18-inch pipes, 22-inch pipes, 27s. 6d.; 24-inch pipes, 27s. 6d.; 30-inch pipes, 35s. He then went to some outside brokers and offered an overhead rate of 25s., on which the firm made a profit. The merchants immediately asked if they would do it by the lines, and on their replying that they could not be bound to do so the merchants wrote:—"As we are not out of considerable sums which would be forfeited if we were to become interested, either directly or indirectly in shipment by a non-conference steamer, we cannot accept your offer." The offers were put in. Two days afterwards the lines wrote that they would reduce the rate of freight to 23s. 9d. net overhead, but the damage was done. The order was lodged, and the order was lost. Another example of the rebate system in connection with the Indian lines was that places like Dundee, which formerly would take up a cargo and send it direct, were now forced to send the goods to Glasgow, and then by the lines at much higher rates.

## NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

## EDITORIAL NOTICES.

One of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

## TENDERS, ETC.

\* \* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

EDINBURGH.—The Garden City Association (Scottish branch) invite architects and others to submit schemes for laying-out as a model suburb the ground in the neighbourhood of Edinburgh over which they have acquired an option. Conditions of competition may be obtained from the Hon. Secretary, 23 Rutland Square, Edinburgh, on payment of a deposit of 10s., 5s. of which will be returned on receipt of a bona-fide set of plans.

IRELAND.—July 20.—The County of Cork Joint Hospital Board invite competitive plans for a sanatorium for consumptives with accommodation for seventy patients. A prize of 100l. will be paid for the plans which the Board may adopt, provided that said plans are sanctioned by the Local Government Board, and said plans shall become the absolute property of the Board. Intending competitors will receive a map of the site and other information on sending P.O. for 10s. to Mr. E. J. Murphy, secretary of the County of Cork Joint Hospital Board, Court House, Cork.

ROTHERHAM.—July 26.—Designs for new secondary school for girls. Premiums of 100l., 50l. and 25l. for three first designs. Assessor Mr. E. R. Robson. Further particulars from Mr. Spurley Hey, clerk to the Governors, Education Offices, Town Hall, Rotherham, Yorks.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

## CONTRACTS OPEN.

ACKWORTH.—July 13.—For whole or separate tenders in connection with erection of new school. County Surveyor's Office, Shire Hall, Durham.

WARRINGTON.—July 16.—For the erection of buildings for boiler plant extension. Deposit 1*l*. 1*s*. Mr. F. V. L. Mathias, borough electrical and tramways engineer, Howley, Warrington.

WEDNESBURY.—July 17.—For erection of a building for a generating station and for certain extensions and alterations to existing buildings at the electricity sub-station, Camp Street. Deposit 2*l*. 2*s*. Mr. W. Fennell, Corporation engineer, Camp Street, Wednesbury.

WEST BURTON.—July 17.—For alterations at West Burton school. Mr. Ramsden, schoolmaster, West Burton.

THE Manchester City Council early in the spring adopted new building by-laws intended to improve the quality of houses and enlarge the air space around new dwellings. These by-laws were sent to the Local Government Board for consideration and ratification, and have now been returned. Several alterations have been suggested, and the improvements committee will meet at an early date to consider them.

IN connection with the forthcoming visit of the National Association of Master House Painters and Decorators of England and Wales to Liverpool in September, it has been arranged to hold an exhibition of decorative and applied art at St. George's Hall. This will be the second occasion on which the National Association has visited Liverpool and had a Liverpool man for its president. This year the presidential chair is filled by Mr. G. H. Morton. Space at St. George's Hall has been placed at the disposal of the Association's school of art and of the technical school for a display of the works of the students, and it is expected that a very interesting exhibition will result in each case. A feature of the Liverpool exhibition will be a series of decorated exhibits by local decorators.

## TRADE NOTES.

THE new Public Library, Chester Road, Highgate, has been ventilated on the "Boyle" natural system under the direction of Mr. W. Nesbit Blair, M.I.C.E., borough engineer.

WE have much pleasure in announcing that the proprietor of the Bexhill patent casement window has appointed Messrs. Campbell, Smith & Co., of 25 Newman Street, Oxford Street, London, sole licensees and manufacturers.

THE British Flooring Company have secured the extensive wood-block contract for the new White Building, Market Street, Sheffield. Messrs. Gibbs & Flockton are the architects, and Messrs. J. Vasey & Sons, builders. They have also secured the contract for parquet floors at Messrs. W. Saville & Co.'s new premises, Enfield.

MESSRS. JOYCE & Co., Whitchurch, Salop, have been favoured with the order for a large striking clock for the Sunderland Corporation tramways offices. They are also making a similar clock, with four dials, 5 feet diameter, for Llanidloes public building, which is being erected at the expense of Mr. David Davies, M.P., and a large quarter clock for Broughton-in-Furness Church.

MESSRS. THOMAS FALDO & Co., LTD., the well-known manufacturers of asphaltes, inform us that they have opened offices situated at Effingham House, Arundel Street, Strand, W.C., where all communications should in future be addressed. Messrs. Faldo's business was established as far back as 1851, and with its steady growth this change has become advisable.

MESSRS. MARPLE & GILLOTT, iron and steel merchants and constructional engineers, of Coronation Buildings, Attercliffe Road, Sheffield, write us that they have turned their business into a private limited liability company, and in future it will be carried on under the title of Marple & Gillott, Ltd.

WE have been requested to announce by Messrs. Taylor & Co., the manufacturers of patent cloak-room fittings, of Carlton House, 28 High Street, Birmingham, that this branch of their business has been transferred to a limited liability company, which will in future be known as Taylor's Cloak-Room Fittings and Engineering Co., Ltd., with offices at 10A Burlington Chambers, Lower Temple Street, Birmingham.

## VARIETIES.

THE plans committee of Aberdeen Town Council sanctioned the plans of a new telephone exchange for the city, the value of which is estimated at 12,000l. The premises are to be erected in Bonaccord Street.

SIR WILLIAM MATHER has presented to the Council of Manchester a large number of books, Parliamentary reports and reports on technical education, forming the library of the National Association for the Promotion of Technical and Secondary Education.

THE tramway committee of Edinburgh Town Council recommend the following tenders by Messrs. Dick, Kerr & Co., Ltd., for cabling Broughton Street and Gilmore Place Roadwork for the lines, 34,785l.; for special work at points and crossings, 2,596l.

THE Croydon Borough Council have unanimously decided to confer the honorary freedom of the borough on Mr. William Ford Stanley, of South Norwood, in recognition of his public services and munificent gifts to the borough. He has erected at South Norwood two halls, an art school and technical trade schools.

MR. WILLIAM SAPCOTE, Camden Street, Birmingham, formerly president of the Midland centre of the National Federation of Master Builders and of the Birmingham Master Builders' Association, who died on March 1, 1916, left property which has been sworn at 19,107l. gross, 16,732l. net.

MR. JOHN MORGAN, one of the best known builders in the North of Scotland, has just died in Aberdeen at the age of sixty-three. Among the many public buildings with which his name will always be associated is the magnificent extension of Marischal College, opened by the King in September, and of which he was the contractor.

THE Caledonian Railway Company have entered on an extensive improvement scheme at Eglinton Street, Glasgow. This, when completed, will give a double track line from Glasgow Central to Rutherglen Junction. A distance of 600 yards is involved in the extension, which involves an outlay of about 80,000l. The operation will extend over a period of about two years. The contractors for the whole work are Messrs. Robert Morrison & Sons.

147 STRAND, LONDON, W.C. (FIRST FLOOR)

Chester education committee have decided to build a school in the Boughton district to accommodate 650 scholars, and to purchase a site for a school to supersede the City Wesleyan infants' school and the St. Barnabas's school, which have been condemned.

A meeting of the works committee of the Southampton Board the tender of the Tilbury Dredging Co. for deepening the channel in Southampton Water was recommended for acceptance, the price being just £1000. The work consists of making the channel from the Docks to west of the Thorn Knoll a uniform depth of 12 ft.

A report on the audit of the accounts of the Islington Council the district auditor of the metropolitan Council says that the charge made for electric current used to the street lamps, apart from the cost of the lamps, or maintaining the lamps, &c., is at the rate of 1s. 6d. per unit, or about twice as high as the average charged in other metropolitan boroughs.

"Calendar of Wills Proved in the Vice-Chancellor's Court at Cambridge (1501-1765)" is now at press and will be published shortly by H. Roberts, 2 Free School Lane, Cambridge. The Calendar contains records of the wills of R. Prior, Ferne Cowde Castell, and others. The work is issued in octavo, and a limited number in quarto, for which early application is desired.

H. R. HOOPER, M.Inst.C.E., Local Government Inspector, attended at the Norwich Guildhall for the purpose of holding an inquiry into the application of the Norwich Town Council for powers to borrow £25,000 for the purpose of their electricity undertaking. Mr. F. N. Hooper, electrical engineer, explained the work consisted of the purchase of new plant, meters and mains, and the work rendered necessary by the increased demand for electric current in the city.

HARRISON HODGSON, of Workington and of 15, Cavendish Street, London, civil engineer and contractor, largely connected with railway and engineering enterprises in South Africa and South America, died on May 11, aged fifty years, third son of the late Harrison Hodgson, contractor, of Workington, left estate

of the gross value of £76,853. 4s. 3d., of which the net personalty has been sworn at £75,189. 15s. 7d.

THE Borough Polytechnic annual sports and garden party took place on Saturday, the 6th inst., at the Institute Ground, Redpost Hill, S.E., where a large number of students, officials and friends assembled to witness or take part in the lengthy programme of varied events, which were carried out in good style and form, and at the termination a number of prizes were presented to the winners. Mr. C. T. Mills, principal of the educational department, was present on the occasion, and the secretary, Mr. W. M. Richardson, took a prominent part in the proceedings, which awakened lively interest throughout.

At a meeting of the Blackburn Rural District Council on July 6 a member raised the question whether the Council should insure all the men working for them when many were already insured by those who employed them on contract work. The clerk advised that it would be better to have a double insurance than to run risks. The whole of this workmen's compensation question, he said, was in a fog. Insurance companies did not know where they were, nor did anybody else. The Council decided to insure for twelve months.

DENBEATH and Buckhaven schools are virtually started, and the Board hesitates whether to appoint one or two clerks of works for the operations. An ex-provost holds strongly that one good man could superintend them both, seeing they are so near to each other. On the other side it is argued that if they must have one man for East Wemyss, where the school would cost £8,000, they must have two for the schools which would cost £20,000 between them. It was agreed at a meeting recently to advertise for one man, but to recommend the Board to elect two.

THE Lewes Town Council have adopted a scheme for the construction of an intercepting sewer to discharge the whole sewage of the town lower down the river and at ebb tide only. The estimated cost of the scheme was:—High-level intercepting sewers, £3,908. 10s.; low-level intercepting sewers, £3,186.; sewage disposal works, £5,860. 10s.—total, £12,955. This estimate did not include purchase of land, easements and wayleaves, or engineering or legal charges, which might be roughly estimated at, say, £3,200.

Works: 48 OSNABURGH STREET, LONDON, N.W.

Show Rooms: 67 ST. PAUL'S CHURCHYARD, E.C.

188 PICCADILLY, W.

MR. J. THOMSON, burgh engineer, Dundee, has prepared a design for new municipal buildings to be erected on the site of the town house buildings, the adjoining properties being purchased to increase the site. The cost of the building will be 80,000*l.*, or with the property 140,000*l.* Shops are proposed on the lower storey. The consideration of the subject was deferred by the councillors.

SIR WALTER FOSTER, M.P., has received the following communication from the Prime Minister in reply to an inquiry:—"His Majesty's Government are fully alive to the importance of this question, and my right hon. friend may be assured that it is their intention to introduce legislation dealing with the better housing of the working classes at the earliest practicable moment. I may add that no effort on their part will be wanting to frame a measure which should be adequate to the necessities of the case."

MR. HALDANE has just presented to Parliament a statement of the progress reported in providing for the technical instruction of soldiers to fit them for civil life in accordance with the War Office letter of October 31 last. It is suggested that barrack repairs might more often be carried out by men other than the Royal Engineers, whether under Royal Engineer supervision or by giving petty contracts to the regiment, and finally there is a suggestion that men should be encouraged by their officers to do odd jobs, such as repairing windows, putting up shelves and making minor conveniences for barracks.

MR. H. SHELFORD BIDWELL, C.E., inspector of the Local Government Board, held an inquiry recently at Lichfield in reference to an application by the Corporation to borrow 3,826*l.* for purposes of sewerage and sewage disposal. The sum was required for the following purposes:—(1) Sewerage extensions in the city, in addition to those for which a loan of 7,000*l.* had already been sanctioned—1,759*l.*; (2) additional filter beds and alterations and additions to sewage disposal plant—1,400*l.*; (3) erection of two workmen's cottages at the sewage farm—350*l.*; (4) purchase of land in Beacon Street for dealing with storm water—250*l.*; (5) legal charges for mortgages, &c.—67*l.*

A DEPUTATION from the Associated Chambers of Commerce waited upon the Home Secretary on Tuesday to urge

the advantage which would accrue to the public powers of coroners were extended to enable them to inquests in regard to fires. The Home Secretary sympathised with the objects of the deputation. At a future time he thought a Bill would be introduced with the whole question of coroners' powers. In that case his Department would whole-heartedly support the Bill. A short time ago the Home Office sent a deputation to the great municipalities, but the replies of Liverpool, Manchester and Bradford were unfavourable, and he suggested that these corporations should be converted in accordance with the principle of the Bill as soon as possible.

## CORRESPONDENCE.

### Income Tax Reduction League.

SIR,—We, the undersigned members of the committee of the above-named League, request you to publish this letter. The Income Tax Reduction League has been formed because we feel that the time has arrived when this tax should no longer be maintained at a war rate. Income tax is essentially an emergency tax, and we consider the prolonged maintenance of the tax at a war rate unsafe from a national point of view, unwise from a revenue point of view, injurious to our trade and industry, and unjust to a large body of the citizens of this country. The League is a non-party body. Its objects are to represent the forces of income-tax payers of all parties and of all sexes in one strong association, whose efforts to effect a substantial reduction of the rate. 2. To impress upon our countrymen the necessity of a substantial reduction of the rate. 3. The restriction of income tax to profits actually received by shareholders by individual traders, and to exempt depreciation from the operation of the tax.

Offices are being taken, and an organising secretary and staff are being engaged for the purpose of giving p

terrible fire in a Glasgow lodging-house a committee of the Corporation investigated all the circumstances. Among their recommendations one was that the walls should be made of a non-inflammable material, and in the event of those being made of wood, that they should be coated with an approved fire-resisting paint. Under the direction of the city firemaster a series of exhaustive fire tests were undertaken, with the result that the "Duresco" paint has been approved of and is now being used for the painting of all wood and other surfaces in lodging-houses in Glasgow. The agents for Scotland and the West are Messrs. James Duthie & Co., Glasgow. The paint has undoubtedly fire-resisting qualities, but its chief advantage is its appearance as a paint, which is the principal consideration. This is shown by the fact that the coloured discs of sixty-four decorative stock samples are issued of a size which enables anyone to select the colour and to select the colours which are most suitable for the particular case. The Silicate Paint Company are anxious about their customers and the public. It is therefore

desirable to have it stated whether the paint is to be used for new plaster or for other classes of work. Three coats of "Duresco" will produce work of the highest class, and more is never required. The company also manufacture petrifying liquid for preserving walls of all kinds from damp. The long period during which "Duresco" has been in use establishes its durability and covering power and easy working.

AMONG the earliest efforts to introduce economy in the use of coal and to increase the heating power in grates, besides making them subserve in ventilation, were those invented by Messrs. Shorland, of Manchester. They still continue to assert themselves, although the competition has vastly increased. In many schools where economy was a primary consideration—for there was no Government grant in those days—the Marchester grate was considered by masters and pupils as a friend. It still is made in forms which are adapted for schools, hospitals, &c. But Messrs. Shorland have also recognised the necessity for appearance, and they now produce grates which would not be out of place in a mansion where every article in the room has an artistic character. Several of their varieties are illustrated and explained in their new catalogue, and it will be seen that art has supplemented science to an extent that is satisfactory. Illustrations are also given of their patent exhaust roof ventilators. Among the buildings in which the Manchester stoves are used is the Royal Victoria Infirmary, Newcastle-on-Tyne, which was opened a year ago by the King.

The following regulations have been made by the Home Secretary as to examinations of a workman by a medical practitioner provided and paid by the employer under the provisions of the First Schedule to the Workmen's Compensation Act, 1906 :—

1. Where a workman has given notice of an accident or is in receipt of weekly payments under the Act, he shall not be required to submit himself, against his will, for examination by a medical practitioner provided by the employer except at reasonable hours.

Works, MANCHESTER. Salford Ironworks, MANCHESTER.  
Queen Anne's Chambers, Westminster, LONDON.

2. A workman in receipt of weekly payments shall not be required, after a period of one month has elapsed from the date on which the first payment of compensation was made, or if the first payment is made in obedience to the award of a committee or arbitrator, from the date of the award, to submit himself, against his will, for examination by a medical practitioner provided by the employer except at the following intervals:—Once a week during the second, and once a month during the third, fourth, fifth and sixth months, after the date of the first payment or the award, as the case may be, and thereafter once in every two months.

Provided that where after the second month an application has been made to the county (in Scotland, the sheriff) court or to a committee for a review of the weekly payment, the workman may be required, pending and for the purposes of the settlement of the application, to submit himself to one additional examination.

### PAINTERS' BRUSHES.

A MEETING of master brushmakers was held on June 25 to consider proposals for a simultaneous advance in the price of brushes generally. Thirty-two firms from London and the country, representing all branches of the trade, were present, and a similar number who were unable to attend wrote expressing their approval of the objects of the meeting. Four firms wrote that they agreed with the proposals, but awaited the results of the meeting before coming to a decision. The general feeling of the meeting was favourable to an immediate advance in the price of all brushes made of bristles and bristles mixed with horse hair, as the steady increase in the cost of every material used in the manufacture of brushes during the last eighteen months has compelled manufacturers to revise their prices. The following resolution was unanimously adopted and signed by the chairman of the meeting, Mr. Ernest N. Kent:—"That an advance of 5 per cent. in the prices of painters' brushes be made, to take effect on July 15, on all bristle and all hair painters' brushes. Orders to be accepted only for delivery within one month from that date."

### WINCHESTER CATHEDRAL.

THE timber foundations, which have caused the removal of the Early English addition to the east end of Winchester Cathedral, yielded several fine beech trees. Some were sound after their long burial and soot, earth and water. Those that are adapted will be converted into ornamental and useful articles for the benefit of the repair of the structure they failed to support. Dean and Chapter have given a fine block to the Natural History Museum, which has had fixed to it a copper plate with the following inscription:—

"This section of a beech tree, given to the museum by the Very Rev. Dr. Furneaux, Dean of the Cathedral, was, with other timber, taken 1906 from the foundations of the retro-choir, built by Godfrey of Bishopton 1189-1204, whilst being made safe by Francis C.E., T. G. Jackson, R.A., J. B. Colson, F.R.I.B.A., Thompson (Peterborough), Edwin Long (clerk of the Cathedral), Charles Ferrar (foreman). It has been under water 700 years, and its age must be at least 800 years. De Lucy's tomb is in the midst of his work, and round it in earth, tombs, chantries and shrine-like coffers of bones of illustrious prelates, statesmen and warriors of the thirty-five kings of the lineage of Cerdic, who made Winchester their capital, there are twenty kings and of the royal Saxon line, two Danish kings, three princes and one queen. For over 1,300 years praise have ascended to heaven from the cathedral and its predecessors. May the historic structure be preserved to God's glory 'till the day dawn.'—CHALONER SHENTON, W. H. JACOB, Hon. Curator; W. CHALKLEY, Curator."

### REDPATH, BROWN & CO., EDINBURGH.

ON Monday the members of the Royal Institute of Architects and others visited the works of Redpath & Co., Ltd., Albion Road, Edinburgh, a firm which is under the direction of Councillor John Cowan, has made in the last few years a specialty of steelwork for building and bridge construction purposes. The party, numbering between fifty and seventy gentlemen, assembled at eleven o'clock.

"It works admirably—takes ink and colour very well indeed."

TO BE OBTAINED OF THE PRINCIPAL DEALERS IN ARTISTS' MATERIALS THROUGHOUT THE

Mr. Cowan made an interesting speech. Brown & Co., with its works at Edinburgh, Manchester and London, was now, he said, one of the largest of its kind in the country. Twelve years ago nearly all structural work used in building construction came from Belgium. "Belgian beams," and little else, were employed in structural work in this country. He became associated with this firm he felt that this was a mistake, and he asked why this class of work should be produced in Great Britain. His firm thought they would give a try at it. They began in a small way; they were as they gained experience, and now he was able to say that for every 100 tons that came from Belgium of manufactured steel into Leith in the past five years not one ton to-day. They had kept them out of the country they meant to do so if they could in the future. He would like to see the Government could do that in the case of Belgium with manufactured steel, why should not the British rolling mills be able to keep up Germany out in the production of steel? He thought it could be done with the application of a little more capital to their work on the part of their British producers. He wanted their steel producers to wake up a bit.

Among other guests present were the Master of the Merchant Company (Mr. Grant), Treasurer Harrison, Mr. J. L. Ewing and Mr. Daniel M'Fie.

**BRICKWORK AND BOILER EXPLOSION.**

THE judgment of the Commissioners representing the Board of Trade, Messrs. A. A. Hudson and J. H. Hallett, in regard to the boiler explosion which took place at the works of Messrs. Hinks, Wells & Co., steel pen manufacturers, Buckingham Street, Birmingham, on November 10 last, was delivered at the Council House on Saturday morning by Mr. Hudson. According to the *Birmingham Daily Post*, he said the inquiry had extended over four days. The boiler which exploded was of the Kesterton type, now almost extinct, and was supplied by a Birmingham firm in 1876. It was set with two others, one a Kesterton and the other a Cornish, in a pit 9 feet deep. Of the earlier history of the boiler they knew nothing, but a few years ago it was insured with the Vulcan Boiler and General Insurance Company, of Manchester, and a working pressure of 50 lbs. was allowed, and later the pressure was increased to 60 lbs. The normal working pressure, however, was 45 lbs., and apparently on one occasion only, under special circumstances, had that pressure been increased. The method of the seating of the boiler had an important bearing upon the explosion, especially that part which came into contact with the outer wall of the shed. The boiler was examined from 1901 by Edward Robinson, an inspector in the service of the insurance company, both under working pressure and thoroughly. At the thorough examinations they had it in the evidence that, with one or two exceptions, the boiler was thoroughly cleaned and scaled by the owners, and reports and certificates for the purposes of complying with the provisions of the Factory and Workshops Act were given. In 1904, in consequence of a report from Robinson that there was considerable leakage, a patch was put upon the left lower drum of the boiler, and Robinson had stated that when he made his last thorough examination, on August 31, 1906, eleven or twelve weeks prior to the explosion, he did not notice that the patch was leaking. On the day of the explosion a pressure of 30 lbs. only was on the boiler. The explosion itself was not violent, merely blowing off about 6 feet of the brickwork covering the boiler, and a portion of the roof of the boiler shed. Two boys who were standing on the top were slightly scalded, but otherwise no one was

injured. Upon examination of the boiler after explosion, it appeared that the third ring of the left drum had been ripped longitudinally, and that the thickness of the tear had worn down to the thickness of paper. The patch on the top of that drum had been considerably, and although it was possible that extensive corrosion thus caused was not noticed on the occasion of the last examination, that together with the metal coming into contact with damp bricks had caused the explosion. They had been told that the hammer-test, the drilling-test and the hydraulic-test had been unsatisfactory, and the reason for that was that the defective parts of the boiler were hard against the bricks. The Commissioners were agreed that if the bricks had been removed the defects would have been noticed, and they thought the plate which exploded might have been away with the bricks. The inspector, Robinson, a qualified man, and had given his evidence satisfactorily. He had pointed out the defects of the boiler from time as far as he was able to judge them, and, taking into consideration the nature of his reports in conjunction with the nature of his instructions in regard to the nature of brickwork, they were pleased to acquit him of all blame. The owners, too, had willingly afforded facilities for the examination of the boiler, and they were blameless, but, in regard to the insurance company, they were different. Out of consideration for their clients, the insurance company—through their engineer, Mr. Crosland, that it was in a common sense impossible to expect clients to go to the expense of removing the brickwork unless there was some suspicious or warrant such a requirement. It was from his own statements, which agreed with those of the Board of Trade inspectors, that no test which he suggested would have disclosed the defects which were in this boiler while the brickwork remained in position. Yet, as chief engineer, he had not required its removal because he had customers' views to consider. The Commissioners, upon the evidence, said there was no doubt that portions of the brickwork should have been removed, and the fact that they were not removed rendered the use of the boiler in an unsafe condition. Mr. Crosland was a competent person under the Factory Act, and

ought to have exercised his judgment as an apart from the policy of the company. They did do it, but so far as the lower portions of the re concerned they could only describe them as and it was only a coincidence that the explosion e on the left side and not on the right. They that it had withstood any pressure at all.

ux, the solicitor to the Board of Trade, in reply to missioner, said the cost of the inquiry would e between 200*l.* and 300*l.*

rosland, in mitigation, mentioned that he had is whole life to the study of boilers, and he only fair to himself and to his company to point was due mainly to him that the Government had he examination of boilers. He had been more an anyone to lengthen the life of boilers, and suggestions had been acted upon the percentage ons had decreased from something like one in ie in 100,000. He had spent thousands of pounds ag his inspectors with testing apparatus, and he gone to the length of publishing a work in order greater safety. With due respect he submitted nsure upon himself might be withdrawn, and at hat he might not be fined. He also suggested ght have been warned as to what examination sary before the faults of the policy he adopted, i were adopted by other insurance companies, visited upon him.

udson said the Commissioners were perfectly hat they could lay down no specific rule in the removal of boilers. They were convinced ought to be such examinations. The very fact, case, that they had on the inside pitting  $\frac{1}{8}$  inch corrosion on the outside  $\frac{1}{8}$  inch deep on a plate the ckness of which was but 5-16 inch, ought to have necessity for the removal of brickwork to ascertain thickness of the plate. It was the safety of the 7 had to consider, and if the policy of removing ork had been adopted that accident would have ented.

land made another appeal to the Commissioners ound that at the most he had made an error of

Mr. Hudson said they could not accept it as an error of judgment, because he himself had made it an argument, and they ordered him to pay 50*l.* and the insurance company 100*l.* towards the cost of the inquiry.

#### L.C.C. WORKS COMMITTEE.

NOTICE has been given by Mr. Salmon that he proposes to move in the London County Council:—"That, in the opinion of the Council, no work should be executed without the intervention of a contractor unless it can be shown that a saving would be effected upon the price at which a contractor would carry out the work; that in order to enable the Council to determine, in any case, whether the work can be executed more economically without the intervention of a contractor, it is necessary for the works committee's estimate of the cost to be prepared, delivered and dealt with in the same manner as, and concurrently with, offers or tenders received from outside persons and firms; and that the general purposes committee do report what amendments are necessary in the standing orders, and in the orders of reference to committees, for the purpose of giving effect to this resolution."

#### QUALITY MARKS ON TIMBER.

THE stencil or hammer-marks placed by shippers on the ends of deals, battens and boards exported to foreign countries indicate the various qualities into which the goods are sorted. This year the Swedish shippers have assimilated the marks for the English market with those hitherto in use for the Continent only. In the new edition of the *Timber Trades Journal* "List of Shipping Marks" full particulars of the new Swedish designations are given, and the book has otherwise been brought up to date. The list of agents for various stocks and the recent changes in the shipping marks are duly recorded. This useful volume, of which many editions have been published in the course of the last half century, has become an indispensable book of reference to timber merchants and all large buyers of wood. The maps and charts add materially to the usefulness of the book. It is published at 7*s.* 6*d.* by William Rider & Son, Ltd., London, E.C.

### A DOUBLE-DECK BRIDGE.

THE largest bridge now in course of erection in the United Kingdom is the double-deck structure being carried across the river Wear at Sunderland. This bridge, which has a total length of close upon two miles, accommodates upon its lower deck a roadway for public traffic, with footpaths outside of the main girders, while on the upper platform the structure is being made for a double line for the North-Eastern Railway. The bridge, which has been designed by Mr. Charles A. Harrison, the chief engineer of the North-Eastern Railway, is at a high level, the headway for the river traffic under it being 85 feet, which was rendered necessary because of the shipbuilding industry carried on above as well as below the site. Long spans in the approach viaduct were adopted, as the riverside sites are specially valuable. On the north side there are two spans of 200 feet, in addition to a long viaduct of masonry arches, and on the south side one span of 200 feet, the girders across the river having a clear span of 330 feet.

The first interesting innovation in connection with the construction of the work, says the *Glasgow Herald*, was associated with the lowering of the foundation piers; but in view of the great experience and originality of Sir Wm. Arrol & Co., Ltd., who are responsible for the building of this as of many other large bridge structures, one is no longer surprised at novelties. One of the piers was built on the shore with a simple cofferdam of sheet piling to exclude the tidal water, but for the other pier it was necessary to proceed in the now generally accepted method of sinking under compressed air, and with the assistance of superimposed weights, of a large rectangular caisson, which in this instance had a length of 63 feet and a breadth of 35 feet. This was sunk for the very considerable depth of 44 feet. Usually after such a caisson has been founded on its ultimate bed, a cofferdam of timber is erected around the caisson to enable the masonrywork of the upper part of the pier to be built in place, but early in the work it was decided to build the masonrywork on the top of the caisson while it was being sunk, and the spectators had the remarkable spectacle presented to them

of masonry being built layer upon layer without any considerable advance being made in the height, because a layer was put on the excavators in the working chamber the bed of the river were clearing out the material, thus the whole structure was steadily sunk into the river until a sound foundation was reached. Ultimately the mass thus lowered into position weighed 10,000 tons, the total height from the foundation to the stones on which the girders will rest being over 100 feet. This work completed, the erection of the girders which have been constructed at Glasgow was proceeded with the steel structure for the land spans was erected in the way on a staging, but a novel scheme has been devised as a consequence of the ingenuity and practical experience of Sir William Arrol and Mr. A. S. Biggart for effecting quickly putting the immense river spans into position.

The river girders are to be built from both land simultaneously as overhanging members until they meet in the centre. This was somewhat the procedure at the Forth Bridge, but there the structure was designed primarily to be of the cantilever type. At the Sunderland bridge scheme had to be devised in order to support the overhanging member during erection, and this will consist of a temporary tower built over the top of the pier, having its upper end ties securing it back to the land girders by corresponding ties stretching forward and downward to various points of the river girder, so that there is thus constituted a temporary cantilever in the style of the iron structure across the Firth of Forth. Staging will be used to the permanent girders for the work of erecting, riveting, and painting, and the details, as explained during the many of inspection, were the subject of compliment to the well-known Glasgow firm of bridge-builders.

An idea of the magnitude of the undertaking is conveyed by the statement that in the structure 9,000 tons of steelwork have been used, while 40,000 tons of Norwegian granite have been utilised for the exclusive of 60,000 tons of red sandstone, mostly from Dumfries, and nearly 400,000 bricks. In the banks up to the approach viaduct there are 300,000 cubic yards of material. The masonry has been carried out by Messrs. Mitchell Brothers, of Glasgow, as sub-contractors to William Arrol & Co., Ltd.

ew of the many difficulties which are certain to arise in  
connection with the law, practice rules and procedure under  
the Workmen's Compensation Act, we have added to our  
staff A VERY EMINENT BARRISTER, who has  
made the subject a special study, and will be glad to answer  
in the columns of this paper any questions relating to the  
complicated matters arising from the provisions of this  
difficult Act. Our LEGAL ADVISER will further  
answer any legal question that may be of interest to  
our readers. All letters must be addressed "LEGAL  
ADVISER," Office of "The Architect," Imperial Build-  
ings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications  
as brief as possible. The space we can devote to Corre-  
spondence will not usually permit our inserting lengthy  
communications.

The Editor will be glad to receive from Architects in London  
and the Provinces results of Competitions and Tenders  
and other particulars of Works in progress in which they  
may be interested.

No communication can be inserted unless authenticated by the  
name and address of the writer—not in every case for  
publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must  
necessarily be held responsible for their contents.

## TENDERS, ETC.

appearance of Contracts Open, Tenders, &c., it is par-  
ticularly requested that information of this description be  
forwarded to the Office, Imperial Buildings, Ludgate  
Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

IRELAND.—July 20.—The County of Cork Joint Hospital  
Board invite competitive plans for a sanatorium for con-  
sumptives with accommodation for seventy patients. A  
prize of 100l. will be paid for the plans which the Board  
may adopt, provided that said plans are sanctioned by the  
Local Government Board, and said plans shall become the  
absolute property of the Board. Intending competitors  
will receive a map of the site and other information on  
sending P.O. for 10s. to Mr. E. J. Murphy, secretary of the  
County of Cork Joint Hospital Board, Court House, Cork.

ROTHERHAM.—July 26.—Designs for new secondary  
school for girls. Premiums of 100l., 50l. and 25l. for three  
first designs. Assessor Mr. E. R. Robson. Further particu-  
lars from Mr. Spurley Hey, clerk to the Governors, Educa-  
tion Offices, Town Hall, Rotherham, Yorks.

SCOTLAND.—The Town Council of Stirling invite com-  
petitive designs for proposed municipal buildings. Instruc-  
tions to competitors and plan of site may be obtained on  
application, accompanied by a deposit of 10s. 6d., which  
will be refunded on receipt of plans. Premiums of 50l.,  
30l. and 20l. respectively are offered for the best designs,  
which will be adjudicated by an architect assessor. Mr.  
David B. Morris, town clerk, Stirling.

WEYMOUTH.—July 30.—The Weymouth Town Council  
invite designs for a pavilion to be erected on the north side  
of the pier. One hundred guineas will be awarded for the  
selected design, such design to become the property of the  
Council. Mr. H. A. Huxtable, town clerk, Municipal Offices,  
Weymouth.

## CONTRACTS OPEN.

## TRADE NOTES.

MESSRS. FARNHAM, LTD., have obtained the contract  
the Honourable Society of Lincoln's Inn to clean the  
of the interior stonework of the entrance to the So  
dining hall.

THE Morrison Council schools, Liverpool, are  
warmed and ventilated by means of Shorland's patent  
chester grates.

MESSRS. W. POTTS & SONS have received instructi  
make and fix a new clock and bell in the new town  
Ilkley. Messrs. Potts made the parish church clock,  
sixty years ago for the late Lord Grimthorpe; als  
Congregational church clock and bell and Ilkley ra  
station clock, and are now making the South Shiel  
Ossett new town hall clocks and bells.

MR. ROBERT H. MEASURES, who resigned the char  
ship of Measures Brothers, Ltd., after the last g  
meeting, has now resigned the office of managing di  
though still retaining a seat on the board. Mr. Rich  
Measures has been elected chairman, and he an  
Herbert J. T. Measures have been appointed joint m  
directors.

These clients consult architects about the furnishing of houses. They have consequently a desire which should be recognised for upholding the style of such textiles introduced. Dyeing and cleaning must have interest for architects. It is possible to destroy the artistic effect of a series by either process. The system adopted by Mr. Harris is deserving of recommendation. Long experience and the perfecting of the "Barbe machine" are necessary to suggest his capability. But when it is added that he monopolises the principal work of theatres, no other person is needed of his power to make things appear surpassing attractiveness.

### ELECTRIC NOTES.

WRIGHT, JOHNSTON & M'KENZIE have written Johnstone Town Council on behalf of the Strathclyde Electricity Company, Ltd., that they intend making application for an order to generate, supply, sell and distribute electricity for public and private purposes within the burgh of Johnstone.

LONG-STANDING dispute between the Lambeth Borough Council and the South London Electric Supply Corporation has been settled, the Corporation undertaking to give the Council £1,000 worth of electric light free per year.

The Blairgowrie Town Council have received a letter from Messrs. Foote & Milne, electrical engineers, London, stating that they intend to apply to the Board of Trade, before December 21, for a provisional order to supply electricity within the burgh.

The Grimsby Corporation electric-lighting committee have advertised for tenders for an electric cable, with the result that a foreign firm quoted a price about 200% less than any British competitor. The prices became public, and the lowest British firm wrote suggesting that they would accept their price should opportunity be given them, and went on to say that every order placed abroad was "a nail in the coffin of the British electrical manufacturing industry." At a meeting of the committee at which this letter was read, an alderman described the letter as improper, and said that the dangerous precedent which would be created by an amendment of the tender be allowed. Upon a

vote being taken six voted for the foreign firm and six in favour of the amended tender. The chairman, saying "I'm an Englishman," gave a casting vote in favour of the latter. It was ultimately decided to advertise again for tenders, limiting competition to British firms supplying British-made cables.

### VARIETIES.

THE Gaiety Restaurant and Hotel in the Strand will shortly, it is said, be offered for sale. The area of the site is nearly a quarter of an acre.

THE Belle Steamers announce that in order to meet the convenience of passengers, more particularly on Sundays, the starting time of the Nore steamer from Fresh Wharf, London Bridge, has been altered from 2 to 2.15.

MR. WILLIAM G. R. BOUSFIELD, who has been for the last seventeen years associated with Mr. William Dunk as Dunk & Bousfield, architects and surveyors, of Billiter Square Buildings, is a son of Mr. E. H. Bousfield, of Messrs. Fox & Bousfield, 99 Gresham Street.

THE Kilmarnock Town Council last week considered a scheme for the sewage disposal at an estimated cost of £35,000, the plans having been prepared by Messrs. Shaw & Morton, C.E., Glasgow. The Council approved of the scheme, but resolved to proceed with it only in sections.

THE clock for the new clock tower, St. George's Circus, has been made by Messrs. Gillett & Johnston, the well-known tower clockmakers of Croydon, the makers of the clocks at St. Saviour's Cathedral, the Law Courts, St. James's Palace, &c. It is of the most modern construction and embodies every improvement essential to accurate time-keeping. The escapement is of the "gravity" type, whilst the pendulum is "compensated" against all variations of temperature. The wheels are all of machine-cut gun-metal and the pinions of steel cut from solid bars. The dials are four in number and each measure 3 feet 3 inches in diameter.

THE Littlehampton Urban Council have, after thirteen years' discussion, come to an agreement upon the adoption of a drainage system for the neighbouring village of Wick. The successful scheme was prepared by Mr. W. L.

Barrett, and, together with contingent works, will necessitate an outlay of about 16,000*l*.

The first cargo of marble, amounting to 130 tons, from the Iona quarries, reopened after the lapse of centuries, has now been shipped to Belgium. Operations began in March, and work is now proceeding so as to fulfil orders, which are coming in fast. The quarries are on the west of the island.

The Kilwinning Town Council have adopted a recommendation for the erection of a town hall in conjunction with offices for the parish council and the water board. Mr. Hugh Thomson, Saltcoats, the architect, estimates the cost, including furnishings, at 1,851*l*. The site is at Byres Road.

At Whitley, a holiday resort near North Shields, it is proposed to build a pier 600 feet long, with an entrance hall and a concert hall midway along to accommodate about 500 people. It is also proposed to have landing stages at the end of the pier. The local authorities, it is understood, have been approached on the matter, and no opposition is expected from them.

The Commercial Department of the Board of Trade state that tenders are required to complete the quays of the northern lighter dock and other works at Antwerp, and for the construction of two swing-bridges over the Mahmoudieh Canal invited by the municipal authorities of Alexandria. Tenders addressed to the Administrator, the Municipality, Alexandria, Egypt, will be received up to September 18 next.

A new music-hall is to be erected in Sheffield, from the designs of Mr. Bertie Crewe, London, by Messrs. J. Parkinson & Sons, contractors, of Blackpool and Newcastle. Seating accommodation is being provided for 3,500 persons, and when full the place will hold over 4,000 people. It will be a two-tier house, circle and gallery, with accommodation for pittites on the ground floor. The main entrance will be in Cambridge Street.

A DISPUTE arose last year between property owners of Rawtenstall and the Corporation with regard to 5 per cent. charges made by the Corporation for the supervision of private street improvements. The property owners

appealed to the Local Government Board against the charge, and the Board have now given their award affirming the claims of the owners. The amount claimed by the Corporation was 925*l*, and the award given is 888*l*.

Six cases of nuisance from dense black smoke were reported to the Westminster City Council on the 11th, and statutory notices were ordered to be served. The nuisances complained of were:—The New Ritz Hotel, the Gaiety Restaurant, Hotel Cecil, Savoy Hotel, Oriental Hotel, Hanover Square, and the Charing Cross Hospital.

The Edinburgh Town Council have agreed to the following motion:—"That the Town Council being of opinion that municipal trading, unless in undertakings which are monopolies and involve interference with streets, is in principle and detrimental to the interests of the public, instruct its representatives on the Glasgow City Council to discourage the tendency of the Glasgow Corporation to compete with private traders in making streets and doing work at or under cost price."

The Poole Town Council has received the award by Mr. A. J. Ram, K.C., umpire in the arbitration between the Corporation and the Poole Waterworks Company. The purchase of the latter's undertaking at Poole, Dorset, the company put forward a claim of 152,000*l*, and the arbitration assessed the value at 88,000*l*. The umpire's award was 133,937*l*, to which has to be added a sum of 50,000*l*, which the Corporation is spending upon the works, and also the costs of the arbitration, bringing the amount up to about 200,000*l*.

At the quarterly meeting of the Derbyshire County Council reference was made to a special report by Mr. Horton, the county surveyor, on the main roads within the Council's jurisdiction, about which complaints have been made for many years. In this report the use of gravel was recommended, involving an expenditure of 100,000*l*. The surveyor also suggests that this should be regarded as capital expenditure, the outlay of 60,000*l*. being a matter of annual expenditure, while the remaining expenditure might be spread over a few years. The discussion of this report was postponed until the October meeting to allow of its consideration by the highways committee.

A LIST of ART PLATES published in "THE ARCHITECT" will be forwarded on application to GILBERT WOOD & CO. Ltd., Publishers, Imperial Buildings, Ludgate Circus, E.C.

WING to the scarcity of workmen's houses in Accrington, Messrs. Howard & Bullough, Ltd., who employ considerably over 3,000 hands, have on foot a scheme for building in the interests of their employees, a number of workmen's dwellings. The firm own land in the Spring district of the town, which would be available for building purposes, and although the scheme is not yet completed, it is understood that they contemplate the erection of something like 200 cottages, upon which their workmen will have first call.

It is announced that Bacup will contribute five-eighths of the cost of the secondary school and technical institute to be erected at Waterfoot at a cost of 26,000*l.*, and will install six-elevenths. There will be accommodation for 100 students, and the subjects to be taught will include spinning and weaving, boot and shoe manufacture, engineering, plumbing and decorating. The higher education committee recommend the County Council to approve the scheme, and that in order to enable the Corporation of Bacup to borrow the 26,000*l.* the County Council should undertake to guarantee any deficiency in the amount lent by Bacup and Rawtenstall's penny rate to meet the charge for interest on and repayment of the debt.

In connection with the report on factories and workshops during 1906, arrangements were made during the year for extended use of determinations of carbonic acid in the air as a test of respiratory impurity, not only in works for which a standard of ventilation is prescribed, but in factories and workshops generally. In all 2,845 air samples were taken and examined in 1906. The requirement of a comfortable temperature is closely allied with that of ventilation, and has required much attention, especially in rooms in which sedentary work is carried on. Special attention has been directed, more particularly in the summer months, to cases where articles of food are manufactured. Baking shows a great improvement, and other works are generally satisfactory, except in the case of small premises, some of which are structurally unsuitable for the processes carried on. The dirty condition of floors, however, is a matter of general comment by the inspectors. There has been a steady advance in exhaust ventilation for removal of dust and fumes, but progress is often retarded by the

neglect of occupiers to consult experts when installing the exhaust, or to keep it in good order when fitted.

THE Edinburgh Dean of Guild Court recently passed plans for extensions at the General Post Office, Edinburgh. These extensions form a continuation of the existing post office premises. The building to be erected will be to the east of the present one, behind the inland revenue offices in Waterloo Place, and will have a frontage of 150 feet to the railway, and of about 100 feet to Low Calton. The height of the building will also be about 100 feet. The additional space thus provided for post office work will be utilised for the telegraph engineering department and stores, for postal stores, for the parcels post department and for increased accommodation for letter sorting, for postmen and for telegraph and telephone purposes. At some future time, probably in a year or two, an additional extension in the shape of another storey to the present building will be proceeded with. The total cost of the work is estimated at 62,000*l.*

THE Exhibition at Earl's Court this year is known as the Balkan States Exhibition. Possibly no more delightful spot can be found in London on a fine evening than the grounds of the Earl's Court Exhibition Co. The exhibits are varied, as is usual in a show of this kind, but still there is much to interest the visitor; but the chief attraction is undoubtedly the music, from the fact that one of the crack military bands can always be heard. With pleasant gardens to sit in and listen to sweet strains of music, and with the knowledge that the catering is in the best possible style; that a dinner can be obtained that will hold its own in comparison with many of the best West-end hotels, or that a more modest meal may be enjoyed with comfort, it is not to be wondered at that this place of amusement is so particularly popular. The Exhibition this year may not surpass, but it certainly holds its own with any previous one for interest, and this will no doubt be proved by the crowds who will wend their way there during the next three months. To lovers of art the loan collection of pictures from the Balkan States will have particular interest. The English mind is apt to imagine that the Balkan States are peopled by a less civilised people than ourselves, but a visit to Earl's Court and a glance at Balkan art and workmanship will largely remove this idea.

**THE KLEINE FIREPROOF FLOOR.**

A FLOOR which is not of reinforced concrete and yet claims to be as strong and fireproof is something of a novelty nowadays. A reinforced brick floor, that is, courses of bricks with iron or steel tension bands placed in exact position, and in a way that insures their full strength, are the main features of the Kleine construction. Despatch in construction and lowness of cost are other minor points claimed. To lessen the dead load hollow bricks in place of solid bricks are more commonly used. By using hollow bricks the weight of the floor (over short spans up to 9 feet) is not more than 25 lbs. per foot super, resulting in considerable saving of steelwork. The fire resistance of the Kleine floors has been proved not only by the most rigorous tests, but even in actual fires. The special tests, however, recently at Edmonton demonstrated the reliability of the floor and its behaviour under fire conditions. The details of weight, construction and breakage, we may say, were most satisfactory, and in a future issue they will be given point by point as reported by the superintending architect to the Company.

**STEEL-CONCRETE CHIMNEYS.**

As the principal American firms of specialists in construction are fascinated by English possibilities, it was inevitable that sooner or later the Weber Company should appear among us. Their head offices are in Chicago, but they have also offices in all important American cities. They boldly accepted an extraordinary test, for the first commission they have undertaken is for a chimney at the Northfleet works of the Associated Portland Cement Manufacturers, Ltd. There if anywhere the qualities of works in concrete should be known. The chimney will be 247 feet in height and the diameter of the flue is 8 feet 6 inches. That is not an extraordinary height for a Weber chimney, for last year one was erected at Butta, in the United States, which is 352 feet high with a flue diameter of 18 feet. Vertical T-steel bars are employed of sizes which are proportionate to the height of the chimney. The concrete is laid with care and when completed the chimney is practically monolithic. The lower part consists of two shells which are carried to a height corresponding with the use of the

chimney. There is an air space of 4 inches between two, and then the inner shell is carried up to the desired height. In some cases a single shell chimney will serve. Messrs. Lyle's works at the Victoria Docks ten chimneys which already exist are to be demolished and a single Weber chimney 261 feet high, with a flue of the diameter of 20 feet, substituted for them.

**THE "CITY PRESS."**

ON Saturday, the 13th inst., the *City Press* was able to celebrate the jubilee of its foundation in 1857. To that purpose an eight-page illustrated Supplement of principal features of which are a review of the history of the Corporation of London and a trade retrospect for the past fifty years, was published. A sketch of the developments of the Guilds of London in that period, a chat with ex-Alderman Sir Andrew Lusk, Bart., now in his ninety-sixth year, are among the contents of the interesting number. Since its foundation the *City Press* has made for itself a unique position as the leading local newspaper of the commercial centre of the Empire. It has true to its title, and all lovers of the City must wish the *City Press* had started two centuries ago. The Editor received a large number of birthday greetings from men of note, representing all shades of opinion. The illustrations show in a striking way many of the changes that have taken place in half a century. A feature worth noting is that the *City Press* remains in the hands of Messrs. Collingridge (the fathers of the present paper, having established it fifty years ago); and also that it has published only a few yards from its original address.

At the next meeting of the Paddington Borough Council a resolution will be moved calling the attention of the Government Board to the proposed expenditure of 30,000 by the Paddington Board of Guardians in the erection of a training home for nurses, and desiring the central authority to withhold their sanction to the expenditure on the grounds of its extravagance.

**BUILDERS' BENEVOLENT INSTITUTION.**

sixtieth annual general meeting of the Builders' Benevolent Institution was held in the board-room, 132 Bedford Street, Strand, W.C., at 5 P.M., on Wednesday, July 10. Mr. T. F. Rider (past president), presided. The minutes of the last annual general meeting were confirmed and signed.

The following annual report was read and adopted:—In consequence of the continued serious depression in the trades of the building trade, the funds of this Institution have been materially affected during the past year, and an urgent appeal is hereby made to subscribers and donors to compensate, by their generous assistance, for the resulting loss from the bad times. The strictest economy has been observed in the administration of the funds, and the greatest care is taken in investigating all claims for help. Elections of pensioners took place in November 1906 and 1907, when five men and four women were placed on the committee being fortunate enough to be able to bring forward successful candidates. Widows of deceased male pensioners come automatically on the funds and their claims are in order according to the rules. There were thirty-three male and thirty-three female pensioners, receiving respectively 42% and 30% per annum in pension payments. Eleven pensioners (six male and five female) died during the past year, and burial allowances of £10 were made in cases where such grants were necessary. The committee desire to place on record its appreciation of the valuable services rendered to the Institution by the past president (Mr. J. W. Chessum) and his friends; by the trustees (Mr. F. J. Dove, Sir Arthur Charles Lucas, Bart., Mr. T. F. Rider, Mr. J. Howard Colls, Mr. T. Stirling and Mr. John T. Bolding); by the honorary auditors (Mr. J. T. Chessum and Mr. R. J. Ward, F.C.A.); and by the dinner guests.

The committee have the pleasure to announce that Mr. Frederick Higgs (Messrs. F. & H. F. Higgs) has accepted the position of secretary for the coming year.

The annual dinner will be held in the Whitehall Rooms, Metropolitan Club, Charing Cross, on Thursday, November 28, when the committee hope to see present a large number of supporters of the Institution.

The audited accounts for the year ending July 6, 1907, were presented and adopted.

The honorary auditors (Mr. R. J. Ward, F.C.A., and Mr. John T. Bolding) drew attention to the diminution of income and to the sale of 500l. of stock to meet expenses, the amount expended on pensioners exceeding the total income by 200l.

The following elections were made:—*President*—Mr. Frederick Higgs (Messrs. F. & H. F. Higgs). *Treasurer*—Mr. J. Howard Colls (re-elected). *Honorary Auditors*—Mr. R. J. Ward, F.C.A., and Mr. John T. Bolding (both re-elected). *Members of Committee*—Re-elected—Sir Arthur C. Lucas, Bart., Mr. John T. Bolding, Mr. C. Bussell, Mr. F. J. Dove, Mr. Basil P. Ellis, Mr. Hy. Northcroft and Mr. A. Ritchie, J.P. Elected—Mr. J. W. Chessum (past president) and Mr. James F. Parker.

Votes of thanks were passed to the past president (Mr. J. W. Chessum); the treasurer (Mr. J. Howard Colls); the trustees (Mr. F. J. Dove, Sir Arthur C. Lucas, Bart., Mr. T. F. Rider, Mr. J. Howard Colls, Mr. T. Stirling and Mr. John T. Bolding); the hon. auditors (Mr. R. J. Ward, F.C.A., and Mr. John T. Bolding); the committee, dinner stewards and vice-presidents.

**SMOKE COMBUSTION.**

At the dinner of the members of the Society of Chemical Industry, at Birmingham, Sir Oliver Lodge, in proposing the toast of "The Society," dealt in technical terms with the subject of combustion and smoke. He described recent experiments in the direction of heating boilers without emission of smoke, and said he was very hopeful of a method recently devised which proceeded on the right theoretical lines. The method was to be tried at the power station at Bournbrook, and at the same time the ordinary process was to be employed in another boiler with the same fuel and stoking. The main feature of the invention lay in taking the flame along an inner tube of fireclay, where the combustion could be completed, because the walls were red-hot, and those walls radiated heat to the boiler. The flame did not come in contact with the boiler. It was not extinguished, and the smoke was reduced to next to nothing.

**THE "DRAWWELL" GRATE**

WAS PLACED

**First in the Final Tests**

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

**N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.**

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent,  
where the "Drawwell" can be seen in action.

He emphasised that, because he regarded the smokelessness of the air as a most vital matter in the condition of the life of the people, especially in the towns. As long as smoke was found to be necessary for the economical heating of water or metals and other substances, smoke was likely to continue, but if it were found that better results could be obtained by conditions which favoured complete combustion and at the same time suppressed the smoke, then the atmosphere would begin to get clear. He had been preaching the theory of this for twenty years, and now he began to have hopes of seeing it put into practice.

### HOW "DUMPING" IS AIDED IN GERMANY.

THE order issued by the Federal Council on April 5, 1906, clearly defines and formulates the provisions governing the "improvement traffic" and in some respects places it on an entirely new basis. The legal character of this order (which has not in itself the force of law, but which represents merely the prescribed limits of an administrative decree) has still preserved unaltered the fundamental principle of the improvement traffic; the regulations do not divest the improvement tariff of its legally established character as a concession, a favour granted by the authorities; neither can these regulations disregard the principle on which the German customs system is based, a principle which leaves the decision respecting the improvement traffic in the hands of the German customs administration. The order of the Federal Council only extends the co-operation of this body (that is, as far as it is capable of extension in accordance with the Imperial Constitution) in the granting of an improvement traffic and concedes some long-desired facilities in the control.

The present legislation as to the regulations of the improvement traffic may be summed up briefly as follows:—

The highest fiscal board (the Ministry of Finance) of the Federal State concerned decides generally as to the admission or suspension of an improvement traffic and also grants the privileges of participation in the improvement traffic to each separate manufacturer. This authority may delegate its power to subordinate boards also for the so-

called "repairing traffic," *i.e.* the restoration or removal of damaged goods. The free import of goods for the purposes of manufacture, of completion, or of repair, with a view to their re-exportation (the so-called active improvement traffic), is permitted, if this promises material advantage to the industries concerned, and if it entails no important consequences to other home industries; further, it is permitted even when some small disadvantages to these are outweighed by benefits so much greater as to conduce on the whole to the furtherance of German prosperity. The free reimportation of goods exported from the country for improvement (the so-called passive improvement traffic) shall, according to a prescription relating to it in the German tariff law, only be permitted in exceptional cases and only when the improvement in question at the time be made in Germany either at all, or sufficiently, or in an inferior manner; further, it applies to experiments made for the purpose of a new manufacturing method or of new patterns. The improvement traffic be granted on the ground that its execution in the country would incur great extra expense; it must be limited to those goods that are to be re-exported after reimportation. The separate Federal States have no right of independent decision in individual or technical cases of improvement traffic. If the question, however, should be the establishment of a permanent improvement traffic not yet permitted within the German customs territory, the consent of the Federal Council is necessary before a permit can be granted.

If, for urgent reasons, an immediate decision is necessary, the fiscal board of a Federal State may act without the consent of the Federal Council, but it is bound to submit the decree immediately to this body and to withdraw it if it is vetoed. The Federal Council is further authorised to inquire as to whether the economic benefit derived from any already admitted improvement traffic warrants further admission thereof, and it may exercise this power of examination whether it has or has not granted the improvement traffic, and whether permanent or temporary improvement traffic has made the examination necessary. The Federal Council is further empowered to inquire into the benefit of improvement traffic admitted before the issue of an Order in Council.

# TONKS LTD.

the specially difficult question of identification, the treatment of which frequently gave rise to loud complaints, has been solved in a manner satisfactory to the merchants, and includes the removal of the burdensome control regulations. Only in the improvement traffic the regulations still strictly demand the recognition of the improved goods, while in the improvement traffic the recognition is demanded only as the manner of the improvement allows it. The with regard to depositing security, time allowance and amount of imposts are all formulated in the interests of the human export industry.

The indispensable preliminary condition for duty-free re-export traffic is the re-export of goods imported for re-export. If the export does not take place at all, or for a period allowed, duty must be paid for the goods imported for improvement; no respite in the payment of such duty is granted. Loss of material, due to waste or similar during the process of improvement in the country, material is proved to be valueless and exempt from duty according to the tariff law, is not subject to duty; other material is subject to duty. On the other hand, if goods have received dutiable additions in other countries duty must be paid for these additions upon reimportation. Over-charge caused by the working of textiles and paper by dyeing, printing, colouring and the like, is admitted free if official control seals are still on the goods.

### DOCK CONSTRUCTION IN ANTWERP.

Report on the shipping and navigation of the port of Antwerp, Sir Cecil Hertslet, Consul-General for Belgium, states the scheme which the Government of Belgium has adopted for the extension on a gigantic scale of the berthing accommodation of the port of Antwerp has been viewed with great interest by those concerned with projects for the improvement of other shipping ports. The Government has with regard to Antwerp are, indeed, worthy of notice which they have attracted, as when carried into effect the extensions will make of it certainly one of the largest, if not the largest, in the world. To some per-

sons the proposed enlargement on such a colossal scale of the docks and river quays already existing at this port may seem in a certain degree to be an exhibition of over-confidence in the future of Antwerp as a port for attracting the imports into Europe, and the manufactured and other goods which Germany and Belgium, and, indeed, the whole of Northern and Central Europe export; but it is evident that the shipping of Antwerp—which port is almost ideally situated for the purpose which it is intended to carry out from a geographical point of view—undoubtedly will continue to increase as it has done for so many years past, provided that there is sufficient accommodation for the large vessels with which it is now overcrowded.

At the time of writing, and for many months past, there has been a ceaseless and urgent demand for quay and dock space, which the municipal authorities allot in a very competent manner to the best of their ability; but even with the best management it has been found impossible during the last twelve months to satisfactorily deal with the overwhelming amount of shipping entering the port in such a manner as to enable vessels visiting Antwerp to load and discharge their cargoes with a minimum loss of time. The new intercalary docks have been flooded for some months, and should be open for the use of large craft in the course of the summer of this year. They will do much to temporarily relieve the present pressure of traffic and demand for quay space; indeed, the new docks will be by far the largest of any at Antwerp, their area being about 69 acres; but, as I have frequently said before, this alleviation will only be temporary. Again, it is not and never has been the intention of the Government to immediately proceed with the entire works of the extension scheme. The docks will be constructed one by one, as the demand for space increases, but it is estimated that, at the present rate of increase in the tonnage of the port, it will be necessary to commence as soon as possible the construction of part of the canal dock, and at least two of the corresponding subsidiary docks. In the original scheme of the Belgian Government for the extension of the port, the intention was to divert the river Scheldt from its present course, and to make a new bed, known as the "Grande Coupure," along the right bank of which were to be constructed 9,399 yards of river quays (*i.e.* a little more than  $5\frac{1}{4}$  miles). Previous

to the completion of these works a deep-water canal was to be excavated running parallel to the "Grand Coupure," leading from which canal nine large subsidiary docks were to be constructed, on its north side. The latter part of the scheme has been definitely accepted, while the decision as to the construction of the former remains in abeyance, pending the conclusions to be arrived at by a commission of experts, who are to examine the desirability and practicability of its construction.

Generally speaking, it is scarcely realised to what a large extent Antwerp owes its greatness as a port to British shipping. To all intents, so far as the actual tonnage of vessels is concerned, Antwerp is a British port; certainly the United Kingdom has a greater interest in it than any other country.

### INTERNATIONAL HOUSING CONGRESS.

THE International Housing Congress, which will open in London on Monday, August 5, promises to be a great success, and should exercise a most valuable influence on the housing reform movement in the United Kingdom.

The Premier has consented to act as président d'honneur, and the vice-présidents d'honneur include Lord Carrington, K.G.; Earl Crewe, the Right Hon. A. J. Balfour, M.P.; the Right Hon. John Burns, M.P.; the Archbishop of Canterbury, the Archbishop of Westminster (Dr. Bourne), the Chairman of the Free Church Council (Dr. Rendel Harris), the Chief Rabbi (Dr. Adler), the Right Hon. Walter Long, M.P.; the Right Hon. Henry Chaplin, M.P.; Sir John Dickson-Poynder, Bart., M.P.; Mr. Geo. Cadbury, Mr. W. H. Lever, M.P.; Miss Octavia Hill, the Chairman of the London County Council (Mr. H. Percy Harris), the Mayor of Westminster (Councillor G. W. Tallents), the Right Hon. Chas. Booth, the Marquis of Salisbury (president, Letchworth Model Cottage Exhibition), the Lord Mayor of Sheffield (Alderman R. Styring), Councillor Alfred Cattell, J.P. (chairman of the Sheffield Model Cottage Exhibition).

The President of the Local Government Board will welcome the delegates on the opening day.

The interest shown by the leading Churchmen is very great, and, at the invitation of the Dean, the Bishop of

Birmingham will preach a Congress sermon in Westminster Abbey on Sunday evening, August 4.

The delegates from other countries include:—Mr. Siegfried, whose name is associated with the Housing Law of 1903 (le loi Siegfried); Senator S. (Paris); Dr. Stubben, the leading authority on planning in Germany; Dr. Mewes (Düsseldorf); Pr. Albrecht (Berlin); Professor Fuchs (Freiburg); Pr. Mahaim (Liège); M. Lepreux (chairman of the International Housing Committee); Count Sabini and M. Vincent (Italy); Dr. Maresche, Professor Rauchberg and Ch. Von Furth (Austria).

Many important towns will be represented by burgomasters, and the Governments of Hungary and Belgium have already appointed representatives. The following English municipalities have already appointed delegates, e.g. Manchester, Salford, Newcastle-upon-Tyne, Exeter, Bristol, Sheffield, Birmingham, &c.

The gathering of British housing reformers will be an interesting one. Mr. Geo. Cadbury, Mr. W. H. M.P., Alderman Thompson (Richmond), Councillor Nettlefold (Birmingham), Mr. T. C. Horsfall (Manchester), Miss Constance Cochrane and many others will take part in the Congress proceedings.

The adherents to the Congress will enjoy the privilege of making a special housing tour under the most favourable conditions. They will receive a civic welcome at Southampton and Liverpool, and will be entertained at Port Sunlight, Bournville and Garden City.

Mr. H. RICHARDSON, Dundee electrical engineer, has completed the plans for a generating station at the South Gate. The buildings, which will be of brick on a steel skeleton, have been designed without any pretension to architectural effect, and with a view of limiting the expenditure as far as possible.

THE Lochgelly Town Council have decided to erect new municipal buildings on the present site. The accommodation is considered quite inadequate. The estimated cost is 2,000l. This signifies an assessment of 1l. per 17.

## JAMES CARTLAND & SON, LIMITED.

MANUFACTURERS OF EVERY DESCRIPTION OF  
Cabinet, Builders', Furnishing, & Naval Brass Foundry,  
BIRMINGHAM.

### MACHINE-MADE BRASS SOCKET BOLTS.

4601

Brass with Iron Shoot.

4602

With Iron Back Plate.

Made in three widths and all lengths.

WITH SIDE ADJUSTMENT FOR HEAVY FANLIGHTS. BRASS, 1751 1/3 each IRON, 1752 1/4 each

Hinged at Bottom, Opening In. Brass 1751 5/6 Iron 1752 4/-

For Pivot Sashes. Brass 1755 5/6 Iron 1756 4/-

Hinged at Top, Opening Out. Brass 1753 5/6 Iron 1754 4/-

The advantages of this invention will be appreciated by Builders, Architects, and others, as being a perfect Fanlight Opener, without the disadvantage of any unsightly part projecting into the room, to the impediment of blinds, &c. It is equally suitable for sashes hung at top, bottom, or pivot sashes.

ENDLESS COORD TO WORK.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.  
The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.  
No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.  
The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

THE Staffordshire County Council at their last meeting agreed on the acceptance of the tender of Messrs. T. & E. Cooke, Congleton, for 6,488*l.* for the erection of the new Council school at Biddulph; also the tender of Messrs. James Heath & Sons, of Leek, for 3,129*l.* for the erection of the Biddulph Moor Council school. The architect submitted sketch plans for Talke new Council school, and it was resolved to amend the plans by making provision for cookery instruction. The architect's sketch plans for Talke (Butt Lane) new Council school showing provision for 300 older children and 100 infants, for Brockmoor new Council school (268 boys), for Tutbury new Council school (208 girls and 100 infants) and for Shelfield (Brownhills) Council school (416 older children) were approved.

**SCHOOL HOOKS.**

As over 200,000 "Schola" cloak-room hooks have been fitted in 200 schools and institutions, it may appear to be enlarging on the evident by stating that these fittings are widely known and appreciated as a means for economising space and improving the sanitary conditions of cloak-rooms, where a large number of articles of wearing apparel

are deposited at one time. The list of public buildings so fitted is a formidable one, including the new General Post Office, Liverpool, for H.M. Office of Works; churches, schools, infirmaries, banks, &c. The accompanying illustration is testimony to the strength of the hooks. The manufacturers are Messrs. Brookes & Co., Ltd., 4 Cateaton Street, Manchester.

## TRADE NOTES.

ROAD schools, Maidenhead, have been ventilated "Boyle" natural system under the direction of J. Shrewsbury, architect, Maidenhead.

directors of John Oakey & Sons, Ltd., have declared dividend at the rate of 10 per cent. per annum Ordinary shares for the six months ending June 30. ds payable on September 2.

Norwich Town Council have approved the recomon of the sewerage and irrigation committee that the of the Columbian Fireproofing Company, Ltd., of William Street, London, E.C., to construct and lay h reinforced concrete rising main on the "Bonna" in accordance with the specification prepared by engineer for 9,988l. be accepted. It was stated that unt was several hundred pounds less than the esti- the city engineer.

E. C. YOUNG, of Bethnal Green, has contributed to den City exhibition at Letchworth a variety of un whitewood, hardwoods, pine planks, mahogany; rptions of square and round turning, especially and balusters, handrails, mouldings of almost every ion, three-ply in great variety, compoboard, over- pedestal seats, dining-table legs. A specialty is ne picture hanging rail at 5s. per 100 feet. Also balusters, &c.

Westminster City Council proposes to acquire, for onnection with the disposal of refuse, the freehold Grosvenor Canal and some adjoining property at a 0,000l.

## NEW CATALOGUES.

It is an exacting test for a shopfitter to prepare a shop for a jeweller. The contents being valuable and limited in size, care must be taken that they are not oppressed by the massiveness of the cases which contain them. At the same time safety has to be secured. Lightness and strength are among the first requirements. Beauty of form is also desirable, but it must be kept within bounds, for there should be no rivalry. Indeed, some jewellers appear to think that their wares should only be exhibited amidst a halo of artificial light, which would appear as supplementary but yet as allied to the gold and precious stones. The catalogue of Messrs. Parnall & Sons, Ltd., Bristol, reveals the anxiety to insure that whatever is exhibited shall be seen under the most advantageous conditions. They have avoided massiveness unless when it is required for the fronts of counters, and then care is taken by the adoption of panels to impart variety and light and shade. The woodwork is generally mahogany or other hard wood French polished. In some cases the bases are covered with hammered copper. Plate-glass is mainly used for the shelves as well as for the parts through which the valuables will be seen. The glass is sometimes bent, which allows variety and is, moreover, convenient in crowded shops. The workshops of the firm have been lately extended and electric motive-power and the latest woodworking machinery have been introduced in them. All that skill and experience, in combination with capital, can accomplish is available for the representatives of one of the most important of businesses.

WE have received the catalogue of Mr. S. H. Heywood, electric-power engineer, of Reddish, near Stockport, manufacturer of electric pulley-blocks, &c. The advantage of the electric pulley-blocks is that one man can do the same amount of work in less time than it takes three by the old hand pulley-blocks, and that no skilled labour is required in using them. Mr. Heywood informs us that they are being extensively adopted in shipyards, locomotive, electrical and general engineering works, and that in these days when so much attention is being drawn to labour-saving devices the adoption of the electric pulley-blocks should not be overlooked.

## VARIETIES.

PLANS are to be prepared and forwarded by the Lexden and Winstree Guardians, Essex, for the proposed increase of infirmary accommodation.

THE contractor for the new library and public offices about to be erected at Llanidloes is Mr. Lloyd, of Rhayader, as announced in an earlier issue. Messrs. Shayler & Ridge, of Oswestry, were the successful architects in a recent competition.

THE Willesden Board of Guardians have decided to build a new workhouse and receiving home for children, and application has been made to the Local Government Board for sanction to borrow the money required. Three ratepayers' associations in the parish are opposing the scheme.

THE Morecambe Town Council have decided, by fourteen votes to four, to take over and electrify the present traction on the sea front. One member said horse trams were an attraction and suited invalid visitors. The estimated cost of the reconstruction and electrification is 46,000*l.*

IMPROVEMENT schemes under the Labourers' Acts have been made by the Ballinrobe District Council at a total estimated cost of 61,380*l.*; Westport District Council, 20,341*l.* 7*s.*, and Killala District Council, 17,459*l.* 10*s.* Comprehensive schemes are also in course of preparation by the five other district councils in the county.

THE streets and buildings committee of the Edinburgh Town Council have agreed to recommend the widening of the bridge at Milton Road, Portobello, in view of the North British Railway Company doubling their line there. The estimated cost is 1,200*l.*, and the superiors have intimated their willingness to pay a fourth of the cost.

A NEW sensation has been provided at the Balkan States Exhibition at Earl's Court. It has in it something of the great wheel, the switchback and the water chute, but is unlike either. The orbit of the larger wheels which carry the car is eccentric, and imparts a peculiar movement which is undoubtedly popular. It is the invention of Mr. Robt. H. Bishop, and the framework and mechanism, which is ingenious, has been set up by Messrs. Hawksley, the well-known engineers.

A MEETING of the Street Noise Abatement Committee was held on Saturday, at which it was stated that the motor-omnibus and traction-engine traffic had in the course of two years depreciated the value of houses in London to the extent of fully 6,000,000*l.*, while last week was adding thousands of pounds to the loss being incurred by property owners.

THE Metropolitan Water Board have just appraised the estimate of 30,000*l.* in respect of pumping machinery for houses, &c., at Walton, on the recommendation of the works and stores committee. It was also decided to have some discussion as to designs to erect a water tower on the Board's land at Shooter's Hill, the estimate for construction being 5,000*l.*

MR. L. V. HARCOURT, appointed by the Board to inquire as to the probability of the river Dee being damaged by the operations proposed under the Bill, says any abstraction of water in the river reaches would damage the tidal part of the Dee, but could be remedied by dredging the river at an estimated cost of 316*l.* a year.

AT Tuesday's meeting of the London County Council after a long discussion upon the merits and demerits of the Council's works department, the highways committee was authorised to obtain tenders from selected firms, with sealed estimates from the works committee considered concurrently—for the erection of a portion of the central car repair depot, the Tooting ways sub-station and the first portion of the Bow car shed.

THE Mexborough Secondary school authorities have adopted the final plans of the new school prepared by the architect, Mr. J. E. Knight. The estimated cost of the building, including furnishing, fittings and boundaries, is 15,300*l.*, while the price of the site is 2,200*l.* This is to accommodate 346 scholars, which works out at a building cost of 36*l.* per head. Mr. Lee pointed out that the whole price per head was 50*l.* The architect is at Bishop Auckland and Castleford, where similar schools are being erected, the cost per head on these amounted to 37*l.* The plans were approved.

Price Two Shillings Office—6-11 Imperial Buildings, Ludgate Circus, London, E.C.

Model Cottage Exhibition at Wincobank, Sheffield, ve forty-two cottages, divided into three classes. cottages will contain two bedrooms, with living- and scullery, and must be built for 175*l.*; class B will ree bedrooms, and will cost 200*l.*; while the third ll include a parlour, with 225*l.* fixed as the maximum The exhibition will be opened during this week. On 8 the members of the International Housing Con- ill make a special visit.

Board of Trade report on the state of employment any, just issued, says that in May there was a con- ong demand for labour in the principal industries, ges in consequence showed an upward tendency. tch to the Foreign Office states that after the lock- been declared in Berlin on May 18 work was on only on those buildings where men were paid ob, or where danger to life might result from a il. In order to compel the workmen to yield, the ed mortar works bound themselves to supply mortar contractors who had received permission from the rs' organisation to continue working. On the nd, the workpeople decided only to work for those rs who agreed to fix the working day at 8½ hours ay 80 pfennigs (9½*d.*) per hour.

interesting housing scheme has been placed before ratives of a large Dundee shipbuilding firm. g to a circular issued by them on Saturday, it is d to erect within a few minutes' car ride from the wellings suitable for artisans and clerks. The will be semi-detached and detached two-flat each having ground to the extent of about 10 poles in front as a garden and in rear as a bleaching The houses could either be purchased or rented. after event the annual charge would be merely t to cover expenses and give a very small per- on the cost. The object of the circular is to test the ty of the idea, the employés being asked to state they are in favour of the scheme, whether they ent the house at from 12*l.* to 20*l.* per annum, or e right out, and whether they have any practical ons to offer.

THE general purposes committee of the Holborn Borough Council state that a nuisance having been reported at No. 112 Oxford Street, it was discovered that it was due to the fact that in the course of repair to the main sewer in New Oxford Street, some two and a half years ago, the out- let from the drain in question was bricked up by the work- men of the London County Council, the drain being sup- posed to be what is technically known as "dead." The committee are of opinion that henceforward, before any old drains are bricked up, greater care than appears to have been exercised in the present case should be taken to dis- cover where the drainage of the adjoining premises really does discharge itself, and a communication to this effect has been addressed to the engineer of the London County Council.

At the Wesleyan Conference on the 20th inst. Mr. R. W. Perks, M.P., said he was in a position to make a statement with reference to their site at Westminster and the church house. The cost of the site had been altogether 360,000*l.* They had already sold land to the value of 200,000*l.*, and they had still left 35,000 square feet for their own purposes, which was five times as large as the site of the mission- house. They had been paid 100,000*l.*, and they would have another 100,000*l.* within twelve months; they had still land that they expected would sell for 100,000*l.* The net result was that they had a site at Westminster that was worth 250,000*l.* which had cost them 60,000*l.* They had got out the foundations, and as the result they had been able to let contracts for the erection of buildings up to the floor on the most advantageous terms, and the work would be begun on the 22nd inst. and completed in about twelve months.

MR. H. SHELFORD BIDWELL, M.Inst. C.E., attended at the Birmingham Council House on Tuesday, on behalf of the Local Government Board, to conduct an inquiry relative to applications by the Birmingham Tame and Rea District Drainage Board for sanction to borrow money for the purpose of sewage disposal. It was explained that in 1903 the Board adopted the bacteriological system of treating sewage, and an experimental bed of one acre was laid down. There

were now  $15\frac{1}{2}$  acres of beds. One acre was capable of dealing with 750,000 gallons of sewage per day, and the normal flow of sewage was 24,000,000 gallons. Therefore they were now only able to oxidise half the normal flow. They were anxious to improve the existing conditions, and to lay down a further seven acres. For this purpose the Board desired to obtain sanction to borrow 45,000*l*. The new beds would be an extension of the existing beds, and the work would be adjoining. They asked that the repayment of the loan be extended over a period of thirty years.

THE chairman of the Worcestershire County Council at the last meeting, calling attention to the requirements of the new education code, said it was probable that no schools would be recognised except on the 10 feet basis of accommodation instead of the existing 8 feet, which will necessitate a large expenditure by managers of non-Provided schools. If they were unable to find the money the County Council would have to take over the schools or build new ones. Of the 250 schools in the county, H.M. inspector had already reported twenty-one for overcrowding, usually in the infants' departments; fifteen school premises were defective and would necessitate heavy expenditure; in five cases new schools would have to be built, or they would lose the grants; and in fifty-three cases orders had been given for the removal of galleries, which would necessitate structural alterations. In ninety-three cases the inspectors were calling attention to alterations needed in the floor space.

### AUGUST BANK HOLIDAY ON THE CONTINENT.

TICKETS at reduced fares available for eight days will be issued to Brussels July 31, August 1, 2, 3 and 5, and to Zurich *via* Harwich and Antwerp. Dining and breakfast cars are run between London and Parkeston Quay, Harwich, on the Antwerp service. Passengers leaving London in the evening reach Brussels next morning, after a comfortable night's rest on board the steamer. For visiting The Hague, Scheveningen (the Dutch Brighton) and Amsterdam for the dead cities of the Zuyder Zee, special facilities are offered

*via* the Great Eastern Railway Company's British Mail Harwich-Hook of Holland route. A corridor with vestibuled carriages, dining and breakfast cars on the Hook of Holland service between London and Harwich. From the Hook of Holland through and restaurant cars are run in the North and South express trains to Cologne, Bale and Berlin, reaching at noon, Bale and Berlin in the evening. For convenience of passengers tickets dated in advance obtained at the Liverpool Street Station Continental and Booking Offices. The Danish Royal Mail steamer the Forenede Line of Copenhagen will leave Harwich on the west coast of Denmark) on August 6 and 7. The General Steam Navigation Company's steamers will leave Harwich on July 3 for Hamburg, returning August 4 and 7.

### HAVE YOU SEEN ABOUT YOUR HOLIDAY?

Is the title of a pictorial poster by which the Great Eastern Railway Company draws the public attention to its arrangements for the holiday season, and an examination of their A B C programme demonstrates that this enterprising company has done everything possible to provide for the holiday traveller. For those wishing to visit the health resorts on the North-East coast, tickets are available every Saturday during the season, covering a period of three to seventeen days, for 17*s*. to Cleethorpes or Scarborough and Filey. Similar tickets are issued for West coast watering-places, viz. to Southport and Llandudno for 19*s*., to Blackpool, Lytham, St. Anne's and Fleetwood for 21*s*., and to Douglas (Isle of Man) for 23*s*. and 27*s*. 6*d*. Every Thursday cheap tickets for sixteen days are obtainable to all the principal health and pleasure resorts in Ireland. Cheap tickets are also issued every Saturday for three, six or eight days to over 400 towns and places in the Midlands, Yorkshire, Lancashire and North of England. The majority of cases the fare for an eight-days' ticket is less than a sovereign. Such low fare tickets are, however, offered to the detriment of comfortable and expeditious travel, as passengers are allowed to perform the journey

trains, composed of up-to-date corridor stock, and car is attached for the provision of meals on the a most reasonable tariff.

Those desirous of spending a pleasant day or week in the country facilities are announced suitable for all. There are day and half-day excursions to many spots in Herts and Bucks, and for the pedestrianist over forty tours have been arranged, many of covering fresh ground, now accessible by the opening of new suburban lines into Buckinghamshire. Lovers of the open air are given the opportunity of visiting Stratford-on-Avon four days a week at a special inclusive fare; a modest sum of 12s. 6d. the journey to Stratford is including two drives, luncheon and tea.

For Friday and Saturday week-end tickets, available on ordinary train, are issued to all the inland and holiday resorts, extending from the Midlands to the Scotland.

The arrangements are conveniently tabulated in the form of an A B C excursion programme, obtainable, free of charge, at Marylebone Station, N.W., the company's town offices, and at the numerous agencies situated throughout London and suburbs. Publicity Department, 216 Marylebone Road, N.W.

### VALUE OF SEASONED TIMBER.

The "Zeta" Wood-Flooring Company, Ltd., of Crispin's Marshgate Lane, Stratford, London, E., is a new company established for the carrying on business of wood-flooring manufacturers and workers in parquetry. The company was registered on May 14 this year. They have erected an up-to-date factory at Stratford which has been equipped with all the most modern machinery obtainable for the purpose of carrying on this industry. Owing to the support of the authorities of the West Ham Corporation, the company has been enabled to run the whole of their machinery by electricity. A few words of description of their works will doubtless be of interest to many of our readers. The works consist of two machine-rooms measuring 80 feet by 30 feet, and the entire installation has been completed (which shortly will be) the company will be in a position

to turn out some 200,000 yards of wood-block flooring annually. The premises have a water frontage of 280 feet, so that the timber is brought in by the ship and lighter direct to their works. This is an important point in any company, and the "Zeta" directors, who are all good shrewd men of business, have not lost sight of this fact. At the same time, the factory is in close proximity to all the goods depôts of the leading railway companies, thus enabling the "Zeta" company to despatch their goods promptly and cheaply to any part of the country. Perhaps the part that will be most interesting to architects and builders is the fact that the company have erected at some considerable cost desiccating chambers fitted with the most efficient and modern plant, so that all floors supplied and made by the company, whether under their first, second, or third schedule, will consist of the wood which has been thoroughly matured owing to this treatment. This enables the company to give a written guarantee for five years on all floors manufactured and laid by them. Although the business has been so recently founded, the company have secured several very large contracts; one at the present moment on which they are engaged is for a big factory in Brixton. A small, neat handbook has been prepared giving particulars of their floors in different classes, containing a price-list, the figures in which are based on the execution of high-class work.

### PLANNING AND GROWTH OF TOWNS.

At the last meeting of the Yarmouth Town Council Councillor Arnott and Mr. F. Milton Harvey (deputy borough surveyor) reported on their attendance at the Conference between the Association of Municipal and County Engineers and delegates from local authorities, at Liverpool. They stated:—"After full discussion the Conference decided unanimously against the present method of town growth, by the development of individual estates without reference to the requirements and planning of the whole town as a whole, the disadvantages of the present method being as follows:—(a) The laying out of each estate in such a manner as to prevent the develop-

ment of adjoining land, thus confining town growth to comparatively small and closely packed areas. (b) The planning of the largest number of houses, with minimum air space required by by-laws, upon estates nearest to town, frequently for the creation of ground rents and for securing the larger financial returns obtainable from small sites. (c) The difficulty of obtaining open spaces, sites for schools and public buildings, before value of land has risen by commencement of building operations. (d) The costliness of present method, having regard to the injurious effects upon health and life arising from overcrowded building land, to the probable future requirements as to street widths, and to the possibility of such closely packed areas being in the future regarded and treated as slum property. The Conference further agreed that efforts should be made to control or regulate the development of building areas immediately adjoining town boundaries and likely in course of time to become portions of such towns. Failing which, to urge upon the existing local authorities the adoption of the larger powers generally possessed by the towns affected. The Conference strongly disapproved of affording transit facilities to such districts unless development be placed under proper control. The Conference unanimously agreed that greater powers should be granted to local authorities to control the planning and future development of their towns, in order that, with due foresight and an accurate knowledge of each town's requirements, schemes might be arrived at in which each portion developed might be a part of a well-designed whole, full provision being made by main arteries for approach roads, motor and through traffic, for gardens and open spaces and sites for public buildings, due regard being paid to architectural effect. Further, that by power to limit the number of houses to the acre and prevent the overcrowding of building areas, some effect should be given to the aims of housing reformers by providing homes with abundant air space and pleasant surroundings. The Conference further urged that steps should be taken to put schemes in operation before the value of land is increased by the commencement of building operations. We desire to submit the recommendations of the Conference to your consideration, and respectfully urge their adoption in connection with the future development of the borough."

### THE NEW COUNTY HALL.

It may be assumed from the latest report of the element committee that the London County Council will not have the proposed county hall carried out as was imagined. An important part of the site is to be let on a lease which may extend to twenty years and an arrangement of that kind must seriously interfere with the building arrangements. The following report:—

We are giving careful consideration to the suggestion of the provision of a new county hall and we are in communication with the finance committee on the expenditure involved. One of the leasehold interests to be acquired is that of Holloway Brothers (London), Ltd., whose premises occupy 1.22 acre of the site and adjoin the Council's works and other premises. A notice to treat was in November 1905 served in accordance with an undertaking given by the London County Buildings Bill was before Parliament in the session of 1906, and a claim has been received. The Bill provides that the company shall remain in possession for three years from the date of the service of the notice to treat, which period will expire in November 1909, after which the company are in a position to compel the Council to take at once under the notice to treat. The Council has agreed to purchase the freehold interest from the Ecclesiastical Commissioners and the company pay the Council a rent of 1,430l. per year and the unexpired term of their lease is 72½ years.

In these circumstances we have considered the question which we can advise the Council to take at the present juncture. We have viewed the site, and having regard to its large extent, the gross area being 6.34 acres, in the area to be reclaimed from the river Thames by the new line for the embankment wall, in respect of which the Thames Conservancy are prepared to grant a license on certain conditions, we have negotiated an arrangement with the company with a view to an arrangement being made for their remaining in occupation for a term after the Council has acquired their leasehold interest under the notice to treat.

We advise that an agreement should be entered into with the company providing, *inter alia*, that the Council should proceed forthwith under the notice to treat to acquire the leasehold interest and to have assessed the cost of the same.

which the company would be entitled for trade disturbance, inconvenience on removal, &c. The sum to be for machinery, plant and fixtures is to be settled by on at the time possession is given. The payment leasehold interest would be made now, and the company could be granted a lease at a rent to be agreed for one years, terminable at the Council's option in years, and at the option of either party after ten or 1 years, on giving two years' previous notice, the representing the trade compensation, together with ation of machinery, &c., to be paid on the company possession. In the ordinary course the sum payable ect of trade disturbance would be due at some date er than November 1909, but under the proposed ent it will not become due until the determination tenancy under the new lease, or in 1914 at the During the term of the lease in addition to the rent of 1,430*l.* a year, the Council will receive a rent on the amount paid to the company in respect of sehold interest. In view of all the circumstances, e no hesitation in saying that the proposed arrange-desirable.

#### THE STRAND CRESCENT SITE.

Establishment committee of the London County Council ce that they have had a proposal for an option of a ninety-nine years, at a rent of 55,000*l.* a year, of the portion of the crescent site formed in connection : Holborn to Strand improvement. The site has an about 124,000 square feet, and lies between Aldwych Strand, being bounded on the east and west by the approaches which it is proposed to form between nd and Aldwych. It has frontages of about 636 feet ych, about 413 feet to the Strand, about 236 feet to roach on the west side of the site and about 231 feet n the east side. The proposal has been made by erard on behalf of a syndicate who have prepared a for developing the site as a whole. M. Gerard make a deposit of 5,000*l.*, which is to be forfeited vent of a building agreement not being entered into se of the site at a rent of 55,000*l.* a year within six of the date of the provisional agreement. lease will be in the Council's usual form, subject to

such modifications as may be necessary for the special undertaking, and will give the Council entire control as to the uses to which the buildings will be put, and also the right of re-entry if the buildings are put to any other use than that sanctioned when the lease is taken up.

The balance (50,000*l.*) of one year's ground rent will be paid as a deposit upon the signing of the building agreement; this deposit will be forfeited if the lease be not taken up, so that the Council's interests are adequately safeguarded.

Preliminary sketch plans have been submitted which show a scheme for the erection of shops with offices above fronting on to the Strand, the two side thoroughfares and a part of Aldwych. On the central portion of the site with a frontage to Aldwych it is proposed to erect a stone building of commanding architectural features. This building will contain large galleries for use in connection with a permanent exhibition of arts and manufactures; it will also contain a theatre, a concert hall and a restaurant with courts around. Since the sketch plans were submitted negotiations have been entered into by the promoters which may lead them to modify the scheme in the direction of erecting a different class of building in the Strand. This would materially assist in the development of the remainder of the Council's land, and would give even greater security for the ground rent than would be afforded by the erection of shops.

The minimum amount to be spent in the erection of these buildings is to be 500,000*l.*, and the buildings are to be completed within four years of the date of the signing of the agreement. The plans, elevations and specifications of all the buildings will be entirely subject to the Council's approval.

The promoters make their offer dependent upon their being permitted to apply for a license for the sale in the café, restaurant and courts of beer, wines and spirits to be served at tables by waiters, who will also serve other refreshments, but no bars are desired in connection with this part of the scheme. In the theatre such facilities for refreshment will be provided as are usually allowed in theatres licensed by the Lord Chamberlain. The lease will provide that these facilities will be afforded only while performances are being given in the theatre, and that they will

Queen Anne's Chambers, Westminster, LONDON.

be in strict accordance with the regulations of the Lord Chamberlain governing such cases. The part of the site to which the sale of alcoholic liquors is restricted will be defined on the plan attached to the lease when granted. The requirements in the matter of licenses will not be greater than those agreed to by the Council in the case of the letting sanctioned on March 20, 1906, to the syndicate of which Mr. L. Wormser was secretary.

The land has not yet been submitted to public auction, but adjoining sites have been offered on several occasions, and this has been sufficient to test the market, while the fact that the site was to be let on lease has been well advertised. The committee consider that the acceptance of the present offer will have a beneficial effect as regards the disposal of the Council's remaining surplus land.

#### AN ANGLO-CHINESE PORT.

THE British Vice-Consul, Mr. H. G. Parlett, has reported on the condition of Tairen, otherwise known as Dairen, Talien, or Dalny, in the Liaotung Peninsula. So far, he says, there has been no inrush of foreign merchants into the newly-opened port, which is scarcely to be wondered at, in view not only of the present state of uncertainty regarding the future of the place, but also of the disabilities under which, for the time being, all alike labour. In the first place, the regulations relating to the leasing of property are sufficiently vexatious to deter any but the most enterprising from investing capital. Land or buildings may, by the rules now in force, be confiscated at any moment at the discretion of the authorities, one week's notice being given in the case of buildings, one month's in that of land. In addition a lessee may not transfer his lease to another party, nor may he mortgage his rights as security for debt. It is not sufficient for the authorities to assure would-be lessees that the first of these conditions will never be enforced; the merchant naturally asks why, if this be the case, the objectionable rule is not struck out.

Of Tairen itself little is to be said. Outside the Russian administrative quarter there are scarcely any solid foreign-built houses, and the few that exist are mostly relics of the days of the Russian régime. The Japanese are, it is true, erecting buildings in fair numbers, but these, almost without

exception, leave much to be desired both in the quality of their workmanship and in that of the materials used. The greater part of the town, which was planned by the Russians on a very ambitious scale, still remains waste ground. Such streets as do exist are occupied almost entirely by Japanese or Chinese shops and dwellings of a poor and squalid description. This remark applies even to the busiest streets. The probable explanation is that the capital has so far been invested in the place, the amount of Japanese investors having been monopolised by an extraordinary revival of trade and industries proper immediately after the war. It would also be the case that the rate of wages and the price of materials is so much higher here than in Japan that the cost of building is far short of double what the Japanese are accustomed to pay. Finally, there is the uncertainty of tenure referred to.

#### BUILDING IN SAN FRANCISCO.

THE Board of Trade have received information from a trustworthy source to the effect that building in San Francisco is fast approaching stagnation owing to the high price of material and a fear of further demands for higher wages by the artisans. The labour situation appears to have reached a point where the supply is far greater than the demand, and under ordinary economic conditions the competition for employment would cause a reduction of wages were they not artificially supported by the unions. Long wages can be upheld by these agencies remains to be seen. For the 40,000 men reported to be idle, the probability of obtaining employment in other cities on the coast does not appear to be encouraging. One of the largest construction companies in the city reports that it has contracted to erect forty-two new buildings of all sorts, but no work has not been begun on account of the outlook for rising wages. Meanwhile, the decline in the cost of building material appears to be general. Brick has fallen 5 per cent, per 1,000, lumber has declined from 6 to 10 dollars per 1,000 feet and is expected to go lower; lime and cement and wire-lath have all dropped materially, and only structural steel remains stationary with no immediate prospect of change.

EDITORIAL NOTICES.

w of the many difficulties which are certain to arise in  
connection with the law, practice rules and procedure under  
the Workmen's Compensation Act, we have added to our  
staff A VERY EMINENT BARRISTER, who has  
made the subject a special study, and will be glad to answer  
the columns of this paper any questions relating to the  
complicated matters arising from the provisions of this  
difficult Act. Our LEGAL ADVISER will further  
answer any legal question that may be of interest to  
our readers. All letters must be addressed "LEGAL  
ADVISER," Office of "The Architect," Imperial Build-  
ings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications  
as brief as possible. The space we can devote to Corre-  
spondence will not usually permit our inserting lengthy  
communications.

The Editor will be glad to receive from Architects in London  
and the Provinces results of Competitions and Tenders  
and other particulars of Works in progress in which they  
may be interested.

No communication can be inserted unless authenticated by the  
name and address of the writer—not in every case for  
publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must  
necessarily be held responsible for their contents.

TENDERS, ETC.

\* \* As great disappointment is frequently expressed at the non-  
appearance of Contracts Open, Tenders, &c., it is par-  
ticularly requested that information of this description be  
forwarded to the Office, Imperial Buildings, Ludgate  
Circus, London, E.C., not later than 2 P.M. on Thursdays.

TRADE NOTES.

Bath Stone Firms have supplied the Whitbed Port-stone used in the London and Provincial Bank at rich, of which the architect is Mr. T. W. Cotman and builder Mr. Fred Bennett, both of Ipswich.

THE Newellite Glass Tile Co., of Shenton Street, Old Kent d, have obtained the contract for the tiling at Messrs. and & Wolff's new premises at Southampton, for h the Waring-White Building Co. are the contractors.

A LARGE clock with Westminster chimes has just been ted in Casterton Church, Yorkshire, by Messrs. John h & Sons, Midland Clock Works, Derby. It is fitted all the latest improvements, and is generally to the gns of the late Lord Grimthorpe. The same firm are now making a large clock for Windermere and one for ish Town, London.

MESSRS. WM. POTTS & SONS, LTD., clock-makers, of Leeds Newcastle, have received instructions from the Countess ount-Edgcombe to erect a new clock with chimes and external dials at Lamesley parish church. They have just completed new clocks at North Bovey Church, near ton Abbot, and Kingley Stoneclough, near Manchester, are now erecting the memorial clock to the late Earl of brook at Low Moor, Bradford, Yorks.

TILE MANTLES.

MESSRS. GEO. WOOLLISCROFT & SON, LTD., of Hanley, Staffs, the old-established firm in the tile industry, are now introducing slabbed-tile mantels to suit their numerous patterns of tile-surrounds. The appearance is very effective. They are being produced in rich plain enamel
